The FAA operates 219,122 miles of airways which are 10 miles wide and extend between altitudes of 700 and 24,000 feet. The airways are served by 35 air route traffic control centers, which provide en route guidance to aircraft flying on instruments and maintain 300 airport towers for terminal traffic control. These facilities are linked by 157,652 miles of interphone lines and 113,587 miles of teletype circuits, through which the air traffic control data are transmitted.

Key navigational aids along the federal airways are the VOR's (very high frequency omnidirectional radio ranges) and the VORTAC's (combination civil VOR and the military tactical air navigation system, TACAN). By June 30, 1959, the FAA had in operation 592 VOR's and 52 VORTAC's.

To aid the FAA's air traffic controllers in monitoring flights along the federal airways, the FAA has stepped up its long-range radar installation program. In addition to the five long-range radars operating in 1958, 29 systems became operational in the fiscal year 1959, and 20 more were scheduled for commissioning by July 1, 1960. These high-powered radars are capable of detecting aircraft within a 200-mile range and up to 60,000 feet in altitude. Also, as a result of FAA-military cooperation, FAA personnel have been stationed at 28 Air Defense Command radar sites to give radar advisory service to the civil air carrier jet aircraft flying on the three jet transcontinental routes between the 17,000 and 22,000-foot altitude limits.

The FAA's airport surveillance radars, which can detect aircraft within a 50–60 mile radius up to altitudes of 25,000 feet, now number 47 operational units. By the end of 1961, 82 will be in operation.

These and other facilities, including the instrument landing systems, high-intensity approach light systems, and several newly installed "electronic brains" which are taking over the routine arithmetical functions of the air traffic controllers are the FAA's means for handling more efficiently the ever-increasing numbers of civil and military aircraft crowding the federal airways.

E. R. QUESADA,
Federal Aviation Agency Administrator.

FEDERAL BUREAU OF INVESTIGATION. The Federal Bureau of Investigation, with headquarters in Washington, D.C., maintains 53 field offices in major cities throughout the United States and in Puerto Rico. This investigative arm of the U.S. Department of Justice is strictly a fact-gathering and fact-reporting agency and neither evaluates the results of its investigations nor makes prosecutive recommendations. Charged with investigating violations of certain specific federal laws and collecting evidence in such cases, the FBI presently has jurisdiction over more than 150 federal matters encompassing both general criminal investigations and domestic intelligence operations.

The very nature of the FBI's work in the internal security field, of course, precludes publication of its highly confidential activities. Since 1939, however, the FBI has been vested by presidential directives with primary responsibility for combating internal enemies of the United States and with the duty of correlating internal security investigations. Nationwide in scope, this authority embraces investigative jurisdiction over subversive activities, espionage, sabotage, treason, violations of the Atomic Energy Act, and related domestic intelligence functions.

As the largest single subversive organization in the United States, the Communist Party, USA, is an integral part of the international Communist conspiracy which represents a threat to freedom. Recent activities reflect a renewed feeling of confidence and optimism throughout the party. Using blackmail, bribery, and similar techniques, Communist agents, many of them cloaked with diplomatic immunity, have stepped up their efforts to obtain the nation's military, scientific, and industrial secrets. Their primary targets are the establishment of a new Communist youth group and infiltration of American labor organizations and basic industries—particularly the automobile, steel, and railroad industries. Growing public complacency toward these Communist conspirators, continuing success of the Communist Party in employing legal technicalities and delays to thwart the interests of justice, and increasing boldness on the part of Soviet and satellite espionage networks—all contribute immensely to the investigative problems of the FBI.

In addition to the FBI's intensive efforts in the domestic intelligence field, the volume of investigations and accomplishments in the general investigative field continues to be high.

During the 1959 fiscal year, convictions in cases investigated by the FBI rose to 11,719, representing 97.4% of all persons brought to trial. Of these convictions, 93% were persons who pleaded guilty to the crimes with which they were charged. Sentences resulting from these convictions totaled 32,019 years, and six life sentences and fines totaling $1,421,141 were imposed. In addition, the FBI located 9,090 fugitives from justice, and savings and recoveries resulting from FBI investigations totaled $133,986,959. Included in the property recovered in cases investigated by the FBI were 16,957 stolen automobiles.

Cooperation with local, state, and federal law-enforcement agencies continues to be a major phase of the FBI's operations. On request, the services of the FBI Laboratory and the FBI Identification Division are available without cost to law-enforcement and to other federal agencies. Technicians in the FBI Laboratory handled 36,812 requests for assistance during the 1959 fiscal year. These requests involved 184,993 scientific examinations of 162,918 specimens of evidence. Each working day throughout the fiscal year, the FBI Identification Division received 19,713 sets of fingerprint cards—a total of 4,987,362 for the entire year. Fugitives identified through fingerprint comparisons totaled 16,435. At the close of the fiscal year, the Identification Division files contained a total of 152,594,022 fingerprint cards of all types, representing 74,791,407 individuals.

Also, on request, the FBI assists in training officers of municipal, county, and state law-enforcement agencies. In response to invitations from local authorities, the FBI participated in 2,556 local police training schools during the 1959 fiscal year. Two sessions of the FBI National Academy in Washington, D.C., were held during this period, bringing the total graduates to 3,722. More than 28% of these graduates currently hold positions as executive heads with their respective departments or agencies.

Regional law-enforcement conferences sponsored throughout the United States are also an integral part of the training program of the FBI. These gatherings serve as a medium for the mutual exchange of ideas and the analysis of pressing crime problems, and facilitate better understanding and closer cooperation among the participating agencies.

In addition to the annual law-enforcement conferences, the FBI also conducts annually a series of special conferences dealing with specific aspects of the crime problem. During the 1959 fiscal year, the FBI conducted special law-enforcement conferences across the nation dealing with such subjects as organized crime and racketeering, and bombings and threats of bombings against educational and religious institutions.

Among the other services of the FBI are the publication and distribution of pamphlets, charts, posters, and other printed materials dealing with various aspects of the crime problem and law enforcement.

The best known and most widely circulated of these publications are the *FBI Law Enforcement Bulletin* and the *Uniform Crime Reports* bulletin—both issued on a regular, periodic basis. The *FBI Law Enforcement Bulletin,* published monthly, contains editorials and articles relating to various aspects of the crime problem and investigative work. In addition to providing information concerning new trends and developments in law enforcement, it serves as a medium for the exchange of ideas throughout the profession. The *Uniform Crime Reports* bulletin provides a statistical analysis of the crime problem based on reports submitted by law-enforcement agencies throughout the United States. Police agencies voluntarily participating in the Uniform Crime Reporting Program represent over 97% of the nation's population.

(See also CRIME.)

J. EDGAR HOOVER,
Director, Federal Bureau of Investigation.

FEDERAL COMMUNICATIONS COMMISSION. The commission's regulatory activities in its 25th year of operation (fiscal year 1959) reflected both the substantial progress made in electrical communication in the past quarter of a century and continuous United States world leadership in this field. During the FCC's history, the number of radio stations of all kinds in the United States increased from 51,000 (in 1934) to over 507,000 (in 1959), and the number of broadcast receivers rose from 18.5 million to over 200 million (including 50 million TV sets), which represented two thirds of the world's total. Telephones in use, which numbered 17 million in 1934, totaled 70 million in fiscal 1959, or more than half of the world's aggregate.

The FCC received less than 10,000 applications of all kinds in its first year of operation and now handles nearly 600,000 annually. Its budget, which in 1934 was under $2 million, exceeded $9 million for the first time in the fiscal year 1959. The number of employees increased in the same period from 500 to 1,300. During fiscal 1959, Rosel H. Hyde was reappointed commissioner; John C. Doerfer was chairman of the FCC.

National Defense.—The FCC administers the CONELRAD (Control of Electromagnetic Radiation) program, designed to alert the nation in event of war, to thwart an enemy from using electrical transmissions as navigational aids for bombers and guided missiles, and to permit essential radio operations during an air attack. In cooperation with the Air Force and U.S. Weather Bureau, the commission utilizes the CONELRAD alerting system to warn the public about impending hurricanes, floods, and other natural disasters.

International.—Communication between the United States and 125 foreign countries is provided by four cable and six radiotelegraph carriers and one radiotelephone carrier. In fiscal 1959, international telegraphic traffic totaled about 22 million messages, and international telephone conversations, 2.7 million. International telegraph gross income increased to over $77 million in calendar year 1958; overseas telephone revenues, to $26 million. Another transatlantic telephone cable between Newfoundland and France was laid in fiscal 1959.

Common Carriers.—The $24 billion telephone industry (Bell System and about 4,000 independent companies) earned gross revenues approaching $8 billion in fiscal 1959. Dial telephone operation is possible on 94% of the Bell System and 80% of the independents; about 12 million subscribers can dial nearby points and another 8 million can dial long distance. In fiscal 1959 the Bell System, at the request of the FCC, reduced charges for interstate long distance calls by about $50 million annually.

Western Union, the domestic telegraph carrier, in the calendar year 1958 handled about 123 million land-line messages and grossed $240.7 million in revenues, a decline of $4.8 million from 1957. It operates 2,000 private-wire systems, 36,000 desk facsimile (Desk-Fax) machines, and a two-way telegraph system (Telex) between New York City and Chicago and with 24 Canadian cities. Its eastern microwave network was under extension in 1959 from Chicago to Kansas City.

Broadcast Services.—Broadcast authorizations for radio and TV stations (excepting remote pickup and other auxiliaries) numbered about 5,440 as of June 30, 1959. Of the 971 authorized TV stations, 566 commercial, 43 educational, and 158 translator stations were in operation. The number of TV channels reserved for education was 259. The FCC's ruling of Feb. 20, 1959, that news programs came under the "equal time" provision (Section 315) of the Federal Communications Act led to the passage of Congressional legislation specifically exempting broadcasters from the necessity of granting political candidates equal time facilities in certain news broadcasts. The commission requested legislation enabling it to authorize VHF (very high frequency) booster (repeater) stations under safeguards for the prevention of interference, and to regulate community antenna (CATV) systems.

Authorizations of AM radio stations increased in fiscal 1959 to 3,500, of which 3,377 were on the air. FM authorizations again showed a substantial

increase, totaling 934 stations, of which 776 were operating. The number of noncommercial educational FM stations increased from 157 to 165, of which 154 had authority to operate. During the year the commission ruled that daytime AM stations could not extend their hours of operation, but permitted local stations to increase their daytime power from 250 to 1,000 watts.

Safety and Special Radio Services.—Radio is employed for safety and navigational purposes by ships and aircraft, and is also used to expedite traffic, speed emergency medical service, contribute to police and fire protection, and increase industrial and commercial efficiency. In the 1959 fiscal year, FCC authorizations in nonbroadcast radio services increased to 511,907, which covered the use of about 1.7 million transmitters. As of June 30, 1958, authorized stations included: marine, 84,947; aviation, 77,682; public safety, 29,363; industrial, 49,697; land transportation, 59,894; amateur, 195,776; and miscellaneous, 14,548.

Field Engineering and Monitoring.—FCC field engineers, operating through 31 field offices and 18 monitoring stations, investigate about 24,000 interference complaints annually, and in fiscal 1959 uncovered 329 unlicensed radio operations, including 215 illegal TV boosters. The FCC monitoring network patrolled the radio spectrum, furnishing emergency bearings for ships and planes in distress. Another field operation is the processing of applications for high antennas involving aeronautical safety considerations.

Research.—Technical research activities of the FCC involve chiefly radio wave propagation, technical standards, and control of interference. The FCC laboratory at Laurel, Md., tests transmitters and devices before granting type-approval.

GEORGE O. GILLINGHAM,
Chief, Office of Reports and Information.

FEDERAL CROP INSURANCE. The 1959 operations of the Federal Crop Insurance Corporation were featured by a new experience record and development of a new plan of all-risk crop insurance which will provide farmers more choice in fitting the insurance to their needs.

For the first time in its history the corporation experienced a third consecutive year in which the premiums paid by farmers for its all-risk protection exceeded the indemnities paid to its policyholders. It required 71% of the 1959 premium income to pay indemnities, compared with 26% in 1958 and 69% in 1957.

The favorable 1959 insurance experience reflected another good crop production year nationally, although severe crop losses due to drought were suffered by farmers in many counties in the Dakotas and Minnesota. About 60% of the total indemnities paid in 1959 went to farmers in these three states. The loss was heaviest in South Dakota where the corporation paid over $4 million to farmers whose insured crops were destroyed or severely damaged. It required three times the premiums paid by South Dakota farmers to pay the losses in that state, while North Dakota collected sufficient premium within the state to cover the losses in those counties where crop failures were widespread. Minnesota had a 1.07 loss ratio.

The corporation's 1959 premium income exceeded $18.5 million, while the total indemnities paid will total between $12 million and $13 million when all claims are settled.

The new Guaranteed Production Plan developed by the corporation will be introduced into its 847 insurance counties during 1960 and 1961. Under this plan the corporation will guarantee the policyholder a minimum amount of good quality production. Any per cent that the policyholder falls below this guarantee will be his per cent of loss. The per cent of loss applied to the dollar amount of insurance he has selected from the choices available to him will give the amount of indemnity to be paid. This plan simplifies the all-risk insurance operation and at the same time offers farmers more choice than has been available to them previously.

In 1960 the all-risk insurance operations will include insurance on barley, dry edible beans, citrus, corn, cotton, flax, grain sorghums, oats, peaches, rice, rye, soybeans, tobacco and wheat. This insurance protection is against the unavoidable production risks beyond the control of the farmer, such as weather, insects, and plant disease. It is limited by legislation to a maximum of the cost of producing the insured crop in the area.

F. N. MCCARTNEY,
Manager, Federal Crop Insurance Corporation.

FEDERAL POWER COMMISSION. Originally established in 1920, and organized in its present form as an independent agency in 1930, the Federal Power Commission has jurisdiction conferred by the Federal Power and Natural Gas acts, and other statutes and executive orders. The commission has five members, appointed by the president with the advice and consent of the Senate. The membership of the commission as of Dec. 1, 1959, was: Jerome K. Kuykendall, chairman; William R. Connole, vice chairman; Frederick Stueck, Arthur Kline, and John B. Hussey.

Natural Gas.—The commission during the year ended June 30, 1959, issued 198 certificates authorizing 4,900 miles of natural gas pipeline and installation of 613,000 compressor horsepower estimated to cost $763,000,000. Authorizations since Feb. 7, 1942, when the certificate provisions of the Natural Gas Act became effective, included nearly 85,000 miles of pipeline and more than 6,000,000 compressor hp., estimated to cost approximately $7,200,000,000. In addition to the pipeline certificate activities, 1,803 certificate and abandonment applications were filed by independent natural gas producers, 1,216 were disposed of, and 2,507 were still pending on June 30, 1959.

Electric Power.—The commission during the fiscal year 1959 acted on 110 applications relating to hydroelectric projects, authorizing 2,430,736 hp. of new ultimate capacity. On June 30, 1959, there were 613 licenses outstanding for projects designed to provide a total ultimate installation of approximately 32,191,240 hp.

In December 1958, loads of major electric utilities reached a peak of 116.9 million kilowatts, a growth of about 5.7 per cent in 12 months. Generating capacity increased 13.5 million kw. during 1958 to a total of 142.6 million kw.

Rates.—During the 12-month period ending June 30, 1959, approximately 1,724 gas pipeline and electric interstate rate filings were made. They included reductions amounting to approximately $1,994,800 and proposed increases of $166,086,300 annually.

The FPC permitted $3,858,500 of the proposed increases to become effective, and the remainder—about $162,227,800—were suspended. On June 30, 1959, about $234,241,100 per year of the suspended gas increases were being collected subject to refund. At the beginning of the year there was a backlog of $211,513,500 which, when added to the suspensions during the year, made a total of $373,741,300 in suspended rates requiring commission action. Companies withdrew $5,578,200, and the commission allowed $23,131,900 and disallowed $9,968,000. At the close of the year, the commission's dockets included $335,033,200 of proposed

rate increases, under suspension, which were filed during or prior to the 1959 fiscal year.

Independent natural gas producers made 8,769 rate filings during the fiscal year, including 2,042 rate increases totaling $58,868,737 annually. A total of 1,091 of these increases, amounting to $51,903,269, were suspended; and 951, totaling $6,965,468, were allowed. During the fiscal year 6 increases, totaling $1,914,030, were remanded by court order.

At the beginning of the 1959 fiscal year there was a backlog of $59,577,735, making a total of $113,395,034 in suspended producer rates requiring action during the year. Of this amount, $196,053 was disallowed, $1,552,041 was permitted to become effective, and $1,023,874 was withdrawn. Including the carryovers, the suspensions in the fiscal year 1958, and the cases remanded by the courts, there was pending on June 30, 1959, a backlog of $110,623,066 in suspended independent producer rates.

JEROME K. KUYKENDALL,
Chairman, Federal Power Commission.

FEDERAL RESERVE SYSTEM. See BANKING.

FEDERAL TRADE COMMISSION. Functions.—This federal regulatory agency was organized in 1915 to safeguard free and fair business competition in the United States. It is empowered to issue cease and desist orders prohibiting illegal methods of competition in the sale of goods and services. Possessing the widest jurisdiction of any trade regulation body, it has the power to halt illegal acts and practices in their incipiency as well as after their effects have been demonstrated.

Essentially, the commission's purpose is to prevent rather than punish unlawful business competition. Its original orders provide no penalty or punishment; however, if they are violated, the commission can institute court proceedings through the Department of Justice and obtain penalties against order violators up to $5,000 per day per offense. In 1959 this authority was extended to cover FTC orders issued under the Clayton Act as well as the Federal Trade Commission Act.

FTC orders fall into two broad categories: those designed to stop deception of buyers; and those aimed at monopolistic practices, such as price-fixing conspiracies and corporate mergers whose effect is to eliminate competition.

In addition, the commission employs procedures whereby businesses are aided in stamping out illegal competition by voluntary means. Instead of bringing actions against individual offenders, the commission issues trade practice rules for an entire industry. These rules clarify the law's requirements as applied to the particular practices in that industry. Should an industry member thereafter violate the rules (and hence the law), the commission would bring action looking to the issuance of a cease and desist order. The year 1959 saw effective use by the FTC of a companion procedure of issuing industry guides to clarify the law's requirements concerning: (1) a particular area of difficulty within an industry, or (2) a deceptive practice common to many industries.

The commission also makes studies of the nation's economic problems in which possible trade restraints exist. During 1959 it was engaged in such a study of concentration in the food industry.

In addition to its broad authority to proceed against "unfair methods of competition" and "unfair and deceptive acts and practices," the FTC also is charged with policing special statutes calling for truthfulness in the labeling and advertising of furs, woolens, and textiles. Responsibility for the latter was added in 1959 with the passage by Congress of the Textile Products Identification Act, whose provisions go into effect March 3, 1960.

Current Actions.—Case work during 1959 continued at a high level. A slight decline in the number of complaints was more than offset by a sharp increase in orders issued—an all-time high of 331, including 267 prohibiting deceptive practices and 64 halting monopolistic practices.

The commission's growing concern with threatened competition in the food field resulted in complaints challenging the acquisition of nearly 2,400 stores by two of the nation's largest retail food chains. In addition, 35 investigations of suspected monopolistic practices, such as price-fixing, were under way in mid-1959. At the same time, two of the nation's leading dairy companies were confronted by FTC charges of fixing prices for milk and dairy products.

Increased emphasis was given in 1959 to enforcement of the Robinson-Patman Act's requirement that a supplier give proportionally equal advertising and promotional services to all competing customers. Among the firms whose practices were attacked was the nation's largest newsstand chain for favoring publishers and distributors of widely circulated magazines. Another was a large eastern jewelry firm which induced discriminatory allowances from manufacturers of watches, costume jewelry, and movie equipment.

Among other significant antimonopoly actions were FTC attacks on 15 automobile tire and tube manufacturers and two trade groups for conspiracy to fix prices in their $2 billion industry, and complaints against two leading oil companies for fixing and maintaining retail gasoline prices.

The greatest number of complaints and orders continued to be directed at deceptive practices, and the principal target was fictitious pricing of merchandise. In this field alone, 117 complaints and 88 orders were issued, involving more than 45 products ranging from cultured pearls to prefabricated houses. At the same time, the commission encouraged the Better Business Bureaus to make a coordinated effort to halt the same evil in intrastate commerce where the FTC lacked jurisdiction. The result was one of the most spectacularly effective attacks on a business evil in the FTC's history.

Of noteworthy significance in 1959 was the FTC's appeal to the automobile battery industry to stop misleading the public on the meaning of guarantees for batteries. As a result, 21 major sellers of batteries signed stipulations agreeing to stop the misleading advertising.

Directing the work of the commission's staff are five commissioners who serve seven-year staggered terms. They are: Earl W. Kintner, chairman, Robert T. Secrest, Sigurd Anderson, William C. Kern, and Edward T. Tait.

S. F. STOWE,
Director of Public Information, FTC.

FIJI. This largely self-governing British crown colony comprises 322 South Pacific islands (106 inhabited) lying 1,200 miles south of the equator and 1,100 miles north of New Zealand. Its aggregate area, including dependent Rotuma (18 square miles) is 7,040 square miles. At the 1956 census the population totaled 345,737, including 169,403 Indians, 148,134 Fijians, 6,402 Europeans, 7,810 part-Europeans, and 4,155 Chinese; it was estimated at 368,000 on July 1, 1958. The largest inhabited islands are Viti Levu (4,010 square miles), on which is Suva (the capital and chief seaport; pop. 36,967 in 1956), and Vanua Levu (2,137 square miles). About 72% of the total population lives on Viti Levu.

The governor of Fiji is Sir Kenneth P. Maddocks (appointed on Oct. 10, 1958). He is assisted by a 9-member Executive Council, including 1 Fijian and 1 Indian; and a 31-member Legislative Council, including 5 Indians and 5 Fijians. Fiji is administered in 14 *yasana* (provinces) and 76 *tikina* (districts) under a Provincial Council, the Fijians themselves having power to make bylaws, impose taxes, and administer justice in native courts. A Council of Chiefs advises the government on Fijian affairs.

Recurrent revenue for 1959 was estimated at £F6,728,764; expenditure, at £6,285,471 (£F111 = £100 sterling). Capital expenditure, including part of the cost of a new wharf at Lautoka, was estimated at £F2,943,312.

In 1959 schools numbered 557, including a teacher-training college and a medical school.

The mileage of proclaimed roads totals 948, of which 788 miles are usable in all weathers. Work was completed in 1959 to adapt Nandi (Nadi) International Airport to transpacific jet aircraft at a cost of nearly £F3 million. Internal services are operated by Fiji Airways, Ltd., and external services by Tasman Empire Airways, Qantas Empire Airways, and other major lines.

In 1958 a record output of sugar, the main agricultural crop, totaled 202,236 tons (1,531,304 tons of cane crushed, from 76,838 acres). Other leading products were copra (33,089 tons), bananas (184,603 cases), and cacao (introduced in 1956). Minerals included gold (86,794 fine ounces), silver (25,373 fine ounces), and manganese ore (18,295 tons). Light industry comprises copra milling, brewing, electroplating, button making from trochus shell, and the manufacture of tortoiseshell jewelry, clothing, cigarettes, precast concrete products, furniture, and curios.

Exports valued at £F14,045,398 in 1958 included raw sugar, £F7,252,431; coconut oil, £F2,249,114; gold, £F1,140,614; manganese ore, £F402,417; and bananas, £F163,192. Imports were valued at £F17,603,000.

FINANCIAL AND ECONOMIC REVIEW. Major financial and economic developments in the United States and Canada in 1959 are reviewed in separate articles on specific subjects. For a reference guide to these subjects, see the Index entry, *Financial and Economic Review*.

FINE ARTS. See ARCHITECTURE; DANCE; MUSIC; PAINTING AND SCULPTURE; THEATER.

FINLAND. A northern European republic bounded by Sweden, Norway, and the USSR, Finland has a total area of 130,119 square miles (9% inland water, 65% forests) and a population (est. Jan. 1, 1959) of 4,412,631, of which 37% is urban and 8.6% is Swedish speaking. The major cities are Helsinki (441,678), the capital, Tampere (122,000), Turku (120,000), and Lahti (63,000).

Government.—The chief executive is a president chosen by a popularly elected electoral college of 300 for a 6-year term; the incumbent is Urho K. Kekkonen, whose term expires on March 1, 1962. Presidential powers are substantial, especially in foreign relations. The unicameral Diet consists of 200 members chosen by universal suffrage for 4-year terms in direct and proportional elections. As of Oct. 1, 1959, party membership in the Diet was as follows: Finnish People's Democratic League (Communist controlled), 50; Agrarians, 47; Social Democrats, 37; National Coalition (Conservatives), 29; Swedish People's Party, 14; Social Democratic Opposition, 14; Finnish People's Party, 8; and Finnish Small Farmers, 1. An Agrarian minority government headed by Vieno J. Sukselainen came into power on Jan. 13, 1959 (see also below, *Principal Events, 1959*).

Education and Religion.—School attendance is compulsory between the ages of 7 and 16, and literacy is almost universal. A reorganization of the elementary system in 1958 established a 6-year primary school followed by a 2-year citizen school which stresses vocational subjects. As of 1957, there were 6,608 elementary schools with 25,212 teachers and 622,331 pupils. Postelementary education is offered at secondary vocational schools (320 in 1957) or at lyceums and middle schools (422 with 161,881 students in 1957). Higher and adult education takes three forms: universities and colleges (15 in 1959, including Helsinki University, the oldest, founded in 1640, and Oulu University, the newest, opened in 1959); people's high schools (83 in 1957); and workers' academies (91 in 1957). Most educational institutions qualify for government subsidies.

More than 93% of the Finns belong to the state-supported Evangelical Lutheran Church. The freedom of other faiths is guaranteed by the constitution.

Finance.—Government revenue in 1958 totaled 299,059 million markkaa (320 markkaa = U.S.$1), or 5% more than in 1957; expenditures, 292,666 million (4% over 1957), of which 11% was allocated to the maintenance of employment and 8% to agricultural subsidies. The national debt was 146,084 million markkaa, of which 78,996 million consisted of external debt. Budget proposals for 1960 called for expenditures of 334.7 billion markkaa, or 29.7 billion more than the 1958 budget and an all-time record.

Transportation and Communications.—Lakes, rivers, and canals provide 2,700 miles of navigable waterways, and there are 22,446 miles of highways and 18,723 miles of other public roads. In 1959, Finland had 3,220 miles of railroads, nearly all government owned; 753,007 gross tons of merchant shipping; and 203,900 motor vehicles, including 141,600 passenger cars. There were 524,600 telephones and 1,111,877 radios in 1957, and 16,126 television sets as of March 31, 1959. Two Finnish airlines, Aero Oy (Finnair) and Kar-Air, operated 21 commercial planes in 1958. As of Dec. 31, 1958, there were 112 daily newspapers, the largest being the independent *Helsingin Sanomat*, with a circulation of over 270,000.

Production.—While employing nearly 40% of the labor force, agriculture contributed only 11.7% to the national product in 1957. Finnish agriculture is characterized by the small size of the farms, the predominance of dairying and fodder production, and the pursuit of logging as a source of supplementary income. The output of major farm products (in thousands of metric tons) was as follows in 1958: wheat, 220; rye, 126; barley, 398; oats, 778; sown hay, 3,556; sugar beets, 250; potatoes, 1,438; butter, 74.5; and cheese, 22.5. In addition, 702 million eggs were produced. Production is rising, and surpluses of milk products, export subsidies, and cereal deficiencies are causing concern.

Industry accounted for 31.3% of the national product in 1957 and employed 21.2% of the labor force. The five largest industries in terms of the gross value of output are foodstuffs, paper, electricity, wood products, and textiles. Wood products, paper and pulp, ships, and machinery constitute the major industrial exports. The output of basic industrial products (in thousands of metric tons) was as follows in 1958: cement, 925; pig iron and ferroalloys, 101; copper, 31; and steel ingots and finished castings, 188. Consumption of electricity totaled 7,895 million kw.-hr. While the industrial production index (1953 = 100) declined from 134 in 1957 to 127 in 1958, the output of the woodworking industry increased by 10%. The net domestic product, at 941.3 billion markkaa, was 4% higher than in 1957; the index of the real national product (1938 = 100) was 160. The production index rose again in the first 6 months of 1959, to an average of 132. During the year a new copper-nickel mine, with an expected annual yield of 300,000 metric tons of ore (enough to make Finland self-sufficient in nickel), began operations at Kotalahti.

Foreign Trade.—Three factors influenced Finnish trade in 1958: reduced foreign demand, the 1957 devaluation of the markka, and the domestic recession. The volume index of imports (1954 = 100) declined from 123 in 1957 to 110 in 1958, and that of exports from 117 to 115. Imports were valued at 233,302 million markkaa and exports at 247,934 million in 1958, producing a favorable balance of 14,632 million, as compared with an unfavorable balance of 15,542 million in 1957. In the first 6 months of 1959, imports totaled 122,306 million, and exports 114,637 million. Gold and foreign currency reserves rose from 33.9 billion markkaa in 1957 to 55.4 billion in 1958, and stood at 62.6 billion on June 30, 1959.

The percentage distribution of imports was as follows in 1958: industrial raw materials, 47.6; other raw materials, 3.6; fuels and lubricants, 14.0; consumer goods, 13.9; and other finished goods, 20.9. That of exports was: wood products, 31.1; paper products, 46.5; metal products, 13.7; agricultural products, 4.3; and other goods, 4.4. Sterling area countries accounted for 25.6% of Finnish foreign trade in 1958; other members of the Organization for European Economic Cooperation, 36.6%; the Soviet bloc, 24.9%; the United States and Canada, 4.7%; Latin America, 4.5%; and other countries, 3.7%. The USSR furnished 18.0%

WIDE WORLD

Frightened doe bounds to safety in this dramatic photo of brush fire which swept across 250 acres of hilly land in the Santa Monica Mountains, near Ventura, Calif., in July.

of Finnish imports and took 17.3% of Finnish exports in 1958.

Principal Events, 1959.—The year opened with an unsolved governmental crisis provoked by the resignation on Dec. 4, 1958, of a coalition cabinet headed by Karl August Fagerholm, allegedly because of Soviet displeasure. On Jan. 13, 1959, Vieno J. Sukselainen formed an Agrarian minority government, and in a statement of policy singled out two serious problems: Finnish-Russian relations and mounting unemployment. Meeting in Leningrad on January 22–23, President Urho K. Kekkonen and Soviet Premier Nikita S. Khrushchev paved the way for the restoration of normal relations; a new ambassador, A. V. Zaharov, was appointed by Moscow on February 3, and a trade agreement for the year was signed on March 13. In June, Khrushchev cited Finnish-Soviet relations as a model for other Scandinavian countries. A new 5-year trade agreement for 1961–65 was signed by the two countries on October 22, and an agreement for 1960 on December 22.

Developments in European economic integration were closely followed in Finland. While disappointed in the failure of a purely Nordic plan to materialize, Premier Sukselainen indicated on July 11 his government's interest in the projected Outer Seven free trade area, but he stipulated that Finland could not accept any political obligations or supranational organs that might restrict its freedom of action in foreign affairs. On November 17 the Diet rejected (143–49) a Communist-sponsored proposal opposing Finland's participation in any economic bloc. Meanwhile, the government was exploring means by which Finland could participate in the arrangements planned by the European Free Trade Association (q.v.), established by the Outer Seven on November 20.

Unemployment, which reached a peak of nearly 100,000, or more than 7% of the labor force, in mid-March, declined to about 9,000 by July because of domestic and international economic recovery. The gross national product was expected to be about 3% higher than in 1958. Industrial expansion has been greatly aided by loans from the United States and the International Bank for Reconstruction and Development. A $37 million pulp and paper loan on March 16, 1959, brought total IBRD loans since 1949 to $102 million.

Domestic politics were lively, with such issues as reform of presidential elections and need for a coalition cabinet under debate. The leading cultural event of 1959 was the 9th Sibelius Festival.

JOHN I. KOLEHMAINEN,
Chairman, Department of Political Science, Heidelberg College, Tiffin, Ohio.

FIRES AND FIRE LOSSES. According to preliminary estimates of the National Fire Protection Association (NFPA), there were approximately 11,300 deaths and $1,275,000,000 loss from fires of all types in the United States during 1959. The final 1958 loss record completed by the NFPA indicates that approximately 1,993,600 fires caused the death of 11,500 persons and a loss of $1,278,808,000, as compared with 11,300 deaths and $1,279,926,000 in fire losses in 1957.

The notable change in the 1958 fire statistics was an $11,807,000 decrease in building fire losses, partially accounted for by a $56,768,000 decrease in manufacturing losses and an $18,962,000 decrease in mercantile losses. These decreases more than offset increases of $32,750,000 in dwelling losses and of $17,995,000 in losses of office and bank buildings. Fire damage to buildings and their contents was valued by the NFPA at $1,056,308,000 in 1958, $1,068,115,000 in 1957, and $1,016,000,000 in 1956.

The accompanying table shows the number of large-loss fires and the dollar losses involved. These 356 fires, comprising only 0.02% of the total number of fires, caused over 22% of the 1958 fire loss.

CLASSIFICATION OF LARGE-LOSS FIRES, 1958
(Individual loss of $250,000 or more)

Classification	Number	Dollar loss
Manufacturing	85	$ 52,260,000
Mercantile	81	37,167,000
Aircraft	50	129,550,000
Storage and warehousing	43	21,134,000
Schools	17	6,568,000
Residential	10	3,538,500
Forest fires	9	7,781,500
Piers and wharves	6	3,006,000
Amusement places	6	3,130,000
Clubs, night, city, and country	6	2,132,500
Lumberyards	5	1,677,000
Churches	4	1,166,000
Bowling alleys	4	1,919,000
Gas wells, pipelines, and related storage facilities	3	2,106,500
Marinas	3	1,202,000
Railroad rolling stock	3	2,250,000
Buildings under construction	2	572,000
Hangars	2	2,035,000
Office buildings	2	674,000
Public buildings	2	900,000
Roundhouses	2	1,181,000
Ships	2	1,992,000
Miscellaneous	9	4,749,000
Total	356	$288,691,000

According to the NFPA's Fire Record Department, there were approximately 866,700 building fires in the United States in 1958. Some 558,000 of these fires were in dwellings. The remaining 1,126,875 fires in other than buildings involved aircraft (175), motor vehicles (173,000), forests (97,900), rubbish, grass, and brush (810,000), and miscellaneous categories (45,800). These estimates indicate that there were 11.6 fires per 1,000 population, or one fire for every 86 persons. Similarly, there were 5.0 building fires per 1,000 persons, or one such fire for every 200 persons.

Children rank first (approximately 10 deaths per day) on the list of fire victims. More people (over 5,000 in 1958) die from fires in homes than

in any other type of building. Being trapped in a building contributed to the death of an estimated 84% of home fire victims.

HENRY G. THOMAS,
President, National Fire Protection Association.

FISH. See FISH AND WILDLIFE SERVICE; FISHERIES INDUSTRY; and the Index entry, *Fish.*

FISH AND WILDLIFE SERVICE, U.S. The year 1959 was highlighted by unusually satisfying achievements, with particular emphasis on legislation.

Legislation.—The Fish and Wildlife Coordination Act was revised and expanded to give greater recognition to fish and wildlife resources in the planning and execution of federal projects in which fish and wildlife are affected. Steps are being taken to implement the intent of the amended act in cooperation with other federal agencies.

Important amendments to the Migratory Bird Hunting Stamp Act raised the price of the stamp from $2 to $3, effective July 1, 1959, and authorized that all receipts from sale of the stamps, less costs of printing and distribution, be spent to acquire lands for waterfowl, effective July 1, 1960.

The Alaska Statehood Act and subsequent events provide for ending more than 50 years of federal management of Alaska's fish and wildlife resources. On Jan. 1, 1960, Alaska assumed complete responsibility for its sport fish and game resources and for the commercially important salmon fishery. The federal government will continue its research on salmon and other fish and game.

Wildlife Refuges.—The refuge system was enlarged by the purchase of 28,361 acres of land in 112 separate ownerships, and the reservation of 46,713 acres of land by executive and public land orders. Additions included the 4,400-acre Pixley Refuge in Tulare County, California, and the 7,700-acre Buffalo Lakes Refuge in Randall County, Texas—the result of two Department of Agriculture land transfers. In Alaska the Simeonof National Wildlife Refuge of 10,442 acres of land and water was established by the withdrawal of public land for the preservation of sea otter and other species of wildlife. The Migratory Bird Conservation Commission approved the purchase of two new refuges—the Mackay Island National Wildlife Refuge of 7,856 acres in North Carolina and Virginia, and the Modoc National Wildlife Refuge of 6,049 acres in northeastern California. The commission also approved the acquisition of 11,300 additional acres for 8 existing refuges.

In 1958 there were more than 9 million visitor-days of public use on the 270 national wildlife refuges. The recreational use of these areas has increased nearly 170% between 1951 and 1958. Visitor-days increased from 3.4 million to 9.1 million in this eight-year period.

Fish Hatcheries.—Congress provided funds to continue construction of new hatcheries at Garrison Dam, N.Dak., Gavins Point Dam, S.Dak., and Pisgah National Forest, N.C. Funds were available to start a new trout hatchery at Willow Beach, Ariz. A determined, planned effort is being made to explore the ground water potential at fish-cultural stations to supplement diminishing surface water supplies. As a result, additional water of good quality and temperature has been provided at a number of hatcheries. Production and distribution of trout and salmon from federal hatcheries increased 13% by weight above any previous year.

Exotic Bird Introductions.—Important progress is being made in the cooperative foreign game bird introduction program. Studies were made in western Europe, Japan, India, and Afghanistan. Introductions included Reeves pheasants, Japanese green pheasants, red-legged partridges, bamboo partridges, gray francolins, and black francolins. Distribution is made on the basis of recommendations by the Exotic Game Committee of the International Association of Game, Fish, and Conservation Commissioners, and the Fish and Wildlife Service.

Fishery Management.—Technical assistance in the management of the many fine sport fishing waters under federal ownership or control, either separately or in cooperation with the states, was provided to 225 areas in the fiscal year 1959. At least one million man-days of fishing can be credited to the assistance given such areas.

Insecticides and Pesticides.—As directed by Congress in Public Law 85–582, research was intensified on wildlife-pesticide relationships. Laboratory tests were continued on physiological effects of minute dosages of many insecticides, and field studies were carried on to determine the effects of control programs on the fire ant in the South, the Dutch elm disease in the North, and on grasshoppers in the Western states. Field studies disclosed heavy wildlife losses from the fire ant control program. Robins are most vulnerable in Dutch elm disease control.

Licenses.—Nearly a million more fishing licenses were sold in the United States in the fiscal year 1958 than in the previous year, but hunting licenses showed a decline of 154,000. The combined total of 34,941,729 licenses (20,177,605 fishing and 14,764,124 hunting licenses) sold to sportsmen exceeded all previous records and was an increase of 746,546 over the 1957 record of 34,195,183. The cost to hunters and anglers for all licenses, permits, tags, and stamps (excluding the federal duck stamp) was $99,018,130, an increase of $8,401,091 over 1957. Hunting licenses cost $53,607,668; fishing licenses, $45,410,462.

EDNA N. SATER,
Chief Editorial Services, Office of Information, U.S. Fish and Wildlife Service.

FISHERIES INDUSTRY. Landings.—Fisheries landings in the United States in 1958 were 1% less than in 1957, due to decreased catches of industrial fish. The catch in 1959, however, showed a large increase and was expected to be second only to the record catch of 1956. Monthly wholesale prices from April through October 1959 were lower than in the same period of 1958. In October 1959 the U.S. Bureau of Labor Statistics wholesale index for fish and shellfish was 121.1, or 8.5 points lower than a year earlier. Production of halibut, Alaska herring, jack and Pacific mackerel, menhaden, shrimp, and whiting increased in 1959. Sharp declines occurred in the landings of anchovies, haddock, Maine herring, ocean perch, salmon, and Pacific sardines. Demand for most fishery products was good during 1959, and marketing problems were less acute than they had been for a number of years.

The catch of fish and shellfish in the United States and Alaska totaled about 4.7 billion pounds in 1958. This total compared with nearly 4.8 billion pounds in 1957, and an anticipated 5.1 billion pounds in 1959. From 26% of this catch, together with 233 million pounds of imported herring, salmon, and tuna, packers produced 1,099 million pounds of canned products, worth $388,582,000. About 40% of the catch, together with processing waste and about 12 million pounds of imported herring, yielded byproducts and bait worth $80 million; 32% was used fresh or frozen; and 2% was cured.

Some 131,000 fishermen and transporters, op-

erating over 76,000 vessels and boats, made average catches of 36,700 pounds each in 1958. Fishermen received $370 million for the 1958 catch, almost $20 million more than in 1957. Processing of the catch (by 98,000 shore workers in 4,402 plants) and distributing it to the ultimate consumer increased the value to $1,150 million. In addition, imported fishery products, valued at $552 million were sold to consumers.

In 1958, for the 13th consecutive year, the menhaden fishery produced the industry's largest landings, a total of 772,300 tons. However, the catch was 276,000 tons below the record 1956 production. The 1959 catch was expected to be over 1 million tons.

The Pacific sardine catch, which had averaged over 500,000 tons annually from 1934 to 1945, totaled only 103,700 tons in 1958, but this amount was more than four times the 1957 production. The 1959 catch was expected to total only 30,000 to 40,000 tons. The canned Pacific sardine pack totaled 2.2 million cases in 1958, an increase of almost 350% over the 1957 pack, but the 1959 pack was expected to be less than 750,000 cases. The canned Maine sardine pack of 2,100,000 cases in 1958 was 5% less than the 1957 total, and the 1959 pack was expected to be about 10% smaller. The 1958 canned salmon pack totaled 3,732,000 cases, or 16% more than in 1957. The 1959 Alaska canned salmon pack of 1,770,000 cases was the smallest in nearly 60 years.

The 1958 canned tuna pack of 14,094,000 cases, including the output of Hawaii, American Samoa, and Puerto Rico, was much greater than in 1957, and established a new record. The 1959 pack was slightly smaller.

The canned anchovy pack in California declined sharply to 54,000 cases in 1958, 88% less than in 1957. A further sharp decline occurred in 1959.

Menhaden, herring, "trash" fish, and processing waste were utilized in 1958 to produce 248,000 tons of fish meal (valued at $31,780,000); 22,028,000 gallons of marine-animal oil ($12,333,000); and fish solubles ($11,519,000). Shell products were valued at $11,361,000. Production of fish meal, oil, and solubles in 1959 was much greater than in 1958 because of sharply increased catches of menhaden and Alaska herring.

Fresh fish landings in 1958 at Boston, Gloucester, New Bedford, and on Cape Cod, Mass., amounted to 516,387,000 pounds, valued at $37.2 million, a decline of 5% in volume but an increase of 9% in value from 1957 levels. San Pedro, Calif., led all ports in 1958 with landings of 190,000 tons, mainly tuna, Pacific sardines, and mackerel. Lewes, Del., received 135,000 tons, mainly menhaden; Reedville, Va., 125,000 tons, mainly menhaden; Gloucester, Mass., 115,000 tons, mostly ocean perch, whiting, and menhaden; Beaufort-Morehead City, N.C., 94,000 tons, mostly menhaden, croaker, and gray sea trout; Boston, Mass., 61,900 tons, mostly haddock, cod, and pollock; San Diego, Calif., 61,000 tons, mostly tuna; New Bedford, Mass., 55,800 tons, mostly flounders, scallops, haddock, and industrial fish; and Portland, Me., 31,200 tons, mostly ocean perch, herring, whiting, lobsters, and pollock.

Fur Seal Skins.—A total of 57,810 skins were taken in 1959 from the federally supervised fur seal herd on Alaska's Pribilof Islands in the Bering Sea. Dressed and dyed skins sold at public auction in St. Louis, Mo., averaged $103.23 in the fall of 1959, compared with $99.75 in the spring.

Whales.—A total of 261 whales was taken in 1958 by catcher boats operated from the two whaling stations located on San Francisco Bay. The whales were used for the production of whale and sperm oil, meal, and frozen animal food.

Frozen Fish.—On Nov. 1, 1959, frozen fish holdings in the United States totaled 239 million pounds, compared with 211 million pounds a year earlier. Freezings of 300 million pounds during the first 10 months of 1959 were about 6% more than those for the same period in 1958. Fillets (mainly ocean perch and haddock), shrimp, whiting, halibut, salmon, and bait and animal food made up the bulk of the freezings in 1959. Stocks of fillet blocks, cod and haddock fillets, and shrimp were considerably larger than in 1958, while those of salmon and whiting were much lower.

Foreign Trade.—Foreign trade in fishery products amounted to $358,175,000 in 1958, up 7% from 1957 levels. Imports increased by 10% to $327,171,000 and exports by 14% to $31,000,000. Imported edible products amounted to 991,471,000 pounds, valued at a record $280,212,000. Principal increases in imports in 1958 consisted of frozen tuna, salmon, shrimp, and canned salmon and sardines. Imported nonedible products, consisting principally of fish and whale oils, fish scrap and meal, cultivated pearls, and aquatic leathers, increased 1% to a value of nearly $47,000,000.

Edible products exported in 1958 decreased to 65,468,000 pounds, valued at $19,440,000, a decrease of 23% in volume and 5% in value as compared with the previous year. Exported nonedible products were valued at $11,564,000. Imports of shrimp during the first 9 months of 1959 totaled 70,335,000 pounds, 33% more than for the same period in 1958. Imports of fish meal during the first three quarters of 1959 amounted to 119,923 tons, 50% more than in the same period in 1958 and nearly 20% more than was imported in all of 1958.

FLEMMING, Arthur Sherwood, American public official: b. Kingston, N.Y., June 12, 1905. Taking office on Aug. 1, 1958, as secretary of health, education, and welfare, Flemming came from a long background of federal service.

Educated at Ohio Wesleyan University (B.A., 1927), American University (M.A., 1928), and George Washington University (LL.B., 1933), Flemming became director of the American University's School of Public Affairs in 1934, and was promoted to executive officer of the university in 1938. As one of three members of the U.S. Civil Service Commission from 1939 to 1948 he proved an able administrator in the field of personnel. During World War II he also served with the Office of Production Management (1941–42), the War Manpower Commission (1942–45), and the Navy Department's Manpower Survey Board (1943–44), and thereafter (1947–49, 1953–55) was a member of the so-called Hoover Commission on government organization.

Named president of Ohio Wesleyan University in 1948, he was granted a leave of absence in 1951 to become assistant to the director of the Office of Defense Mobilization. Later he served as its director (1953–57) and as chairman of the Defense Mobilization Board. He resumed the presidency of Ohio Wesleyan in 1957, until joining the Eisenhower cabinet.

In 1959, Secretary Flemming strongly backed two unsuccessful administration measures for federal aid for school and college construction. He told a news conference on June 4 that he opposed any such bill that did not treat federal aid to education as a temporary expedient, that did not require the states to match federal funds, and that did not take into account the overall fiscal situation. He fought a measure in Congress that would have brought health insurance for the aged under the Social Security System, although in December he admitted a need for federal action in the field of medical care for the aged.

In a late-year announcement (December 23),

Flemming reiterated his support for federal aid to school construction and, in connection with the National Defense Education Act of 1958, recommended a supplemental appropriation under its provisions for the student loan program and requested Congress to repeal the loyalty oath requirement from that program.

Shortly before Thanksgiving, Flemming made headlines by publicly announcing that some of the 1958 and 1959 cranberry crop had been contaminated with aminotriazole, a weed killer which he implied might produce cancer in humans if taken in large enough quantities. On December 10 the secretary announced a halt in the production and sale of chickens which had been treated with stilbestrol, an artificial hormone used to fatten poultry and beef cattle. As in the case of the cranberries, there was the implication that the chemical might produce cancer.

FLEXNER, Abraham (92), American educator: b. Louisville, Ky., Nov. 13, 1866; d. Falls Church, Va., Sept. 21, 1959. In a lifetime devoted to the improvement of higher education in the United States and Europe, he helped bring about much-needed reforms, particularly in the field of medical education.

The son of immigrants from Bohemia, Flexner attended Johns Hopkins (B.A., 1886). After graduation he taught in a Louisville high school and in 1891 founded his own preparatory school. Here his radical teaching methods brought great success and attracted wide attention. Following further study at Harvard (M.A., 1906), he attended the University of Berlin for a year and then wrote *The American College: A Criticism* (1908). Through this book he was introduced to the Carnegie Foundation for the Advancement of Teaching, which commissioned him to make an investigation of medical schools in the United States, the first education survey of note ever taken. Flexner's findings chastised the operation of all but 31 of the 155 medical colleges which he visited in the United States, as well as in Canada, and his report, *Medical Education in the United States and Canada* (1910), brought prompt and dramatic results. Nearly half the schools which he cited were forced to close, and the rest instituted reforms in standards and organization. His single report is credited with elevating the general status of American medical teaching.

In 1913 Flexner began a 15-year association as an executive with the General Education Board of the Rockefeller Foundation. In this capacity he was able to raise vast sums of money to use in improving academic standards in colleges and universities. From John D. Rockefeller, Sr., alone he was able to obtain nearly $50 million for medical education, and from other noted philanthropists he succeeded, on behalf of the General Education Board, in securing an additional half-billion dollars.

Flexner's idea of the university was that it should devote itself entirely to a classical curriculum; he had no patience with nonacademic courses and degrees, which he believed to be outside the proper realm of the university. In 1930 he moved toward fulfillment of this ideal by founding the Institute for Advanced Study at Princeton, N.J., through a contribution of $8 million by Louis Bamberger and his sister, Mrs. Felix Fuld. Flexner became its first director, serving until 1939, and induced Albert Einstein to leave Germany to become the institute's first professor.

The author of a number of books and pamphlets on education, Flexner wrote *Medical Education in Europe* (1912); *A Modern School* (1916), which led to the creation of the Lincoln Experimental School of Columbia University's Teachers College; and *Universities—American, English, German* (1930), based on the Rhodes Trust Memorial Lectures which he delivered at Oxford two years earlier. His autobiography, *I Remember*, appeared in 1940.

FLIGHT RECORDS. Unofficial Records.—Major flight records set in 1959 (aside from the official records listed below) include the following:

Maximum speed over a straightaway course: *World record*, 1,520 mph.—Maj. Joseph W. Rogers, USAF, with F-106 Delta Dart; Edwards AFB, Calif., Dec. 15, 1959.

Altitude: *World record*, 103,395.5 feet—Capt. Joe B. Jordan, USAF, with F-104C Starfighter; Edwards AFB, Calif., Dec. 14, 1959.

Maximum speed over a closed course: *World record*, 1,216.48 mph.—Brig. Gen. Joseph H. Moore, USAF, with F-105 Thunderchief; Edwards AFB, Calif., Dec. 11, 1959.

Rotorplane altitude record: *World "class" record for craft weighing between 1,750 kilograms and 3,000 kilograms (2,204.6 to 3,858 pounds)*, 29,770 feet—Capt. Walter J. Hodgson and Maj. William J. Davis, USAF, with Kaman H-43 Baker helicopter; Bloomfield, Conn., Dec. 9, 1959.

Official Records, 1958–59.—Flight records set after Aug. 1, 1958, and officially recognized by the Fédération Aéronautique Internationale by Dec. 1, 1959, include the following major records:

JET-POWERED AIRPLANES

Maximum speed over a closed circuit: *World record*, 1,771 km. per hr. (1,100.426 mph.)—Gerard Muselli (France) with Mirage III-A No. 03 monoplane; June 18, 1959.

Distance in a closed circuit without refueling: *World "class" record*, 10,032.64 km. (6,233.981 miles)—Lt. Col. Victor L. Sandacz, USAF, with Boeing B-52D monoplane; Ellsworth, S. Dak.-Newberg, Oreg.-Douglas, Ariz.-Ellsworth, Sept. 26, 1958.

Altitude without payload: *World "class" record*, 28,852 meters (94,635 feet)—Vladimir Iljiuchin (USSR) with T-431 monoplane; July 14, 1959.

Speed for 100 kilometers (62.137 miles) in a closed circuit without payload: *World "class" record*, 1,771 km. per hr. (1,100.426 mph.)—Gerard Muselli (see above).

Speed for 500 kilometers in a closed circuit without payload: *World "class" record*, 1,313.677 km. per hr. (816.3 mph.)—Capt. George A. Edwards, Jr., USAF, with McDonnell RF-101C; Edwards AFB, Calif., April 15, 1959.

Speed for 1,000 kilometers in a closed circuit without payload: *World "class" record*, 1,126.6195 km. per hr. (700.047 mph.)—Col. E. H. Taylor, USAF, with McDonnell RF-101C; Edwards AFB-San Francisco-Oakland-Edwards, April 8, 1959.

Speed for 2,000 kilometers (1,242.739 miles) without payload: *World "class" record*, 948.354 km. per hr. (589.279 mph.)—Capt. Charles E. Gibbs, USAF, with Boeing KC-135 Stratotanker; Spokane-Hoquiam-Spokane, Wash., Sept. 17, 1958.

Speed for 5,000 kilometers (3,106.849 miles) without payload: *World "class" record*, 961.867 km. per hr. (597.675 mph.)—Capt. Cholett Griswold, USAF, with Boeing B-52D monoplane; Ellsworth, S. Dak.-Houston, Texas-Waterville, Ohio-Ellsworth, Sept. 26, 1958.

Speed for 10,000 kilometers (6.213.698 miles) without payload: *World "class" record*, 902.369 km. per hr. (560.705 mph.)—Lt. Col. Victor L. Sandacz, USAF, with Boeing B-52D monoplane; Ellsworth, S. Dak.-Newberg, Oreg.-Douglas, Ariz.-Ellsworth, Sept. 26, 1958.

Altitude with payload of 1,000 kilograms (2204.622 pounds): *World "class" record*, 20,456 meters (67,096 feet)—Vladimir Smirnov (USSR) with monoplane Type RV; July 13, 1959.

Speed for 2,000 kilometers (1,242.739 miles) with payload of 1,000 kilograms: *World "class" record*, 948.354 km. per hr. (589.279 mph.)—Capt. Charles E. Gibbs (see above).

Speed for 5,000 kilometers (3,106.849 miles) with payload of 1,000 kilograms: *World "class" record*, 944.907 km. per hr. (587.138 mph.)—Capt. Charles E. Gibbs (see above).

Altitude with payload of 2,000 kilograms (4409.2 pounds): *World "class"* record, 20,174 meters (66,170.72 feet)—Vladimir Smirnov (USSR) with RV monoplane; July 29, 1959.

Speed for 2,000 kilometers (1,242.739 miles) with payload of 2,000 kilograms: *World "class" record*, 948.354 km. per hr. (589.279 mph.)—Capt. Charles E. Gibbs (see above).

Speed for 5,000 kilometers 3,106.849 miles) with payload of 2,000 kilograms: *World "class" record*, 944.907 km. per hr. (587.136 mph.)—Capt. Charles E. Gibbs (see above).

Speed for 2,000 kilometers with payload of 5,000 kilograms (11,023 pounds): *World "class" record*, 948.354 km. per hr. (589.279 mph.)—Capt. Charles E. Gibbs (see above).

Speed for 5,000 kilometers with payload of 5,000 kilograms: *World "class" record,* 944.907 km. per hr. (587.136 mph.)—Capt. Charles E. Gibbs (see above).

Speed for 2,000 kilometers with payload of 10,000 kilograms (22,046 pounds): *World "class" record,* 948.354 km. per hr. (589.279 mph.)—Capt. Charles E. Gibbs (see above).

Speed for 5,000 kilometers with payload of 10,000 kilograms: *World "class" record,* 944.907 km. per hr. (587.136 mph.)—Capt. Charles E. Gibbs (see above).

Greatest payload carried to an altitude of 2,000 meters (6,561.666 feet): *World "class" record,* 35,421 kilograms (78,089.5 pounds)—Capt. William H. Howell, USAF, with Boeing KC-135A Stratotanker; Westover AFB, Mass., Sept. 24, 1958.

Propeller-Driven Airplanes

Altitude with payload of 10,000 kilograms (22,046 pounds): *World "class" record,* 13,154 meters (43,156 feet)—Vladimir Kokkinski (USSR) with IL-18; Nov. 15, 1958.

Altitude with payload of 15,000 kilograms (33,069 pounds): *World "class" record,* 12,471 meters (40,915 feet)—Vladimir Kokkinski (USSR) with IL-18; Nov. 14, 1958.

Greatest payload carried to an altitude of 2,000 meters (6,561.666 feet): *World "class" record,* 53,478.5 kilograms (117,900 pounds)—Lt. Col. John K. Thompson and Capt. Rayvon Burleson, USAF, with Douglas C-133A Cargomaster; Dover, Del., Dec. 16, 1958.

Light Airplanes, 1,750 to 3,000 Kilograms (3,858.1 to 6,613.9 Pounds)

Airline distance: *World "class" record,* 12,341.26 kilometers (7,668.48 miles)—Max Conrad (United States) with Piper Comanche 250; Casablanca-Los Angeles, June 2–4, 1959.

Speed for 2,000 kilometers (1,242.739 miles) in a closed circuit: *World "class" record,* 364.116 km. per hr. (226.972 mph.)—Miss Jerrie Cobb (United States) with Aero Commander 680-E; Las Vegas, Nev., April 13, 1959.

Rotorplanes

Altitude with payload of 5,000 kilograms (11,023 pounds): *World "class E" record,* 5,584 meters (18,916 feet)—Sergyei Bvovtsev (USSR) with MI-6 helicopter; April 16, 1959.

Altitude with payload of 10,000 kilograms (22,046.22 pounds): *World "class E" record,* 4,885 meters (16,023 feet)—Rafail Kaprelian (USSR) with MI-6 helicopter; April 16, 1959.

Speed for 100 kilometers over a closed circuit: *World "class E-2" record,* 307.22 km. per hr. (190.897 mph.)—Sqd. Ldr. Wilfred R. Gellatly (New Zealand) with Rotodyne XES-21; Jan. 5, 1959.

Light Rotorplanes, 1,000 to 1,750 Kilograms (2,204.6 to 3,858 Pounds)

Speed for 500 kilometers (310.685 miles) in a closed circuit: *World "class" record,* 170.445 km. per hr. (105.91 mph.)—Vsevolod Vinitsky (USSR) with KA-15 helicopter; May 6, 1959.

Light Rotorplanes, 1,750 to 3,000 Kilograms (3,858 to 6,613.9 Pounds)

Altitude without payload: *World "class" record,* 6,700 meters (21,982 feet)—Fiodor Belouchkin (USSR) with MI-1 helicopter; March 12, 1959.

Speed for 100 kilometers (62.137 miles) in a closed circuit: *World "class" record,* 210.535 km. per hr. (130.82 mph.)—Vsevolod Vinitsky (USSR) with MI-1 helicopter; May 21, 1959.

Speed for 599 kilometers (310.685 miles) in a closed circuit: *World "class" record,* 196.452 km. per hr. (122.069 mph.)—Vsevolod Vinitsky (USSR) with MI-1 helicopter; May 19, 1959.

Gliders, Multiplace

Distance to a predetermined point with return to point of departure: *World "class" record,* 484.4 kilometers (303.48 miles)—Zbigniew Kirakowski (Poland) with Bocian SP-1921 sailplane; May 12, 1959.

Speed for 100 kilometers over a triangular course: *World "class" record,* 87.511 km. per hr. (54.377 mph.)—Harland C. Ross (United States) with Ross R-6 sailplane; starting and finishing point, Odessa, Texas, August 14, 1958.

Speed for 200 kilometers over a triangular course: *World "class" record,* 81.349 km. per hr. (50.548 mph.)—Harland C. Ross (United States) with Ross R-6 sailplane; Odessa, Texas-Wink, Texas-Eunice, N. Mex.-Odessa, Aug. 12, 1958.

Speed for 300 kilometers over a triangular course: *World "class" record,* 82.349 km. per hr. (51.169 mph.)—Harland C. Ross (United States) with Ross R-6 sailplane; Odessa, Texas-Eunice, N. Mex.-Lamesa, Texas-Odessa, Aug. 13, 1958.

Feminine Records

Rotorplanes—Altitude: *World "class" record,* Mme. Tatiana Roussian (USSR) with MI-1 helicopter; March 27, 1959.

Gliders, single-place—Distance to a predetermined point with return to point of departure: *World "class" record,* 368 kilometers (228.66 miles)—Pelagia Majewska, (Poland) with Jaskolka SP-1421 sailplane; June 20, 1959.

Gliders, multiplace—Distance in a straight line: *World "class" record,* 518.59 kilometers (322.236 miles)—Pelagia Majewska (Poland) with Bocian SP-1552 sailplane; Aug. 10, 1958.

Gliders, multiplace—Speed for at least 100 kilometers over a triangular course: *World "class" record,* 85.42 km. per hr. (53.077 mph.)—Mme. Cvetka Klancnik-Belin (Yugoslavia) with Kosava YU-5022 sailplane; Sept. 8, 1958.

Gliders, multiplace—Speed over a triangular course of 300 kilometers (186.41 miles): *World "class" record,* 61.717 km. per hr. (38.35 mph.)—Mme. Lucyna Bajewska (Poland) with Bocian SP-1928 sailplane; May 9, 1959.

FLOOD CONTROL. Serious flooding hit Indiana, Ohio, Pennsylvania, and New York in January 1959. Following these disasters, the U.S. Corps of Engineers issued a comprehensive statement on the nation's present capacity to protect itself against flood damage. The Corps of Engineers, which has primary responsibility at the federal level for flood control, estimated that damages from floods now cost about $700 million a year in the United States. The report stated that it would not be economical to try to forestall about a third of this damage; but the other two thirds of all present flood damage could be prevented at costs lower than the cost of the losses themselves. The $5.2 billion allocated to projects now either under construction or authorized for construction would cut the nation's present annual flood damage bill by one third; another $8 billion spent on projects not yet authorized might cut another third from the $700 million annual damage total, according to the Corps of Engineers.

However, even if the authorized flood control projects were completed, it is possible that the annual cost of flood damage might go up instead of down. This would be the case if, for example, builders were left free to construct buildings in the flood plains of rivers. Flood damage can be greatly reduced by proper zoning of the flood plains; but thus far, only Connecticut has done much in the way of zoning to prevent flood-damaged structures from being rebuilt where they can be damaged again. A recent study of urban areas across the country shows a net increase, rather than a decrease, in the number of structures in flood plains since flood control became a federal responsibility in 1936.

The first appropriation of funds for flood control by Congress was $81 million in 1938. This figure has risen to about $300 million a year. Meanwhile, the federally supported flood insurance that was foreseen in a Federal Flood Insurance Act of 1956 has not yet materialized.

In the spring of 1959 the Tennessee Valley Authority, which has an effective harness on the Tennessee River and its tributaries, reported on a six-year experiment in zoning. TVA has cooperated with communities in its area by providing the information for flood plain planning, and six of the cities have adopted zoning.

An interstate compact to prevent floods on streams in the Brandywine Valley was concluded by Pennsylvania and Delaware. Wilmington, Del., is the principal city in the river basin. The plan is to create several river-control structures in the valley.

More disastrous floods occurred in the fall of 1959. In the Southwestern states of Texas, Oklahoma, and Arkansas flood damage amounted to approximately $47 million, but the Corps of Engineers estimated that a further $80 million of damage was prevented by existing flood-control structures.

Among the worst floods of the year was a del-

uge that broke a masonry dam on the Tera River in northwestern Spain in January, destroying a village and drowning about 325 persons. The dam was a power dam only two years old. Rain had filled its reservoir for the first time, and the dam reportedly failed as its spillway was overtopped.

On Dec. 2, 1959, the Malpasset Dam on the French Riviera gave way, the ensuing flood leaving at least 421 dead and 82 missing near the town of Fréjus in the Reyran River valley. The dam, built of reinforced concrete, was the thinnest in the world when it was completed in 1954. It broke after several days of heavy rains had built up the pressure of the water behind it.

FLOODS. See FLOOD CONTROL and the Index entry, *Floods.*

FLORIDA. South Atlantic state, United States; admitted to the Union, March 3, 1845. The "Everglade State" ranks 22d in area and 11th in population among the 50 states.

Area and Population.—Area: 58,560 square miles (land, 54,262; inland water, 4,298), divided into 67 counties. Population: (1950) 2,771,305; (est., July 1, 1958) 4,515,000. Urban places with 1950 populations above 10,000 (unless another date is given):

Bradenton	13,604	Miami Beach	50,981[2]
Brownsville—Brent Goulding[1]	20,269	Miami Springs town	10,138[2]
Clearwater	15,581	North Miami	23,463[2]
Coral Gables	29,210[2]	North Miami Beach	12,161[2]
Daytona Beach	30,187	Ocala	11,741
Fort Lauderdale	62,906[2]	Orlando	52,367
Fort Myers	13,195	Panama City	32,097[3]
Fort Pierce	13,502	Pensacola	50,954[4]
Gainesville	26,861	St. Augustine	13,555
Hialeah	43,135[2]	St. Petersburg	96,738
Hollywood	22,798[2]	Sanford	11,935
Jacksonville	204,517	Sarasota	18,896
Key West	26,433	Tallahassee[5]	38,100[2]
Lake Worth	15,315[2]	Tampa	124,681[6]
Lakeland	30,851	Warrington[1]	13,570
Miami	259,035[2]	West Palm Beach	51,015[2]

[1] Unincorporated. [2] Special census, 1955. [3] Special census, 1957. [4] Special census, 1956. [5] Capital. [6] Not including annexations which, in a special census of Jan. 21, 1954, totaled 92,100.

Executive.—Chief state officers in 1959:
Governor: LeRoy Collins (Democrat)
Secretary of State: R. A. Gray
Treasurer: J. Edwin Larson
Attorney General: Richard W. Ervin
Comptroller: Ray Green
Supt. of Public Instruction: Thomas D. Bailey

Constitution and Judiciary.—The present constitution went into effect in 1887. The Supreme Court comprises seven justices; chief justice in 1959 was Elwyn Thomas.

Legislature.—The Florida Legislature, comprising a 38-member Senate (in 1959, 37 Democrats and 1 Republican) and a 95-member House of Representatives (92 Democrats and 3 Republicans), meets in odd-numbered years commencing the first Tuesday after the first Monday in April.

The 1959 session (April 7–June 5) appropriated $714,067,970 from the General Revenue Fund for the 1959–61 biennium and extended sales and use tax coverage to many additional items, principally all sales of alcoholic beverages. School appropriations totaled $409,546,707, including $276,353,403 for the Minimum Foundation Program, $13,378,334 for junior colleges, and $27,500,000 for capital outlays.

The Pupil Assignment Law was strengthened, students in integrated schools were exempted from compulsory attendance, county school boards were permitted to segregate school pupils by sex, and citizen groups were allowed to set up private schools.

Unemployment compensation benefits were increased to $33 weekly and the maximum duration of claims extended to 26 weeks; revisions were made in requirements for workmen's compensation claims; and public employees, except for specified personnel, were prohibited from striking or belonging to organizations advocating strikes.

Other legislation provided for establishment of a children's psychiatric center at the South Florida State Hospital; set up a Suitable Home Law for dependent children; created a Citizens Advisory Committee for the Aged; and reorganized the Department of Agriculture. Motor boat registration was required, and water safety standards were established.

A constitutional amendment was proposed for the reapportionment of the Senate and the House (see below, *Principal Events, 1959*), and a joint resolution was promulgated (subject to voter approval) requiring at least 45% of racing taxes to be distributed to the counties.

Finance.—In the 1958–59 fiscal year, state revenue of $1,097,745,021.01 comprised $521,944,571.82 from state tax sources, $123,579,582.98 from the federal government, and $452,220,866.21 from all other sources. Tax revenue consisted of $148,148,363.38 from a 3% general sales tax, $115,343,958.52 from motor fuel taxes, and $258,452,249.92 from all other state tax sources. Expenditures of $1,110,769,702.47 comprised $224,875,289.04 for education, $204,520,766.32 for health, welfare, and safety, $177,678,128.44 for highways, and $503,695,518.67 for all other purposes. There was no state long-term indebtedness.

Banking.—As of June 10, 1959, the state's 104 national banks had $3,246,596,000 in assets, $2,205,266,000 in demand deposits, and $729,114,000 in time deposits. The state's 183 other banks (June 30, 1959) had assets of $1,798,946,523.70 and total deposits of $1,650,239,268.63.

Education.—School attendance is compulsory between the ages of 7 and 15, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $216,867,000 ($291.78 per pupil), and revenues comprised $111,158,705 from local school districts, $165,279,919 from the state, and $9,944,051 from the federal government. Outlays for construction and improvements amounted to $65,365,655, and salaries of all instructional personnel averaged $4,811.

FLORIDA SCHOOL STATISTICS, 1957–58

Type of school	No.	Teachers	Students
Public elementary (1–6)	1,250	17,811	555,978
Public junior high (7–9)	...*	...*	208,957
Public senior high (10–12)	485	13,594	130,945
Private and parochial elementary and secondary	396	2,295	50,856
Public junior colleges	7	259	7,224
Public colleges and universities	3	1,820	27,701

* Included in senior high figures.

Social Welfare.—In the 1958–59 fiscal year, public assistance expenditures from federal and state funds (excluding institutional costs) totaled $69,128,443, including $43,505,123 for the aged, $18,979,859 for dependent children, and $4,892,824 for the permanently and totally disabled. A monthly average of 106,158 persons received public assistance. State expenditures for all mental health activities totaled $22,877,087; for correctional and penal programs, $11,318,649.

Labor Force.—The state's labor force totaled 1,666,100 in July 1959, including 100,900 agricultural workers. Nonagricultural employees in all categories numbered 1,485,500, well above the 1,393,000 reported for the previous July and slightly above the 1,445,800 average for 1958. Of

New terminal building at Miami International Airport was dedicated in week-long ceremonies in January. The airport's $26 million expansion and development program followed an enormous increase in Miami air traffic in recent years.

WIDE WORLD

all persons employed, 27.5% were engaged in trade, 16.2% in government, 15.3% in manufacturing, and 14.1% in service industries. Unemployment dropped by almost 25% to 79,700 in July 1959 from 100,300 a year earlier. The state paid $29,277,407 in unemployment compensation claims in 1958.

Manufacturing.—Estimates for 1958 showed 6,650 manufacturing plants employing 177,600 persons who received $735,264,000 in wages. Value added by manufacture (1957) totaled $1,261,615,000, and outlays for new plant and equipment amounted to $181,757,000. In August 1959, production workers averaged $74.62 for an average workweek of 41 hours.

MAJOR FLORIDA MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.* (thousands of dollars)
Food and kindred products	35,859	$123,916	$322,069
Chemicals and products	13,651	56,298	196,504
Pulp, paper, and products	13,023	63,296	175,823
Printing and publishing	11,026	48,230	89,487
Fabricated metal products	9,980	38,480	84,067
Lumber and wood products	15,454	41,694	65,918
Stone, clay, glass products	7,236	25,098	57,490
Transportation equipment	9,858	41,671	56,296
Furniture and fixtures	7,660	23,303	41,398
Tobacco manufactures	7,924	21,459	38,233

* For definition, see text footnote 1 in the article *Industrial Production.* (Source: *Annual Survey of Manufactures: 1957.*)

Mining.—In 1958 Florida ranked 25th among the states with a record value of mineral output accounting for 0.86% of the national total. It was first in output of fuller's earth (59% of domestic production) and of phosphate rock and zircon and stood second in peat, titanium minerals, and rare-earth metals.

FLORIDA MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Clays	450,000	$ 5,808,000
Peat	36,438	165,000
Phosphate rock (long tons)	10,851,000	68,951,000
Sand and gravel	5,490,000	4,389,000
Stone[1]	23,549,000	30,983,000
Zirconium concentrate	30,302	1,018,000
Other minerals	...	34,008,000
Total	...	$142,111,000[2]

[1] Excludes certain stone; value included in "Other minerals."
[2] Total adjusted to eliminate duplications in value of clays and stone. (Source: U.S. Bureau of Mines.)

Fisheries.—The commercial fish and shellfish catch in 1958 was valued at $29,352,898. Principal species landed were shrimp, 51,110,580 pounds valued at $18,517,519; mullet, 35,677,921 ($2,221,026); and red snapper, 6,433,777 ($1,708,145).

Agriculture.—Cash farm income for the first nine months of 1959 was up to $629,556,000 from $521,270,000 in the corresponding 1958 period.

FLORIDA CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Avocados (tons)	9,110	4,100	8,300
Corn (1,000 bu.)	10,031	14,924	16,281
Grapefruit (1,000 boxes)	33,970	35,200	32,000
Limes (1,000 boxes)	322	200	300
Oranges (1,000 boxes)	78,110	86,000	93,000
Peanuts (1,000 lb.)	57,192	58,240	47,040
Pecans (1,000 lb.)	4,860	2,600	3,500
Potatoes (1,000 cwt.)	5,262*	5,977	4,944
Strawberries (1,000 lb.)	9,577*	2,600	3,300
Sugarcane for sugar (1,000 short tons)	1,249	1,303	1,771
Sweet potatoes (1,000 cwt.)	182*	72	75
Tobacco (1,000 lb.)	27,463	21,359	25,420
Tomatoes (1,000 cwt.)	4,868*	3,497	4,206
Tung nuts (tons)	17,380	35,000	33,000

* Average, 1949–57. (Source: U.S. Department of Agriculture.)

For the full year 1958, income comprised $194,605,000 from livestock and livestock products, $494,384,000 from crops, and $7,907,000 from government payments. Principal income sources were: oranges, $220,463,000; dairy products, $75,269,000; cattle, $65,121,000; grapefruit, $43,705,000; and greenhouse and nursery products, $34,207,000.

There were 62,500 farms in 1958. Total farm area (1954) of 18,162,000 acres included 1,936,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 2,011,000 cattle and 4,565,000 chickens (excluding commercial broilers). Some 98,000 family and hired workers were engaged in farming during the week of Oct. 18–24, 1959.

Tourism.—In the 10-year period since 1949, tourism in Florida has almost doubled in volume. Only the year 1958, which experienced a drop in the number of visitors, halted the steady rise. The 1958 season, affected by the national recession and a number of unusually severe freezes, nevertheless accounted for an estimated 7 million visitors who spent $1,160 million within the state. The 1959 volume, on the basis of data for the first nine months, was expected to reach a full-year total of nearly 9 million visitors. As 1959 ended, it was estimated that there were more than 425,000 rental units available in the state for tourists.

To facilitate tourist air arrivals a new $26 million terminal was opened on Feb. 12, 1959, at Miami International Airport. An outstanding addition to tourist accommodations in 1959 was the new 26-story, $6 million Robert Meyer Hotel in Jacksonville. New Florida tourist attractions of the year included a $2 million speedway at Daytona Beach, a bird park (Busch Park) at Tampa, and a seven-year statewide quadricentennial celebration. The latter was inaugurated on May 13 at Pensacola, where the first (although unsuccessful) settlement was made in 1559. The celebration was scheduled to close in 1965 at St. Augustine, which was permanently settled in 1565.

Transportation and Communications.—State and federal funds disbursed for highways in the 1958–59 fiscal year totaled $164,837,792.84, and 2,430 miles of new construction were completed.

Highways and roads on Dec. 31, 1958, totaled 64,840 miles (32,579 surfaced). Registered *motor vehicles* in 1958 numbered 2,346,775, including 1,766,671 passenger cars. There were (1958) 13 *railroads* operating 4,699.01 line miles; 56 regularly scheduled *airlines;* and (1959) 208 *airports and airfields* (121 commercial and municipal, 55 military, 12 private, and 20 other).

Communications media (1958) included 144 AM and 21 FM *radio stations;* 20 VHF and 1 UHF *television stations;* (1959) 48 daily *newspapers* (circulation, 1,427,089) and 164 other newspapers (968,610); and (Jan. 1, 1959) 571,500 business and 1,091,700 residential *telephones.*

Principal Events, 1959.—In his message to the 1959 session of the Florida Legislature, which convened April 7, Gov. LeRoy Collins strongly urged the lawmakers not to pass any new segregation laws and "never, never, never set up any plan or device by which our public schools can be closed." He maintained that the Pupil Assignment Law of Florida could be used to prevent wholesale desegregation and warned that any other approach would be disastrous and illegal. Despite some fiery speeches and many drastic proposals, the legislators on June 5 closed their session, leaving only a few mild bills regarding this issue on the governor's desk. (See also above, *Legislature.*) The following September, due to pending court action, two public schools in Dade County became the first in the state below the college level to open on a racially integrated basis.

In a highly unusual second message of April 9

to a joint session of the House and Senate, Governor Collins predicted a "devastating era of sectionalism" unless Floridians were given fairer representation in the legislature. Collins sought remedy for a situation in which North Florida, containing only a small fraction of the state's total population, controls the Senate, whereas Central and South Florida, with the larger portion of the population, carry the heavier burden of taxation. An amendment to the constitution, worked out by the legislature, proposed eight additional House members and six new Senate seats for the most populous counties. While regretting the proposal was not a better one, the governor called it "the greatest advance in 34 years."

On November 3 the reapportionment amendment was defeated. Vote-powerful Southeast Florida turned it down by 177,955 votes to 146,601. Dade (Miami), Broward (Fort Lauderdale), and Palm Beach counties accounted for 83,463 opposition votes, and virtually Republican Pinellas County voted 26,463 to 9,965 against the measure. Thus the decennial constitutional mandate for reapportionment, which bitter controversy had prevented from being carried out during the previous four years, continued to be unfinished legislative business at the end of 1959.

The spectacular advance in Florida of electronics and missile industries was dramatized in mid-1959 when the Orlando Division of the Martin Company, which came to Florida in 1956, emerged as the state's biggest manufacturing employer, with more than 8,000 workers.

Natural gas flowed into the economic veins of Florida from 1,477 miles away when a valve at the Brooker mainline compressor station of the Houston Corporation was opened in June. The new pipeline runs from producing fields in south Texas to a terminus south of Miami, and brings with it important fuel savings to existing industries and impetus for the building of new ones. The total investment budgeted by the corporation for facilities in Florida was $132,657,000, and an annual $6 million Houston payroll was predicted within four years.

In 1959 Florida became the first state to have placed over 5 million acres in tree farms. Its acreage devoted to plantings and tree farms exceeded the acreage being cut for timber. The state's forest products have reached a wholesale manufactured value of more than $450 million annually.

FOOD AND AGRICULTURE ORGANIZATION OF THE UNITED NATIONS. Founded in 1945 as a United Nations specialized agency, FAO aims to improve living standards and raise the nutritional levels of all peoples by improving their agriculture, fisheries, and forestry. In December 1959 it comprised 77 member nations and 9 associate members. On Nov. 18, 1959, Binay Ranjan Sen of India was re-elected to a 4-year term as director-general of FAO, and Louis Maire of France was elected chairman of the FAO Council.

FAO's biennial budget for 1958–59 amounted to $17,128,646. In addition, FAO was allocated over $9 million each year (1958–59) to finance its Expanded Technical Assistance Program. The organization had over 400 technical assistance experts at work in 72 countries in mid-1959, when the number of completed assignments had risen to 2,030. More than 220 Technical Assistance Program fellowships were scheduled for the year, and the total number awarded since the program began in 1951 rose to 1,746.

FAO's Freedom from Hunger Campaign, proposed by Director-General B. R. Sen, is intended to focus attention on the continuing problem of hunger in the world and to mobilize national and international efforts toward its solution. With the world population still growing—it increased by 1.7% in the less developed countries and by 1.2% in the more developed areas during 1959—there is an urgent need to produce more and better food, to increase the incomes of agricultural populations, and to improve the distribution of food. The campaign will be carried out with the cooperation of governments, the United Nations and its specialized agencies, and various nongovernmental bodies. Efforts will be made to inform and educate world opinion regarding the hunger problem, and the campaign will culminate in a World Food Congress in 1963.

FAO's World Seed Campaign seeks to promote the use of better seeds by farmers, and it is planned to designate 1961 as the World Seed Year.

The organization's Mediterranean Development Project is concerned with the arable and grazing land, forests, and irrigation of 18 countries in the Mediterranean region. Teams of experts have prepared reports on 10 of these countries—Greece, Iraq, Israel, Lebanon, Morocco, Spain, Syria, Tunisia, Turkey, and Yugoslavia. With the completion of the overall study and these country reports, which were considered by the FAO Conference at its meeting in November 1959, it is hoped that governments concerned will promote national pilot projects.

Much progress was made during 1959 in FAO's program in atomic energy. For example, an international training course on radioisotope techniques in agricultural research was organized at the Laboratory of Radiation Biology, Cornell University, Ithaca, N.Y.; and a European seminar on the training of agricultural advisory services on agricultural aspects of environmental contamination was organized at Cambridge University, England.

An overall picture of the world food situation in 1959 showed that production had reached a record level, being up 4% over that of the previous year, while surplus stocks had increased by 10%. Of the surpluses, North America held 80%. These growing surpluses, the unfavorable terms of trade of agricultural exporters, the need for adjustments in agricultural policies of individual countries, and a tendency toward regional arrangements, were the main features of the commodity situation. In general, FAO's principles of surplus disposal were found as adequate today as when developed in 1954.

An FAO expert panel met in April 1959 and prepared a report on price support and stabilization measures. The panel suggested 25 guiding principles to mitigate the harmful effects of such measures on consumption and to reduce the accumulation of surpluses.

A regional office for Africa was opened in 1959 at Accra, Ghana. It will be supported by two suboffices which will shortly be established elsewhere on that continent.

Agriculture.—In 1959 much progress was made in the soil mapping of Europe and Latin America, and a Development Center on Farm Management Problems was held in Bangkok. The interregional desert locust-control project placed particular emphasis on the coordination of the international campaign in the Arabian Peninsula.

Special attention has been given to establishing standards of comparability for the various systems in use for performance and progeny testing of animals, and work continued on artificial insemination. Much progress was made in Africa and the Far East in the control of rinderpest, and FAO was active in fostering development in research for the production of more effective vaccines against foot-and-mouth disease and hemorrhagic septicemia. FAO cooperated with the United Nations Children's Fund (UNICEF) in developing dairy industries in member countries, where surveys were made for the planning of future dairy programs and technical advice was provided in establishing and running new dairy plants.

Economics.—The first international meeting in the Far East on agricultural marketing, especially of rice, was held in 1959 at New Delhi, and a crop insurance experiment was started in Ceylon with the assistance of FAO. A special study of agricultural incomes and living standards in countries varying in economic development was made during the year. Work continued on the program for the 1960 World Census of Agriculture, which has been adapted to regional requirements. Census seminars were conducted in 1959 at Accra and Warsaw, while training centers were held at Lima, Tokyo, and Damascus.

Fisheries.—The Second World Fishing Boat Congress was held at FAO headquarters in April 1959. Some 50 technical papers were presented and more than 300 participants from 35 countries attended. There were also meetings on fishery cooperatives and statistics, and a statistics training center. A World Scientific Meeting on the Biology of Sardines and Related Species was held at FAO headquarters.

Forestry.—The regional forestry commissions for Latin America, the Near East, and Europe formulated their work programs for the next two years. The European Forestry Commission discussed particularly the impact of economic integration schemes on Europe's forestry. Planning for the World Forestry Congress in 1960 was continued. A study of wood resources and requirements for Asia and the Far East was completed. (See also FORESTRY.)

Nutrition.—FAO continued its nutrition work in association with the World Health Organization (WHO) and UNICEF. Nutrition problems in a number of countries, including Ghana, were studied, and immediate and long-term plans drawn up in consultation with the governments concerned. Further attention was given to the improvement of diet through education in nutrition, and to the contribution which home economics can make. Regional and national nutrition and home economics seminars were convened in various parts of the world.

An evaluation survey was made of the results achieved by the distribution of skim milk through UNICEF-assisted programs, and methods of improving distribution were recommended. Attention was given to the development of protein-rich foods other than milk and, in cooperation with WHO, to problems arising out of the increasing use of food additives. A seminar on food technology for countries in South and East Asia was held in India.

Publications.—In addition to its regular yearbooks, periodicals, and bulletins, FAO publications in 1959 included: a series of *Marketing Guides* dealing with *General Problems, Fruits and Vegetables, and Eggs and Poultry; Uses of Sampling in Census; Income Elasticity for Food; National Grain Policies;* Reports on *Rice, Dairy Products, Olive Oil, Tea, Coffee,* and *Coconut; Land Consolidation in Europe; State of Food and Agriculture 1959; Tabulated Information on Tropical and Sub-Tropical Grain Legumes; World Cocoa Survey; Study of Grasses in Agriculture; Irrigation by Sprinkling; Application of Science to Inland Fisheries* (Fisheries Study No. 8); *Modern Fishing Gear of the World* (ed. by Hilmar Kristjonsson); and *Fishing Boats of the World,* vol. 2 (ed. by Jan-Olof Traung).

BINAY RANJAN SEN,
Director-General, FAO.

FOOD AND DRUG ADMINISTRATION. As a member agency of the U.S. Department of Health, Education, and Welfare, FDA enforces the Federal Food, Drug, and Cosmetic Act of 1938, as well as four other laws. Enforcement of these laws is intended to ensure the healthfulness and purity of foods, and the safety and effectiveness of drugs, cosmetics, and therapeutic devices. Seventeen district offices, with another scheduled to begin operations, coordinate their enforcement activities with offices in Washington, D.C.

FDA's educational program was intensified in 1959, particularly in the areas of nutritional quackery and deception arising from weight-reducing schemes. Widespread sales of mislabeled vitamins, minerals, and food supplements to health-conscious Americans, and unscrupulous sales of so-called weight-reducers—worthless mechanical devices and bogus diet aids—precipitated a vigorous campaign by FDA to control this growing problem.

Foods.—The 1958 Food Additives Amendment to the Federal Food, Drug, and Cosmetic Act played an important role in FDA operations in 1959. The death of a child and several illnesses traced to the addition of sodium nitrite to flounder fillets pointed to the importance of assuring the safety of chemical substances before they are added to food. Consumer protection against excessive pesticide residues was increased by extensive collections and analyses of crops, and by close surveillance of pesticide spray practices. Seizures were made where foods displayed unpermitted residues. Attention also was given to the improper use of antibiotics in medication of cows, which results in milk residues. The sampling for radioactivity of foods and feeds was continued.

Educational efforts in FDA's corn and wheat programs were extensive. Samplings of bulk wheat being shipped in the fiscal year 1959 resulted in federal seizure of 76 lots. Sixty-seven criminal cases charging shipment of filthy or decomposed food were instituted, and 68 similar cases were terminated in the courts, with penalties ranging from probation to a $4,500 fine. Injunctions to prevent distribution of foods in violation of sanitary requirements were requested against 12 firms.

Filth or decomposition was charged in 79 per cent of the food seizures; and 7,430 tons were seized in 656 actions. Of these, 336 seizures involved merchandise that became unfit after interstate shipment. An additional 7,964 tons of unfit food were voluntarily destroyed or converted to nonfood uses by their owners as the result of FDA inspections. Prosecution actions were filed against 18 firms for storage of food under unsanitary conditions.

Drugs and Devices.—Ninety-five criminal actions charging drug violations were filed in the fiscal year 1959. Of these, 72 cases involving 140 defendants were filed on charges of illegal sales of prescription drugs. Sixty-nine cases against 124 defendants were terminated in federal courts, with jail sentences ranging from 6 months to 2 years. Fines ranged from nominal sums to $3,000. Bootleg sales of amphetamines continued in 1959 despite efforts to determine where the amphetamines were diverted from legitimate drug sales.

Twenty-seven defective or misbranded drugs were recalled by manufacturers during the fiscal year 1959. Eighty-three seizures were made of drugs bearing false and misleading therapeutic claims, and 36 drugs were seized because of failure to meet official or declared composition. In addition, four injunctions involving drugs and devices were requested of the courts. Fifty-seven devices were seized because of false and misleading claims by their makers.

FDA approved 273 new-drug applications and made effective 1,067 supplemental applications.

Predistribution Certification.—In fiscal 1959, 5,262 batches of coal-tar colors, representing 7,348,717 pounds, were certified for use in foods, drugs, or cosmetics. Recent laboratory studies on animals produced evidence that 17 coal-tar colors were harmful when taken in significant amounts. Thirteen of these colors, in addition to 7 previously banned for food use, will continue to be certified for use in drugs and cosmetics that do not get into the digestive system. The remaining four have been removed entirely from the list of certifiable colors. Other certification programs involved the testing of 350 batches of insulin and 13,716 batches of antibiotics before they could be marketed.

Enforcement of Other Acts.—Under the Tea Importation Act, 109,809,995 pounds of tea were examined in fiscal 1959, of which 99,367 pounds were rejected as substandard. Four cleaners were seized for failure to bear the word "poison" as required by the Caustic Poison Act. No permits were issued under the Import Milk Act, nor were there any actions under the Filled Milk Act.

VIVIAN R. BOARDMAN,
Publications Officer, Division of Public Information, Food and Drug Administration.

FOOD RESEARCH. Meat Quality.—Research in the area of meat quality has increased materially during the past year or so. For the most part it has centered around identifying the factors causing or associated with tenderness; determining the interrelationships of various chemical, physical, and sensory measurements; and evaluating quality directly by consumer acceptability studies.

Currently, considerable attention is being given to the muscle plasma fraction of meat as a possible factor in determining tenderness. One theory now being tested is that tenderness may be related to the degree of hydration of the meat proteins. Evidence has been presented which shows that the water-holding capacity of ground beef and pork is directly related to pH when the latter is within the normal range for meat (5.4 to 6.9). Shifts in pH, however, effected greater change in the water-holding capacity of fresh than of cooked meat, a result interpreted as indicating that heat denaturation of muscle proteins destroys a major portion of the water-holding forces which result from the addition of hydrogen or hydroxyl ions to meat.

Evidence has been presented that a more precise delineation of tenderness by trained judges is possible if this trait is separated into two components, one associated with the tenderness of muscle tissue and the other with that of connective tissue.

The extent to which connective tissue affects tenderness in meat still intrigues investigators. The suggestion has been made recently that selective enzymes might be used to disentangle collagen and elastin from the other meat proteins. Before such a method is developed, however, properly selective enzymes will have to be prepared in reasonably pure form.

The degree to which hereditary differences are responsible for observed differences in the tenderness of meat is under study. Present results indicate that the heritability of tenderness is probably high or moderately high. Considerable variation in this trait exists, however, among the progeny of sires from the same as well as from different breeds.

Various chemical, physical, and sensory evaluations of the quality of over 300 beef carcasses indicated that tenderness of lean increased as external and internal finish increased and as lean became firmer. Tenderness was significantly related to overall preference, but juiciness and flavor were not.

Consumer acceptability is being investigated largely through furnishing families with comparable retail cuts from carcasses of different federal grades and having each adult member indicate preference and/or degree of acceptability. In most of the studies a significant proportion of the consumers preferred the meat from the higher-grade carcasses, but there were a few who consistently preferred that from the lower grades. Results suggest that consumers, although agreeing on overall quality, differ considerably in the relative importance of flavor, tenderness, and juiciness.

Food Flavors.—Control of flavor problems is being sought through fundamental investigations of the chemical identity, origin, and mode of formation of flavor compounds. Problems in this area are concerned with maintenance of characteristic flavors, as in processing frozen juice concentrates; with development of desired flavors, as in roasting coffee; and with prevention of development of off-flavors, as in irradiating foods. Progress has been made in identifying some flavor compounds in some foods. For example, about 30 compounds have been identified from strawberry and orange juice concentrates, and a somewhat smaller number from grapefruit juice concentrate. But in none of these foods, nor in fact in any food, do the experimenters feel that the flavor has been fully characterized. Results to date show that food flavors are exceedingly complex mixtures of chemicals which vary greatly in their amounts, volatilities, and flavor intensities.

The origin and mode of formation of flavor compounds have received relatively little attention. Flavor precursors in cabbage and onions are among the few which have been studied. In these studies, L-S-methylcysteine sulfoxide was identified as the principal precursor of dimethyl disulfide, the constituent mainly responsible for the odor of cooked cabbage. S-allyl-cysteine and S-propyl-cysteine sulfoxide were found in aqueous onion extract, and the possibility of their being precursors of compounds responsible for the odor of onions has been suggested but not investigated.

Evidence of flavor precursors in dehydrated vegetables has been provided by a recent study. When enzyme preparations from white mustard seed were added to dehydrated watercress in water, the typical odor and taste of watercress was regained within a short time. Rehydration with water alone produced a product which had none of the characteristic odor or taste of watercress. Dehydrated cabbage also reacted with white mustard seed enzyme to give an increase in flavor. For such products maximum regeneration of flavor required water and adequate amounts of appropriate enzymes and precursors to react within the allotted time.

Investigation of food flavors has been aided tremendously by new analytical methods, particularly those of gas chromatography and mass spectrometry. The former provides a relatively simple method of separating a mixture of gases or easily volatile compounds into the individual components. Emanations from coffee have been studied directly by this method with considerable success. Aqueous extracts or press fluids from foods must be freed of much of their moisture, however, before the flavor compounds are concentrated enough to be detected by present instruments. During concentration, decomposition of flavoring materials may occur. It is to be hoped therefore that the new detectors which are becoming available for gas chromatography apparatus will be sensitive enough to respond to the flavor compounds at the concentration levels of the original extract.

Botulinal Toxins.—The nature of the neurotoxins produced by *Clostridium botulinum* is being clarified. These toxins are of particular interest because they are the most potent poisons known. Present evidence indicates that they are simple globular proteins. Type A has been obtained in a white, odorless, crystalline form. In many respects this material acts as if composed of homogeneous, single, large molecules. For example, separately prepared samples show constant biological activity and amino acid composition; recrystallization does not increase toxic potency; during electrophoresis, all of the molecules migrate at the same rate; and during ultracentrifugation a single sedimenting boundary appears at various pH values on the acid and alkaline side of the isoelectric point.

In other respects, however, crystalline toxin does not meet the tests of homogeneity. Thus, discrepancies are found in the amounts of precipitate formed when toxin and antitoxin are mixed at different temperatures. These discrepancies led to the discovery that crystalline type A toxin could be separated into two factors, the toxin and hemagglutinin, by selectively adsorbing the hemagglutinin to erythrocytes. These results indicate that crystalline type A toxin is a complex in which toxin and hemagglutinin exist in an intimate association of unknown type.

The nature of the molecular configuration responsible for toxicity has not been determined. The view that maintenance of the structural integrity of the protein molecule as a whole is required for toxicity is supported by the fact that proteolytic enzymes and chemical reagents which cause loss of toxicity attack bonds characteristic of simple proteins.

FOREIGN AID PROGRAMS, U.S. The United States spent $68.9 billion in foreign aid from the end of World War II through June 30, 1959, or approximately $391 for every person in the country. Of the total, $56.9 billion was extended in outright grants, and $12.0 billion in net credits. The chief purpose of these grants and credits at the end of the war was European reconstruction, and this purpose prevailed through the period of the Marshall Plan (1948–52). Communist aggression in Czechoslovakia (1948) and Korea (1950) shifted the emphasis to military aid, however, and its share of the total has remained high, as is shown in Table 1. Nevertheless, the raising of the economic level of the less developed countries was conceived, by President Harry S Truman in his Point Four Program and by President Dwight D. Eisenhower in his various messages to Congress, as an important means of stemming the advance of communism, particularly in areas outside Europe.

Table 1—NEW FUNDS AVAILABLE FOR MUTUAL SECURITY, 1948–60[1]

(Millions of dollars, for years ending June 30)

Fiscal year	Total new funds	Military assistance[2]	Military as % of total
1948–49	6,387	none	0.0
1950	5,173	1,314	20.6
1951	7,339	5,223	71.0
1952	7,282	5,267	72.3
1953	6,012	4,086	68.0
1954	4,724	2,814	59.6
1955	2,781	1,193	42.9
1956	2,703	1,022	37.8
1957	3,767	2,018	53.6
1958	2,769	2,029	73.3
1959	3,298	2,265	68.7
1960	3,226	1,995	61.8

[1] Figures before 1955 reflect slight adjustments in the annual appropriations to include statutory transfers or reimbursements from accounts or sources outside the Mutual Security Program. From 1955 on the actual amount of the annual appropriation is given. [2] Includes defense support. (Sources: U.S. International Cooperation Administration, Office of Research, Statistics and Reports; Public Law 86–383.)

Since World War II the administration of United States foreign aid has passed through four major phases.[1] The fourth and current period began on June 30, 1955, when the International Cooperation Administration (ICA) was established within the Department of State. Military aid is administered by the Department of Defense. The Mutual Security Act of 1959 provided that military assistance for the fiscal years 1961 and 1962 be included in the defense budget, and on Nov. 21, 1959, Gen. Williston B. Palmer was appointed to the newly created post of director of military assistance.

Developments Through the Fiscal Year 1959.— According to a report prepared by the Office of Business Economics of the U.S. Department of Commerce, foreign countries received $4,401 million in commodities, services, and money through United States net grant and long-term credit programs in the fiscal year ending June 30, 1959. In addition, $170 million in short-term assistance was available through the sale of United States agricultural products against foreign currencies. Total United States foreign aid in the fiscal year 1959 therefore amounted to $4,571 million, or about 6% less than in the fiscal year 1958.

As is shown in Table 2, total net grants and long-term credits were $160 million lower in the fiscal year 1959 than in the preceding year. Whereas nonmilitary grants rose from a postwar low of $1,548 million to $1,630 million, military grants declined by $236 million, to $2,162 million. Foreign credits by the United States government were utilized in the amount of $1,276 million, or $141 million more than in 1958. Disbursements by the Export-Import Bank of Washington declined by $52 million, to $708 million, while loans extended to foreign governments under the Agricultural Trade Development and Assistance Act more than doubled, reaching $328 million. Net credits under the Mutual Security Program declined from $226 million to $171 million, but payments by the Development Loan Fund reached $68 million, and total mutual security credits therefore rose by $12 million, to $240 million. Repayments, on the other hand, reached a record $668 million largely because of an advance repayment by West Germany of $150 million on a 1953 credit settlement. The resulting net credits outflow of $608 million was only $8 million lower than in the 1958 fiscal year.

Table 2—U.S. NET FOREIGN GRANTS AND LONG-TERM CREDITS, FISCAL YEARS 1958 AND 1959

(Millions of dollars)

Area and type	Fiscal year 1958	Fiscal year 1959
Total	$4,561	$4,401
Military supplies and services	2,398	2,162
Other net grants and long-term credits	2,164	2,239
Western Europe and dependent areas[1]	1,147	736
Military supplies and services	799	722
Other net grants and long-term credits	348	14
Eastern Europe (nonmilitary aid)	19	24
Near East, Africa, and South Asia	1,116	1,367
Military supplies and services	622	554
Other net grants and long-term credits	494	813
Far East and Pacific	1,755	1,526
Military supplies and services	877	810
Other net grants and long-term credits	878	716
American republics	404	621
Military supplies and services	73	50
Other net grants and long-term credits	331	571
International organizations and unspecified areas	120	127
Military supplies and services	26	26
Other net grants and long-term credits	94	101

Note: Because of rounding, totals do not necessarily add up.

[1] Because of the inclusion of dependencies in the grouping "Western Europe," data shown for other groupings, particularly "Near East, Africa, and South Asia," are correspondingly understated. Greece and Turkey are included with "Near East, Africa, and South Asia." (Source: U.S. Department of Commerce, Office of Business Economics.)

In the 1959 fiscal year the Far East and Pacific area received slightly more than a third of all aid delivered,

[1] The first phase, extending from 1945 to 1948, was marked by the founding of the International Bank for Reconstruction and Development and the International Monetary Fund, but otherwise aid was extended under *ad hoc* and emergency grants without central organization. In the second phase increasing world tension led to the launching of the Marshall Plan or European Recovery Program (ERP) under the Economic Cooperation Act of 1948, which was administered by the Economic Cooperation Administration (ECA). The Mutual Defense Assistance Program (MDAP) was established in 1949. Military and economic types of assistance were subject to final oversight by a coordinating committee of representatives from the Departments of State and Defense and from ECA. The third phase, extending from 1951 to 1955, began with a general shift of emphasis from economic to military aid. The period was marked by efforts on the part of the administration to counteract centrifugal tendencies in the conduct of foreign aid. The Mutual Security Act of 1951, which abolished the ECA, attempted to centralize foreign aid programs by establishing the Mutual Security Agency (MSA) in the Executive Office of the President. On Aug. 1, 1953, President Eisenhower created a new foreign aid authority, the Foreign Operations Administration (FOA), charged mainly with responsibility for operations in the field of foreign aid, while the State, Defense, and Treasury departments bore responsibility for policy. There were increasing demands from Congress that the operating functions be returned to the Department of State, and the International Cooperation Administration was accordingly established in 1955.

with military assistance accounting for over half of the total. It was followed by the Near East (including Greece and Turkey), Africa, and South Asia, where assistance consisted chiefly of nonmilitary grants and credits. In third place was aid to western Europe, almost all of which took the form of military supplies and services. The distribution of military grants remained about the same as in the 1958 fiscal year, the decline in the total affecting all areas. Deliveries to the Far East and Pacific accounted for almost two fifths of the total, while those to western European countries continued to aggregate about a third of all military assistance.

In contrast to the trend in military aid, the distribution of nonmilitary assistance changed markedly in the fiscal year 1959. The share of the Far East and Pacific area declined from two fifths of all nonmilitary net grants and long-term credits in the previous fiscal year to less than a third of the total, while that of the Near East, Africa, and South Asia rose from less than a fourth to over a third, and that of the American republics increased by 75%, to account for a fourth of the nonmilitary aid.

In the Near East, where grants accounted for four fifths of all nonmilitary assistance, the chief recipients were Turkey, Jordan, Iran, Israel, Greece, Lebanon, and the U.N. Relief and Works Agency for Palestine Refugees in the Near East. Aid to Turkey, which rose from $66 million in the previous fiscal year to $172 million, consisted mainly of deliveries to improve the country's balance-of-payments situation. The $62 million disbursed to Iran included substantial loans from the Development Loan Fund, while aid to Jordan ($64 million) and Lebanon ($32 million) included relief shipments of grain. Net assistance to Israel ($44 million) and Greece ($34 million) declined slightly from the previous year.

Nonmilitary aid to South Asia rose from $184 million in the 1958 fiscal year to $286 million in the 1959 fiscal year. The largest recipients were India ($106 million) and Pakistan ($151 million), both of which borrowed from the Development Loan Fund and also received major grants of farm products. In Africa, grants to Tunisia increased from $9 million to $35 million, and those to Libya from $12 million to $21 million.

South Korea and South Vietnam continued to be the major recipients in the Far East and Pacific area, where grants accounted for nine tenths of all nonmilitary assistance. Japan, which received $104 million in new loans and made repayments totaling $65 million, was the only country in which loan assistance played an important role. While deliveries to South Korea declined from $327 million in the 1958 fiscal year to $293 million in 1959, and those to South Vietnam from $232 million to $167 million, those to Taiwan ($76 million) remained about the same, and those to Thailand increased from $27 million to $39 million. Aid to the Philippines ($24 million), Cambodia ($24 million), and Laos ($26 million) also declined.

Argentina ($65 million) and Brazil ($165 million), both of which received major loans from the Export-Import Bank of Washington, led other Latin American republics in nonmilitary assistance in the fiscal year 1959. The area as a whole received $600 million in new credits, or well over half of the total, but repayments amounted to only $137 million, to which Brazil contributed $74 million. Aid to Mexico, almost all in the form of credits, rose from $37 million in the previous fiscal year to $65 million, and that to Peru from $58 million to $63 million. Declines were registered in deliveries to Colombia ($60 million), Chile ($44 million), Bolivia ($23 million), and Guatemala ($11 million).

In western Europe only six countries received net nonmilitary assistance in the fiscal year 1959: Yugoslavia ($165 million), Spain ($83 million), Italy ($38 million), Austria ($11 million), Iceland ($7 million), and France ($1 million). Major net repayments on earlier loans were made by West Germany ($182 million) and the United Kingdom ($67 million). In eastern Europe, aid to Poland amounted to $24 million, consisting mainly of loans from special presidential funds.

Foreign Aid Program for the Fiscal Year 1960.— Foreign aid came under close scrutiny in 1959, both by Congress, which made substantial cuts in President Eisenhower's requests, and by the President's Committee to Study the Military Assistance Program, headed by William H. Draper, Jr. In his message to Congress of March 13, 1959, the president proposed a Mutual Security Program authorization of $3,929,995,000 for the fiscal year 1960, but the bill passed on July 22, 1959, authorized a maximum of $3,556,200,000. (An additional $1,200,000,000 was authorized for the Development Loan Fund for the fiscal year 1961.) The foreign aid appropriations bill approved by Congress on September 15 provided only $3,225,813,000 in new funds, as is shown in Table 3. Military assistance was cut by $300 million from the president's request, defense support by $140 million, and the Development Loan Fund by $150 million.

In four reports submitted to the president between March 17 and August 20, the Draper Committee made an exhaustive study of both economic and military assistance. It recommended that military assistance be increased to at least $2 billion annually, with most of the increase being devoted to missiles for the members of the North Atlantic Treaty Organization. The program should be authorized for more than one year and be included in the budget of the Department of Defense (these two recommendations were adopted). The committee also recommended that the Development Loan Fund be given an authorization of $1 billion annually for five years. Insofar as general economic assistance was concerned, the committee found that there was justification for charges by congressional critics and others that the programs were marred by maladministration and waste, but stated that they "must be continued and better administered, not emasculated or abandoned." It recommended that a single agency outside the Department of State be responsible for economic aid.

Table 3—MUTUAL SECURITY APPROPRIATIONS FOR THE YEAR ENDING JUNE 30, 1960[1]

Distribution	Amount
Military assistance	$1,300,000,000
Defense support	695,000,000
Development Loan Fund	550,000,000
Technical cooperation:	
General authorization	150,000,000
United Nations program	30,000,000
Organization of American States	1,200,000
Other programs:	
Special assistance	245,000,000
Intergovernmental Committee for European Migration	7,371,000
U.N. Refugee Fund	1,100,000
Escapee program	4,632,000
U.N. Children's Fund	12,000,000
U.N. Relief and Works Agency	25,000,000
Ocean freight charges	1,910,000
Administrative expenses:	
International Cooperation Administration	38,000,000
Department of State	8,100,000
Atoms for Peace program	1,500,000
President's contingency fund	155,000,000
Total	$3,225,813,000

[1] Approved Sept. 28, 1959; new appropriations only. (Source: Public Law 86–383.)

The Development Loan Fund, established in 1957, greatly expanded its operations in 1959. By September 15, it had approved loans totaling $833,656,000 to borrowers in 39 countries. India, with 8 loans totaling $195,000,000, and Pakistan, with 13 loans totaling $111,550,000, were the major borrowers. Appropriations through the fiscal year 1960 totaled $1.4 billion. The fund is designed to advance the economic growth of less developed countries by extending loans for which capital cannot be obtained elsewhere, and repayment is accepted in local currencies. A similar agency on an international scale, the International Development Association (q.v.), first proposed by Sen. A. S. Mike Monroney, was inaugurated in 1959. The new organization was intended to associate other industrialized nations with the United States in assisting underdeveloped countries.

The belief of the Eisenhower administration that the industrialized nations were now financially able to extend long-term loans to less developed countries, coupled with a desire to reduce the large deficit in the United States balance of payments, was responsible for the introduction of a disputed "Buy American" policy for foreign economic aid. First announced on Oct. 19, 1959, for the Development Loan Fund, it was extended on November 16 to development projects financed through ICA funds. In future such funds would

ordinarily be spent on goods produced in the United States.

Associate Professor of Economics, University of California, Berkeley.

FOREIGN INVESTMENTS. United States investments abroad continued to rise at the record rate of about $5 billion during 1958. As in the previous year, private investment accounted for $4 billion. The growth in direct investments, however, declined from the previous year's record rate of $3 billion to about $1.8 billion in 1958, and totaled more than $27 billion at year-end. Government investments, through additional credits and loans, provided an additional $900 million. Foreign investments in the United States also moved upward at a fast rate ($3.4 billion to $34.8 billion). However, the increase in market prices of United States securities accounted for $2 billion of this rise, while the investment of new private foreign capital was insignificant. Holdings by foreign countries (mainly Europe and Japan) of liquid dollar assets, even after gold purchases in the United States of $2.3 billion in 1958, increased by about $1 billion, reflecting their favorable balance of payments position with the United States.

During 1959 the net outflow of United States capital continued to decline from the level of earlier years. While direct investments of business firms in foreign branches and subsidiaries expanded over the year before, the high prevailing interest rates in the United States reduced the flow of American funds into foreign bonds and securities and limited bank loans to foreigners.

ments: first, the renewed interest of United States manufacturing companies to venture into foreign investments, frequently for the first time and in partnership with foreign interests; and second, the interest of some companies with long-established foreign operations to buy out foreign minority holders. Examples of this desire to obtain more or sole control of foreign affiliates are Ford Motor Company, which spent about $150 million to increase its ownership in its Canadian affiliate; and Timken Roller Bearing Co. and International Business Machines Corp., which spent substantial amounts to buy out the minority interests in their British subsidiaries.

Canada.—Of all areas, Canada accounted for the largest amount of new United States investments, with an increase of $600 million to $8.9 billion at year-end 1958. Two thirds of these new investments were accounted for by new capital investments, while one third of the growth was financed by the reinvestment of earnings of existing enterprises. Somewhat more than one half of these new funds went into the development of natural resources in the oil and mining industries. Most of the remainder was spent by manufacturing industries. As in most other areas, investment activity in Canada was considerably below the level of 1957. It mirrored the broad decline of industrial activity in Canada and the development of excess capacity in certain industries, especially petroleum. However, some new mining projects were noted, especially in the development of iron ore.

The continued interest in the development of mining operations, the removal of the quota on Canadian oil imports into the United States, and

[1] Direct investments at book value; securities at market value; other investments at stated values. [2] Consist primarily of securities payable in foreign currencies but include some dollar obligations, including participation in loans made by the International Bank for Reconstruction and Development. [3] Includes United States currency, not distributed by area, of $847 million at the end of 1957 and $890 million at the end of 1958. (Source: U.S. Department of Commerce, Office of Business Economics, and estimates by the author.)

Direct Investments.—During the first nine months of 1959, direct United States investments abroad increased by about $1.75 billion. Of this total, the net capital outflow was nearly $1 billion, or at an annual rate of about $1.3 billion, nearly 20% above the previous year's rate. Reinvestment of undistributed subsidiary earnings was on the upgrade during 1959, as companies drew more heavily on this source of funds to finance the higher level of investment in foreign properties. Investment flows were buoyed by two opposed developments: a fresh expansion of manufacturing operations in Canada promised to renew the period of growth in 1959.

Latin America.—After the record rise of $1.3 billion in United States direct investments in the area in 1957, the total for 1958 fell to just above $400 million. While political difficulties and upheavals in several countries contributed to this drop, the main cause was both the singularity of some of the expenditures in the earlier years and economic and marketing difficulties in 1958 and

1959. The petroleum industry, which accounted for $900 million of the new investments in 1957, invested about $150 million in 1958. About $250 million of the 1957 amount represented payments for new leases, but the remainder represented a considerable decline in new development and plant expenditures. However, there was an upturn in activity in a number of other countries, such as Argentina and Bolivia, as well as in Central America. Manufacturing investments in Latin America also declined in 1958 in most countries, although some increase was noted in Brazil and Venezuela.

Europe.—Continued prosperity in western Europe caused a considerable flow of new United States capital to both the United Kingdom and the Continent in 1959. In 1958, when economic activity was slowed, direct investments rose by $400 million to a total of $4.4 billion at year-end. The decline from the earlier year could be traced to a drop in capital flows and reinvested earnings of the petroleum industry. In contrast to this decline of new funds from the United States, expenditures by industry for development, plant, and equipment actually increased as companies raised a larger proportion of the required funds in local capital markets.

Investment in European Economic Community (q.v.) countries was substantially above earlier years' levels, indicating the interest of United States businessmen in the prospects of the area.

Capital flows to the United Kingdom were reduced in 1958, particularly in the petroleum industry, while reinvested earnings declined in that industry as well as in manufacturing. The strengthening of European currencies and liberalization or virtual abandonment of old exchange control measures was an encouraging sign, and together with the already planned expansion in petroleum and manufacturing industries, it should cause an upswing in capital flows to Europe.

Other Areas.—Investments in Africa, exclusive of Liberian shipping operations, rose by about $80 million to $789 million in 1958. Most of these new investments were made in the newly developing areas in western Africa and in oil exploration and development in northern Africa, primarily Libya and Algeria. Manufacturing investments in the Union of South Africa expanded moderately. In the Middle East, investments in the petroleum industry rose at a better pace than in 1957, raising the total by $100 million to more than $1.3 billion at year-end. In the Far East, an increase in manufacturing investments in Australia and increases in the Philippines were notable. Direct investment in that area rose to nearly $1.7 billion at the end of 1958. Investments by United States shipping companies in foreign flag fleets also rose by $78 million. These ships are largely operated through Liberian and Panamanian subsidiaries.

Other Investments.—During 1958, United States purchases of foreign dollar bonds reached a peak of about $900 million. Of this total, Canada and the International Bank for Reconstruction and Development accounted for about $350 million each; Israel obtained about $50 million; and 11 other countries accounted for an additional $100 million. With interest rates in the United States rising in the latter part of 1958 and 1959, much of this borrowing was discouraged and the total for 1959 was down to about one half the rate for 1958.

Purchases of foreign corporate securities were also reaching for a new high in 1958, amounting to about $330 million. This movement remained strong through the early part of 1959 but appeared to be slackening in the later months, partly due to rising market prices of foreign securities.

Rising United States interest rates also slowed down the outflow of United States bank loans, and in the early part of 1959 the amount of outstanding short-term bank loans actually declined. Net outflows in long-term bank loans continued at a smaller scale in 1959.

United States government credits and short-term assets abroad continued to rise moderately in 1958. However, in 1959, the government subscribed an additional $1,375 million to the International Monetary Fund, and commitments of $3,175 million were made to guarantee additional obligations of the International Bank for Reconstruction and Development. Participation in new regional development banks was also agreed to.

Foreign Investments in the United States.—After the decline of foreign investments in 1957, these investments moved strongly upward in 1958, mainly due to price advances of United States securities held by foreigners and the accumulation of liquid dollar assets. During 1959 this development continued. In the first six months of the year, foreigners added $2.2 billion to their dollar reserves and, in addition, purchased $130 million of corporate securities. While foreign direct investments in the United States increased only moderately in 1958, some sizable new investments were made in 1959. Much of the capital for these new ventures, however, came from United States capital markets.

Earnings of Foreign Investments.—While earnings on United States investments abroad declined by $220 million to $3,677 million, earnings on foreign investments in the United States rose from $770 million in 1957 to $786 million in 1958. Earnings on United States direct investments abroad declined by $380 million to $2,954 million. Most of this decline resulted from a decline in earnings of the petroleum industry, reflecting higher foreign taxes, increased exploration costs, and reduced earnings from tanker and some marketing operations. Earnings on portfolio and short-term investments increased by $50 million to $417 million, and the interest on United States government credits rose by $100 million to $307 million. Of the direct investment total, $1.4 billion came from the Western Hemisphere, $532 million from Europe, $717 million from Africa and the Middle East, and about $300 million from the rest of the world. An industry breakdown shows that petroleum companies accounted for about $1.3 billion of the direct investment total, manufacturing accounted for $873 million, and mining for $219 million. All other industries accounted for earnings of $555 million.

Economic Analyst, Office of Business Economics, U.S. Department of Commerce.

FOREIGN MONEY VALUES. See EXCHANGE RATES.

FOREIGN POLICY OF THE UNITED STATES. Important developments affecting United States foreign policy in 1959 included the resignation of Secretary of State John Foster Dulles on April 15, 1959, because of ill health (and his subsequent death on May 24); the succession to that office by Under Secretary of State Christian Herter on April 22; and the stronger role taken by President Eisenhower in formulating foreign policy.

Although Secretary Herter declared in a television address on May 7 that there would be "no lack of continuity in our foreign policy," observers in both the United States and abroad perceived a change both in leadership and in policy. The British press commented on "the new Eisenhower," suggesting that the president was taking an initiative in foreign policymaking which had been lacking during the past years because of his sieges of illness and his great confidence in Secretary Dulles. It was also widely felt that this initiative was tending toward a less ideological and more tolerant policy—one looking toward the reduction of international tensions by efforts to create a more friendly atmosphere favorable to the conciliation of differences with the Soviet Union.

The change in the top direction of foreign policy in the spring of 1959 did not result in a dramatic shift in that policy, but did give momentum to tendencies, observable even before the death of Secretary Dulles, toward a greater effort to reduce tensions and toward less reliance on security through military preparation and alliances.

Contributing to this change in emphasis was the administration's budget-balancing policy which sought to reduce military expenditures; a serious crisis precipitated by the Soviet note of Nov. 27, 1958, suggesting modification of the status of West Berlin; and the pressure of Great Britain, under Prime Minister Harold Macmillan, for more con-

ciliatory policies toward the Soviet Union. The opposition to this British position by President Charles de Gaulle of France and Chancellor Konrad Adenauer of West Germany presented a dilemma to the United States, but President Eisenhower tended to support the British position.

The changing emphasis in United States foreign policy was manifested less by speeches of President Eisenhower and Secretary Herter than by increasing cultural and other exchanges, including an exchange of national exhibitions in New York and Moscow (see FAIRS AND EXHIBITIONS); by a series of visits among the principal statesmen on both sides of the Iron Curtain; by progress toward a summit meeting such as that which took place at Geneva in 1955; and by more positive efforts to find bases for agreement on the problems of Berlin and disarmament.

The initial reaction of the West to the Berlin crisis (the crisis was interpreted as an initiative looking toward the ultimate incorporation of West Berlin in the Soviet orbit) was the declaration of the NATO foreign ministers, meeting in Paris on Dec. 16–18, 1958, that they would "not yield to threats."

In his State of the Union message on Jan. 9, 1959, the president said his basic purpose was "to promote strength and security, side by side with liberty and opportunity." He then asked: "Can government, based upon liberty and the God-given rights of man, permanently endure when ceaselessly challenged by a dictatorship, hostile to our mode of life, and controlling an economic and military strength of great and growing power?" He justified an affirmative answer by noting "the devotion, the vision, the courage, and the fortitude of our people," and the assurance of cooperation by others because of the American nation's "position of recognized leadership in the free world." He admitted, after noting the military strength of the United States, that "possession of such capabilities helps create world suspicion and tension," although "we know that we seek only just peace for all with aggressive designs against no one." International agreements with Communist states are unreliable, he continued, unless they include "self-enforcing mechanisms." Communist disregard of their own pledges is "one of the greatest obstacles to world success in substituting the rule of law for rule by force," but we must continuously seek "a peace that rests upon justice."

The president then discussed the development of air and ground forces strength as a deterrent to aggression and general war, but warned of the necessity for "collective security agreements." There can be "no such thing," he asserted, "as 'Fortress America.'" We will not countenance aggression, as illustrated in the positions taken in Lebanon, Taiwan, and Berlin. He also emphasized the importance of economic assistance programs through both international and national institutions. The president concluded: "It is my purpose to intensify efforts . . . in seeking ways to supplement the procedures of the United Nations and other bodies . . . to the end that the rule of law may replace the rule of force in the affairs of nations. Measures . . . will be proposed later, including a re-examination of our own relation to the International Court of Justice. . . . We seek victory . . . over ignorance, poverty, disease, and human degradation wherever they may be found. We march in the noblest of causes—human freedom."

His suggestion concerning the International Court of Justice was emphasized in subsequent addresses on April 14 by Vice President Richard Nixon and on August 26 by Attorney General William Rogers, looking toward elimination of the Connally Amendment, which restricts American acceptance of the compulsory jurisdiction of that court (see INTERNATIONAL LAW).

Secretary of State Dulles reaffirmed his established views in discussions with the Senate Foreign Relations Committee on January 14. He noted that even though the world changes, there are "certain values, certain principles, that are enduring . . . individual dignity and the supremacy of moral law." He defined United States foreign policy as working for (1) "a stable world order," (2) "general acceptance of the concept of individual dignity which will lead to the spread of responsible freedom and personal liberty," and (3) "a more rapid rate of economic growth" among free nations "so that their independence will be more secure." Communist competition, he said, was becoming intensified through the economic progress in the Communist zone and economic assistance by the Soviet Union to underdeveloped countries. This increasing Soviet economic strength, along with growing military capability, presents a great immediate danger.

World order, claimed the secretary, requires elimination of the use or threat of force to accomplish international change, greater use of the International Court of Justice, and more effective use of the U.N. General Assembly to induce peaceful changes called for by new conditions. "The free world and Communist concepts," he said, "are mutually antagonistic." But some useful contacts are maintained, as in the discussions on elimination of nuclear testing and surprise attacks, on disarmament, on cultural exchanges, on high-level visits, and on the status of Berlin. Even with Communist China, discussions had been going on at Warsaw.

Progress toward a stable world could, he thought, be noted in developments toward freedom, especially in underdeveloped countries of Africa, Asia, and Latin America. He was fully aware of the demand of these nations for economic progress and the danger that if those in the uncommitted area could not get such progress in freedom through aid from the free world they would seek it by other methods and from other sources. "The cause of freedom," said the secretary, "can be won—or could be lost—in these areas." "Our purpose, ultimately and at all times," he concluded, "should be to use our great power, without abusing or presuming upon it to move steadily toward lasting peace, orderly freedom, and growing opportunity."

In his discussion before the House Committee on Foreign Affairs on January 28, Secretary Dulles commented on the opinion that "we should end the cold war." Tensions, he said, might be reduced by "forms of words," as continuously urged by the Soviet government, but "it is my deep conviction that the cold war cannot be ended in any such way." Such steps would end in "victory for international communism." The cause of the cold war, he continued, is the "creed of . . . the 'monolithic international Communist movement'" which controls the policies and resources of 900 million people. This creed, he said, is based on "atheism and materialism," seeking to force human beings into a pattern. The cold war could end, he said, either if the Soviet government abandoned its creed and its global policies, or "if the free world ceased to resist." All Soviet proposals, he thought, were designed "to diminish our will or capacity to resist international communism in the achievement of its worldwide goals."

Before the New York State Bar Association on Jan. 31, 1959, Secretary Dulles discussed three alternative programs for world peace—centralized

WIDE WORLD

President Eisenhower (center) confers at the White House with the Big Four foreign ministers on May 28, during a recess from the Geneva conference while they attended the funeral of the late Secretary of State Dulles. The diplomatic chiefs are (from left) Herter of the United States, Couve de Murville of France, Lloyd of Great Britain, and Gromyko of the Soviet Union.

world rule, as sought by the Communists; a balance of power, always precarious and tending to maintain a *status quo* likely eventually to be broken by war; and order based not on force, but on justice reflected in the application of international law and procedures of peaceful change. Since the Soviet government opposed the latter concept, it must be deterred by force. There should, said the secretary, be "more condemnation of aggression . . . in the United Nations," more intensified use of procedures of justice in the free world, and more general respect for law as the basis of stability and confidence.

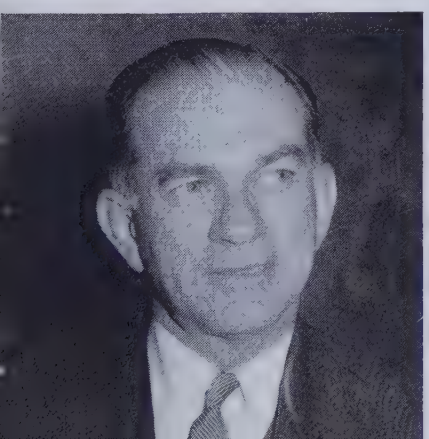
In his letter of April 15 tendering his resignation as secretary of state, Dulles said he had been brought up to believe that the United States had a "mission to help build a world where liberty and justice would prevail." Faced by the "formidable and ruthless challenge from international communism," it was "manifestly difficult to adhere steadfastly to our national idealism and national mission and at the same time avoid the awful catastrophe of war." He expressed great satisfaction in the leadership of President Eisenhower in dealing with this dilemma. President Eisenhower, in accepting the resignation, expressed warm personal regard for Dulles and deep appreciation of his able "handling of our relations with other countries" as a "staunch bulwark of our nation against the machinations of imperialistic communism."

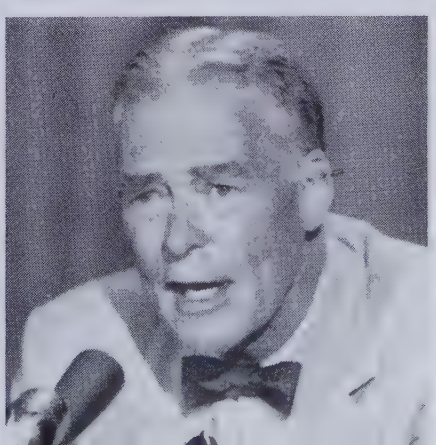
The new secretary of state, Christian Herter, attended the meeting of foreign ministers in Geneva, beginning May 11. In a televised report after his return on June 23, he said there had been "no significant progress" on the German problem, but that the conference was valuable as indicating the unity of the Western powers. In his first press conference on July 9 he was mildly hopeful of eventual agreement in further discussion at Geneva, but at his conference on October 6, shortly after Soviet Premier Khrushchev's visit to the United States, he said that although there had been "easing to some degree" of existing tensions, and the threat of force to Berlin had been withdrawn, he could see little progress toward settlement. He suggested some conditions for the possible recognition of Communist China, and said that the Soviet Union had some "responsibility for the actions of other members of the bloc."

In the meantime, a series of high-level meetings had improved the atmosphere. Soviet Deputy Premiers Anastas Mikoyan (in January) and Frol Kozlov (in June and July) visited the United States, creating a generally favorable impression and inducing Secretary Herter to characterize their visits as "useful." Prime Minister Macmillan

These three leaders in formulating United States foreign policy figured prominently in the news in 1959. Sen. J. William Fulbright (*left*) replaced Sen. Theodore Francis Green (*right*) as head of the Senate Foreign Relations Committee after the latter, at 91 the oldest man to serve in the Senate, resigned the post. Both men are Democrats. Christian A. Herter (*center*), shown at a press conference, was sworn in as secretary of state on April 21, succeeding the late John Foster Dulles.

WIDE WORLD





of Great Britain visited both Moscow and Washington in February and March, and Vice President Richard Nixon formally opened the United States Exhibition in Moscow on July 24.

President Eisenhower went to Europe in late August to have conversations with Prime Minister Macmillan, President de Gaulle, and Chancellor Adenauer. In early September he returned for discussion with Premier Khrushchev in Washington and at Camp David in Maryland. The latter meeting resulted in the president's announcement that the threat to Berlin had been withdrawn, that many of his objections to a summit meeting were removed, and that he would visit the Soviet Union in the spring of 1960. Prior to the Camp David conversations, Khrushchev had traveled widely in the United States creating varied impressions, but on the whole his visit seemed to improve the atmosphere.

In accordance with an announcement in early November, President Eisenhower on December 3 began a "mission of peace and good will" in Europe and Asia. "I hope," he said, "to promote a better understanding of America and to learn more of our friends. . . . I shall try to convey to everyone our earnestness in striving to reduce the tensions dividing mankind." He visited Pope John XXIII and the heads of government in Italy, Turkey, Pakistan, Afghanistan, India, Iran, Greece, Tunisia, Spain, and Morocco. In each country he was welcomed by large and enthusiastic crowds. His was the first visit of an American president to Asia, and in this continent particularly, it was generally agreed, he succeeded in his stated purpose. No concrete negotiations had been intended.

Before going to Spain he participated in a meeting of the heads of the four principal Western governments in Paris (December 19–21), at which it was announced that a summit meeting would be held in early 1960. Complete agreement was not, however, reached as to the positions to be taken there. Previous to the summit meeting there was to be another conference of the Western powers, President Eisenhower was to visit Premier Khrushchev in Moscow, and the latter was to visit President de Gaulle in Paris.

On his return, at the White House Christmas ceremony on December 23, President Eisenhower said that the lands he visited were united in "their friendship for America and Americans . . . ; their fervent hope . . . for betterment of themselves and of their children; and their deep-seated hunger for peace in freedom. . . . America's own best interests," he said, "require that we continue our financial investment and aid" to other nations. "Our concept of the good life for humanity does not require an inevitable conflict between peoples and systems. . . . Nor does it offer merely a bare coexistence as a satisfactory state for mankind. . . . We look and work toward a day when there can be open and peaceful partnership . . . between all peoples. . . ."

As the year 1959 moved to a close, the clouds generated by the Berlin crisis appeared less menacing and an atmosphere favorable to reduction of tensions had developed. Ambivalences still existed, however, notably in Congress, whose members had been divided on the expediency of the Khrushchev visit. On May 5 the Senate passed a resolution urging disarmament negotiations, and later both congressional and press comment acclaimed Premier Khrushchev's apparent effort in Peking, which he visited after leaving the United States, to moderate the belligerency of Mao Tse-tung, leader of Communist China.

On the other hand, on July 17 the president proclaimed Capitive Nations Week in accord with a joint congressional resolution passed shortly before. This action resulted in vigorous charges from Communist leaders that it was an incitement to revolution and interference in the domestic affairs of these countries. It was clear that President Eisenhower and Secretary Herter would not find clear sailing in their efforts to moderate the cold war.

FORESTRY. A comprehensive program for development of the national forests was presented to the U.S. Congress in March 1959 by Secretary of Agriculture Ezra Taft Benson. The program called for increased facilities and intensified management in the national forest system during the coming years to meet the needs of a growing population and expanding economy. Proposals included an increase within the next ten years of sustained annual harvest of timber from the current rate of about 8 billion board feet to 11 billion board feet; an increase in the yield of usable water through more intensive management of national forest watersheds; expanded facilities for outdoor recreation; fuller development and use of national forest grazing lands through reseeding of grasses on depleted ranges, control of poisonous plants, and other measures; improvement of food and cover on key wildlife areas; improved facilities for control of fire, insects, and diseases; an expanded system of roads and trails; and a stepped-up program of research.

Secretary Benson stated that the proposals were intended to develop the national forests in line with the program to conserve and improve the national resources of the United States, as outlined by President Eisenhower in his special message to Congress in 1953. Recommendations for financing the national forest program were to be included in the president's annual budget.

For the fiscal year ending June 30, 1960, the Forest Service of the U.S. Department of Agriculture received appropriations totaling $77,815,800 for management and protection of the national forests, $26,000,000 for national forest roads and trails, $14,026,400 for research, and $12,327,800 for federal cooperation with states and private agencies in forestry work. A supplemental appropriation approved by the Congress in July 1959 granted $7.5 million to implement the first year of the forestry program.

National Forests.—The 148 national forests, located in 39 states and Puerto Rico, had a total area of 180,508,232 acres as of June 30, 1958. Experimental forests, land-utilization projects, and related areas brought the total area administered by the U.S. Forest Service to 188,041,707 acres. During the fiscal year 1959 the national forests supplied a record timber harvest of 8,330 million board feet, an increase of 1,900 million board feet over the volume cut in the preceding year. Permits for grazing on national forest ranges were issued for some 3,720,000 cattle and sheep. The Forest Service reported a total of 68,449,500 visits to na-

tional forests for recreational purposes during the calendar year 1958, an increase of 12% over 1957 and of 275% since 1946. Returns to the U.S. Treasury in the fiscal year 1959 from the sale of timber, grazing fees, and other uses of national forest lands and land utilization project areas amounted to $124,067,682, an increase of more than $30 million over fiscal 1958.

Forest Fires.—Dry weather brought high fire danger to national forests in most of the Western states, and during the first seven months of 1959 the Forest Service reported 5,753 fires on lands inside national forest boundaries. The area burned totaled 130,657 acres during the seven-month period in 1959, compared with a five-year average of 92,763 acres for the same months. Largest acreage losses occurred in national forests of California, Arizona, and the Pacific Northwest.

Forest fire losses in 1958 were the lowest on record, according to reports from federal and state foresters compiled by the Forest Service. For all forest lands, public and private, in the United States (exclusive of Alaska), the total area burned was 3,280,000 acres in 1958, compared with an annual average since 1952 of more than 9 million acres. The number of fires reported in 1958 was 97,910, which was under the 100,000 mark for the second year.

In Alaska, 275 fires burned 314,857 acres in 1958. Most of the fires were in interior Alaska where large areas of forest land have had little or no protection. Control activities were being expanded, however, in 1959.

Tree Farms.—The total acreage of tree farms, which are part of the program sponsored by forest industries to encourage the growing of timber as a crop on private lands, passed the 49 million mark in 1959. More than 15,000 certified tree farms were reported.

The Forest Service reported that tree planting in the United States had more than doubled in five years, reaching an all-time high of 1,568,708 acres in 1959. About 86% of the year's planting was on private lands.

Canada.—The Pulp and Paper Research Institute of Canada completed its first year in its new laboratory at Pointe Claire, Quebec, near Montreal. The institute represents a three-way partnership between the Canadian government, McGill University, and the pulp and paper industry.

A forest development commission, created to study the forest resources of New Brunswick, recommended the establishment of a nonpolitical forest advisory council for the province, and long-range planning for land use to give stability to forest tenure and management.

International Forestry Developments.—Marcel Leloup of France, director of the U.N. Food and Agriculture Organization's Forestry Division since its creation in 1946, retired on Dec. 31, 1958. Egon Glesinger became the new director of the division, the name of which was changed on Jan. 1, 1959, to the Division of Forestry and Forest Products.

An organizing committee began preparations for the Fifth World Forestry Congress, to be held in 1960, with the United States government as host. The congress, scheduled for August 29 to September 10 at Seattle, Wash., will be the first held in the Western Hemisphere. Invitations were issued to more than 70 countries which are members of the Food and Agriculture Organization (FAO). Some 1,200 foreign and domestic participants were expected to attend. The last World Forestry Congress was held in Dehra Dun, India, in 1954.

During late 1959, representatives of 19 countries took part in a study tour of watershed management programs in the United States, under sponsorship of the FAO.

The School of Forestry of Hungary's Sopron University observed its 150th anniversary in 1959. The celebration took place at the University of British Columbia, Vancouver, where the staff and students, with the help of the Canadian institution, had re-established the Sopron forestry school following the Hungarian revolution of 1956. Seventy Sopron students received forestry degrees in 1959.

FRANCE. Metropolitan (continental) France has an area of 212,821 square miles, which includes various small coastal islands and the island of Corsica (3,367 square miles). The country is a member of the United Nations, the North Atlantic Treaty Organization (NATO), and various European organizations (see European Organizations). France also controls the world's second largest colonial empire, which in 1958 was reorganized under the new label "Community" (see French Community).

Population.—On March 31, 1959, the population of metropolitan France was officially estimated at 44,847,000, as compared with 42,777,174 at the census of May 10, 1954. At the time of the census there were 24 cities with populations of over 100,000. Paris, the capital, had a population of 2,820,534; Marseille, 605,577; Lyon, 462,657; Bordeaux, 250,306; Toulouse, 217,667; Nice, 208,453; Nantes, 197,915; Strasbourg, 193,353; and Lille, 190,078. In 1958 the birth rate was 18.1 per 1,000, as compared with 18.4 in 1957 and 20.7 in 1950. At the same dates the death rates were 11.2, 12.0, and 12.8, respectively. The 1958 death rate was the lowest in recent French history.

Government.—Following the bloodless revolution that began on May 13, 1958, the Fourth Republic's institutions were suspended and were shortly renovated by a hand-picked committee of experts set up by the interim premier, Gen. Charles de Gaulle (q.v.). The new constitution was ratified by popular referendum and was promulgated on Oct. 4, 1958. It preserves many aspects of the traditional parliamentary system but strengthens and stabilizes the executive branch at the expense of the legislature. The president of the republic is elected for a 7-year term by a college of 81,764 electors, which is composed for the most part of delegates of France's 38,000 municipal councils. On Jan. 8, 1959, de Gaulle was proclaimed the first president of the Fifth Republic.

Although the president's prestige and prerogatives have been considerably enhanced, the conduct of government remains in the hands of the premier and cabinet, who are jointly responsible to the lower house of Parliament, the National Assembly. The premier is appointed by the president, but he and his cabinet may be overthrown by a vote of censure adopted by an absolute majority of the assembly's membership. The powers of the assembly have been hedged about by a number of devices in the 1958 constitution. Its annual sessions have been shortened; its freedom to overthrow cabinets has been restricted; and its authority has been partially balanced by expanding the powers of the upper house, now called the Senate. Furthermore, the president's authority to dissolve the assembly and call for new elections has been somewhat reinforced.

The National Assembly is elected by universal suffrage under a system adopted by Premier de Gaulle's interim cabinet on Oct. 7, 1958. This system divides metropolitan France into small electoral districts, each of which sends one deputy to the assembly for a 5-year term. If no candidate in a district receives a clear majority of the votes cast, a runoff election is held a week later, at which time a plurality suffices to elect. This system, traditionally used in France before 1940, replaced the system of modified proportional representation in effect during the Fourth Republic. In Algeria large multimember electoral districts are provided. Voters there choose an entire list of candidates in each district, and election is by mere plurality without a runoff ballot.

The 1958 electoral law assigned 465 deputies to metropolitan France, 67 to the departments of Algeria proper, 10 to the other overseas departments, and 4 to the Saharan departments of Algeria. In addition, those overseas territories that chose during 1958 to retain their

territorial status rather than to become autonomous republics within the French Community were granted continued representation in the National Assembly (6 seats). The composition of the assembly as of July 31, 1959, was as follows:

Parties	Number of deputies
Union for the New Republic (Gaullists)	212
Independent and Peasant bloc	118
Popular Republicans (MRP)	56
Socialists	44
Republican Unity (Algerian deputies)	50
Nonparty group (organized for purposes of committee representation)	40
Communists	10
Republican Center	4
Unaffiliated	18
Total	552

The Senate consists of 307 members elected by indirect suffrage for 9-year terms, one third being chosen every 3 years. Of the total, 255 represent metropolitan France, 7 are chosen by the overseas departments, 34 by Algeria proper and the Saharan departments, and 5 by the overseas territories. The remaining 6 senators are selected by the Senate itself to represent Frenchmen residing abroad. The electoral college in each district is composed mainly of delegates from the municipal councils. The composition of the Senate on July 31, 1959, was as follows:

Parties	Number of senators
Independents	73
Democratic Left (mainly Radicals)	58
Socialists	51
Union for the New Republic	44
Popular Republicans (MRP)	34
Peasants	21
Communists	14
Unaffiliated	12
Total	307

Other central governmental organs include an advisory Economic and Social Council, which may be consulted by the cabinet; and a Constitutional Council of nine appointed experts, which rules on the constitutionality of laws and on the validity of elections. The 1958 constitution also provided for the establishment of a set of federal organs for the new French Community.

For administrative purposes, metropolitan France is divided into 90 departments, 311 arrondissements, 3,031 cantons, and 38,000 communes. Each department's administrative services are supervised by a prefect named by the Ministry of the Interior; he is assisted by an elected departmental council. Municipal services are administered by locally elected councils and by the mayors chosen by these councils. (See also below, *Principal Events, 1958.*)

French President de Gaulle passes in front of missiles on display at 23d International Aeronautical Exhibition at Le Bourget, June 13. He rejected a NATO missile base for France because of differences with the U.S. on question of control.

WIDE WORLD

Religion.—There are no official census returns on religious affiliation in France, but the country is predominantly Roman Catholic. The number of Protestants is estimated at about 1 million. There are 17 Roman Catholic archbishops and 68 bishops. Protestants of the Augsburg Confession are governed by a General Consistory, while the Reformed Church is under a Council of Administration.

Education.—Education is free in all elementary schools and obligatory for children from 6 to 14 years of age. Secondary education also is free and is open to students who can pass entrance examinations for the 7-year *lycée* course, which prepares them for the baccalaureate degree, a prerequisite for entrance to a university. In 1957–58, France had 5,100 state-operated infant schools with 724,600 pupils and 73,400 state elementary schools with 5,288,500 pupils. Enrollment in the state-operated *lycées* and *collèges* offering secondary instruction totaled 625,000. The 17 universities had 170,023 students in 1957. Private schools (most of them Roman Catholic) had enrollments as follows in 1957–58: infant schools, 24,000; elementary, 1,067,200; and secondary, 444,000. There are 5 Roman Catholic institutes (universities).

The de Gaulle cabinet, by a series of decrees issued early in January 1959, inaugurated significant reforms in the educational system. Compulsory school attendance was extended to the age of 16. An elementary cycle, with the same program for all pupils, will be provided for ages 6 to 11. An intermediate or observation cycle will follow for those aged 11 to 13. Pupils will then be channeled either to general long-term instruction in the *lycées* or to general short-term instruction terminating at age 16. Pupils may also choose to embark on vocational training at age 14. A new system of awarding scholarships is to be established in an effort to equalize educational opportunities.

Transportation and Communications.—The railways are run by the Société Nationale des Chemins de Fer Français, an autonomous corporation in which the government holds 51% of the stock. They handle 70% of the freight, and in 1958 there were approximately 26,000 miles of track, 9,600 locomotives, and 400,000 freight cars. More than two fifths of all rail traffic is powered by electricity. In 1957, France had 49,898 miles of national, 166,970 miles of departmental, and 191,228 miles of local roads. About a fourth of all goods transported in France is moved by water, and navigable waterways, including 2,855 miles of canals, totaled 4,901 miles in 1957. As of July 1, 1958, the French merchant fleet comprised 771 ships (of over 100 gross tons) with a gross tonnage of 4,158,546. French airlines flew 214,090,000 passenger-miles and carried approximately 2.5 million passengers in 1958. (See also AERONAUTICS.)

As of Jan. 1, 1957, France had 3,313,426 telephones. There were 988,600 television sets and 10,646,000 radios on Dec. 31, 1958.

Economic Conditions.—During 1958 the rate of economic expansion slowed down in comparison with the boom years of 1953–57. The gross national product (at current market prices) rose from 20,670 billion francs in 1957 to 23,467 billion in 1958, but most of this increase was inflationary. In spite of the de Gaulle government's efforts to check inflation and to stop the outflow of gold, the treasury deficit continued to increase and imports to outrun exports. France's official gold and foreign exchange reserves, which had dropped to $645 million by the end of 1957, reportedly reached the critically low figure of about $600 million early in 1958. The first budgetary estimates for 1959 indicated a potential treasury deficit twice that of 1958.

In December 1958 the de Gaulle cabinet decreed a series of drastic austerity measures designed to reduce the budgetary gap and to reinvigorate the economy. Taxes were increased to yield an estimated additional $626 million, and governmental expenditures were reduced by abolishing subsidies that totaled $345 million and by suspending most veterans' pensions. Effective December 29, the franc was devalued by 17.55%, from 420 to 493.7 francs to the U.S. dollar.[1] Quota restrictions were removed from 90% of the goods imported into France from other members of the Organization for European Economic Cooperation (OEEC), and from 56% of those from the United

[1] A new heavy franc, worth 100 old francs, was announced in December 1958, and was put in circulation on Jan. 1, 1960.

WIDE WORLD

(*Left*) Premiers Michel Debré (l.) of France and Antonio Segni of Italy enjoy stroll in Paris, where Segni had gone for talks (March 18–19) with Western leaders. (*Right*) Parisians hail Presidents Eisenhower (waving) and de Gaulle, on September 2.

States and Canada. The government promised to increase its spending for industrial expansion by 25%, and to grant small wage increases to government employees and to low-paid privately employed workers, in an effort to offset anticipated price rises. On December 31, the cabinet, still acting under its grant of emergency powers, proclaimed the 1959 budget in the form of an ordinance.The budget estimated expenditures at 6,189 billion francs and revenue at 5,602 billion. The anticipated deficit was thus slightly less than the 600 billion franc deficit anticipated in the 1958 budget.

During the early months of 1959 the new deflationary measures provoked a slight recession, which the government sought to check by twice reducing the Bank of France's discount rate (from 4½% to 4¼% on February 5, then to 4% on April 23. Antoine Pinay, minister of finance and economic affairs, publicly declared that a brief slump was unavoidable if the new liberalized system were to be given a chance to readjust. He pointed out in March that the 17% devaluation had been followed by a price rise of only about 4%, and in May he was able to announce that prices had leveled off without further rise. He added that $700 million in capital had returned to France in only a few months, that exports in April had almost balanced imports for the first time in years, and that the franc was actually stronger on the black market than on the official market. Improved tax collections brought treasury reserves up by 200 billion francs in the first half of the year. Gold and foreign exchange reserves rose from $1,050 million at the end of 1958 to $1,911 million in October 1959.

These favorable indications were offset by some continuing problems. The burden of war and economic development in Algeria showed no sign of decreasing, and foreign indebtedness now totaled about $3 billion, of which $1 billion was due for repayment within three years. There was growing pressure for wage increases, some of which were granted by individual employers despite the government's appeals. In June, a nationwide railway strike was averted only by drastic governmental action: Premier Michel Debré (q.v.) requisitioned the railway workers, thus forcing the unions to abandon the strike. In October, thousands of war veterans converged on Paris from all parts of France to demonstrate against the suspension of pensions.

Other economic reforms introduced by the government during 1959 included a decree encouraging employers to set up profit-sharing systems in their plants, a decision to authorize rent increases in order to spur housing construction and maintenance, and a bill (passed by the National Assembly on October 30) embodying the most sweeping tax reform in 40 years.

Agriculture.—Of France's economically active population, one person out of four is engaged in agriculture, which contributes about 15% to the national income. The 1958 harvest was somewhat better than that of 1957, although the wheat crop was reduced by bad weather. Wine production also continued to run below the normal figure. Production in 1958 of the chief grain crops (in thousands of bushels) was as follows: wheat, 353,000; rye, 16,930; barley, 178,750; oats, 181,670; corn, 63,960. Sugar beet output (1958–59) increased substantially, to 14,330,000 short tons, while milk production declined slightly, from 46,762 million to 46,535 million pounds. Meat production decreased slightly, to 5,456 million pounds, but continued to run well ahead of the 1951–55 average of 4,811 million. The overall index of agricultural production (prewar = 100) increased from 122 in 1956–57 to 125 in 1957–58.

Industry.—The index of employment (including salaried employees) in manufacturing (1953 = 100) dropped from an average of 107 in 1958 to 105 in June 1959. Production figures, however, tended to rise. The 1958 index of general industrial production (1953 = 100; 1957 figures in parentheses) was 153 (145); that of mining, 118 (115); manufacturing, 158 (148); gas and electricity, 157 (140); and construction, 119 (120). The production curve continued to rise, with some fluctuations, in 1959; in June the general index reached 167. Production of major industrial products in 1957 and 1958 is shown in the accompanying table.

MAJOR FRENCH INDUSTRIAL PRODUCTS

Commodity	1957 (metric tons)	1958 (metric tons)
Coal and lignite	59,088,000	60,036,000
Iron ore	57,768,000	59,460,000
Crude steel	14,100,000	14,604,000
Pig iron and ferroalloys	12,072,000	12,144,000
Aluminum	196,800	209,760
Cement	12,708,000	13,632,000
Cotton yarn	313,200	308,400
Wool yarn	153,600	134,400
Rayon filament yarn	57,840	56,280

Production of electricity rose from 57,432 mil-

lion kw.-hr. in 1957 to 61,800 million in 1958; that of natural gas increased dramatically, from 561.6 million to 1,045.2 million cubic meters. Petroleum output in metropolitan France amounted to 1,387,200 metric tons in 1958, as compared with 1,414,800 tons in 1957. Most of the output came from the Parentis field near Bordeaux.

The prospect of sizable petroleum production in southern Algeria at last began to approach reality in 1959. A 415-mile pipeline from Hassi Messaoud to the Algerian port of Bougie was inaugurated on December 5, and the French expected that in 1960 it would begin to carry about 100,000 barrels of crude oil daily. A second pipeline from the Edjelé area to La Skhira (La Cekhira), Tunisia, was scheduled for completion in mid-1960, and plans were under way for European distribution of Algerian oil through a pipeline extending from Marseille to Strasbourg, to be ready in 1962. Jacques Soustelle, minister delegate in charge of Saharan affairs, told the French Senate on July 21, 1959, that Saharan petroleum would make France self-sufficient by 1963 and an oil exporting nation soon thereafter. French refining companies were notified that they must henceforth give preference to Algerian oil. As of 1959, however, more than 90% of France's petroleum still had to be imported.

Motor vehicle production in 1958 reached an all-time high of 1,127,549 vehicles, of which 938,606 were passenger cars. The de Gaulle government's emphasis on housing construction began to show results in 1958, when 290,400 units were completed. In the first six months of 1959 the figure rose to 150,000.

Foreign Trade.—After several years of increasingly serious imbalance between exports and imports, France managed to close her trade gap in 1959. In 1957 the total value of exports had been 1,868,664 million francs, and that of imports 2,247,828 million. Considerable progress was made toward ending the deficit in 1958, when exports amounted to 2,149,610 million francs, and imports to 2,353,830 million. In the first half of 1959 exports rose to 1,286,498 million francs, while imports remained approximately steady at 1,235,603 million. For the period January–October 1959, France's trade balance showed a surplus of $410 million, as compared with a deficit of $603 million for the same period in 1958. On November 5, France removed one fourth of its remaining quota restrictions on imports from the United States, Canada, and the OEEC nations. An even more sweeping liberalization was predicted for January 1960.

France's best customers in 1958 were West Germany, Belgium-Luxembourg, the United States, the United Kingdom, and Switzerland, in that order. Its largest suppliers were West Germany, the United States, Belgium-Luxembourg, Morocco, and the United Kingdom.

On Jan. 1, 1959, in accordance with the requirements of the European Economic Community (EEC) treaty of 1957, the French government reduced by 10% its tariffs on goods imported from other EEC countries and increased its import quotas from them. In April, France and West Germany signed the first long-term agricultural trade agreement to be negotiated within the EEC. The agreement set annual quotas for the sale of French grain to Germany during 1959–62, with some increase in volume and price over those of recent years. The Saar (q.v.) was transferred from the French to the German customs area on July 6.

Principal Events, 1959.—Developments in France in 1959 were dominated by the figure of a man, President Charles de Gaulle (q.v.), and the shadow of a problem, the Algerian revolt. The seemingly insoluble Algerian crisis had produced the so-called revolution of May 13 (1958) that wrecked the Fourth Republic and brought de Gaulle to power as an interim savior. By the end of 1958, de Gaulle had supervised the construction of a new governmental system and had been elected to a 7-year term as first president of the Fifth Republic. A new National Assembly had also been chosen, on Nov. 23–30, 1958, and was heavily dominated by declared supporters of de Gaulle.

On Jan. 8, 1959, de Gaulle took the presidential oath of office and formally replaced René Coty, last president of the Fourth Republic. His first act was to designate Michel Debré (q.v.), a long-time and fervent disciple, as premier. Most of Debré's ministers were carried over from the interim cabinet that de Gaulle had headed since June 1958. The principal change was the withdrawal of three Socialist ministers, who obeyed party instructions to abandon the governing coalition. At a party congress on January 10–11, however, the Socialists pledged themselves to avoid "systematically negative" opposition to the Debré government.

Debré's cabinet was composed, therefore, of ministers drawn from his own party (the neo-Gaullist Union for the New Republic or UNR), the right-wing Independents, the Popular Republicans (MRP), the Radicals, and the higher civil service. This last category, called in France non-party technicians, had never before been given so direct a role in French political affairs. In accordance with the new constitution, those ministers who had been elected to the National Assembly had to resign their legislative seats in order to take cabinet posts. Although Debré was not required by the constitution to seek confirmation of his powers from the assembly, he appeared before it on January 15 and presented a lengthy policy statement, which on the next day was approved by a massive vote of 453 to 56.

While Debré firmly insisted on France's unshakable sovereignty in Algeria, his government took immediate steps toward clemency for the rebels. The death sentences of about 180 condemned terrorists were commuted on January 13, and plans were announced to release approximately 7,000 interned nationalists. A shift from military to civilian rule in Algeria had already begun in December, when a high civil servant, Paul Delouvrier, had been named delegate general there. Delouvrier's chief task was declared to be the application of a sweeping program of economic development, outlined by de Gaulle in a speech at Constantine on Oct. 3, 1958. This five-year plan, involving heavy public and private investment, was designed to create new industries and 400,000 new jobs, to modernize agriculture, and to provide new housing and schools. A 46-member commission appointed to work out details of the plan met in Algiers on Feb. 10, 1959, with Premier Debré in the chair. By October 1, Delouvrier was able to announce that plans had been approved for the division of 275,000 acres of farm land among Moslem families, the construction of four dams and 45,000 housing units, and the installation or expansion of 132 French firms through state subsidies.

Signs of reviving discontent appeared during the winter months both in France and among the European settlers in Algeria. The settlers attacked the policy of clemency toward terrorists and complained that neither Debré nor de Gaulle had publicly accepted their slogan of complete integration with France. An extreme right-wing group

embodying these views, the Nationalist Party, was organized in Paris on February 6, but was suppressed on February 13 as a threat to state security. On the left, the trade unions, Socialists, and Communists charged that the government's measures for financial stabilization loaded the whole burden on the workers. War veterans resented the suspension of their pensions, decreed as part of the austerity program.

This growing dissatisfaction influenced the results of the municipal elections of March 8, when new councils were chosen in France's 38,000 communes (runoff elections were held on March 15). In the 13 largest cities the Communists increased their popular vote by 19.5% over the November 1958 figure, while the UNR's total fell by 21.5%. In rural areas the swing was back toward the traditional habit of electing conservative (Independent or Radical) or nonparty candidates to local offices. The powerful Gaullist tidal wave of November 1958 was less likely to recur in municipal voting, but the tendency of the large cities to swing back toward the left was significant. On April 26, the election of the new Senate gave further evidence of a return to traditional voting patterns. The UNR again failed to repeat its striking victory of November, capturing only 27 seats in continental France; it was outstripped by the Independents, the Radicals, the Socialists, and the MRP. Among the victors were many prominent politicians of the Fourth Republic who had been beaten by Gaullists for election to the National Assembly.

The revival of the older political elite encouraged the politicians to voice their discontent at the restricted role assigned to Parliament in the Fifth Republic. A sharp controversy developed in May between Premier Debré and an important minority in the National Assembly, which demanded the right to debate and vote on statements made by cabinet ministers in answer to oral questions put by the deputies. Debré resisted this effort to re-establish some of the assembly's lost control over cabinet policy, and he was supported in this stand both by his own UNR and by the Constitutional Council inaugurated on March 5. It was clear, however, that the members of both houses of Parliament would continue to agitate for a broadening of their authority.

Another source of political conflict also began to develop in May. The issue of state financial aid to Roman Catholic schools had long divided Frenchmen. Some limited subsidies were voted by Parliament in 1951, but Catholic pressure for more generous aid continued. Many of the deputies elected in 1958 had committed themselves to such a program, and urgent appeals for action came from Catholic school organizations in 1959. Reports that the Debré government was preparing to satisfy their demands aroused the anticlerical elements of the left, which denounced Debré for allegedly yielding to clerical pressures and asserted that the state schools needed help more desperately than the church schools. On July 23, Debré sought to quiet the storm by announcing the appointment of a special commission to study the problem. In December, the government presented the National Assembly with a bill providing state aid on condition that the church schools accept limited state supervision. The bill was adopted on December 24 by a vote of 427 to 71, after the anticlerical minister of education, André Boulloche, had resigned in protest. Despite this large majority, followed by Senate approval (173–99) on December 30, left-wing hostility in the country threatened to produce serious conflict.

Algeria, meanwhile, remained in stalemate.

UPI; WIDE WORLD

***(Left)* Messali Hadj, leader of a moderate Algerian nationalist faction, listens to question during news conference at his French residence in September. *(Right)* Foreign Minister Maurice Couve de Murville, in October, said France was willing to negotiate cease-fire with Algerian rebels.**

Municipal elections held there on April 19–26 produced ambiguous results, but there seemed to be at least a slight trend away from the extremists of both camps. A few European moderates, a few Moslem moderates not only dared to run but managed to get elected. The outcome, along with de Gaulle's decision (April 7) to commute the death sentences of 30 more terrorists, aroused the diehard settler group. Fears that they might resort to violence on the anniversary of May 13 proved unfounded, but some of them began openly to repudiate de Gaulle's leadership. The president struck back sharply at his critics, who, he charged, wanted to resurrect "Papa's Algeria." On May 7, he insisted that the pacification of Algeria was close at hand, perhaps through the military successes being achieved under the Challe Plan. De Gaulle's hopes were also based on the obvious growth of war weariness in Algeria and on new signs of a turn away from the extremists. On May 31, Algeria proper elected its 32 members of the French Senate and chose moderates over extremists in almost every case.

The stalemate continued through the summer despite repeated rumors of impending negotiations through King Mohamed V of Morocco. De Gaulle made a personal tour of Algeria on August 27–30, partly to test the reactions of the army there toward a new project for ending the revolt. On September 16, his long-anticipated plan was finally announced in a radio-television address beamed to both France and Algeria. De Gaulle offered the Algerian people the right of self-determination no later than four years after the restoration of peace there. Three options, he declared, would be open to the Algerians: independence, integration with France, or a special federal relationship that would ensure internal autonomy. De Gaulle made it clear that he strongly preferred the third alternative, and that independence would in his judgment bring disaster.

De Gaulle's proposal was applauded by many Frenchmen, by the British and American governments, and by President Bourguiba of Tunisia. The Algerian rebel leadership, the National Liberation Front (FLN), issued a cautious reply on September 28. Its communiqué accepted the principle of self-determination as a substitute for its previous demand for immediate independence, and suggested the possibility of an "immediate" cease-fire if the French would agree to negotiate with the FLN as the representatives of the Algerian people. An equally cautious and indirect reply came from the French government on October 13, when Premier Debré offered the FLN leaders a

safe-conduct to come to France for discussion of a cease-fire. But the FLN's insistence on discussing the political as well as the military conditions of a cease-fire continued to be a stumbling block. On November 10, President de Gaulle appealed once more to the rebels to end the conflict.

Although de Gaulle's plan for Algeria did not require parliamentary approval, Premier Debré sought such approval from the National Assembly, where he won a majority of 441 to 23 for the government's plan on October 16. Most of the speakers during the debate had, however, denounced the concept of self-determination for Algeria, and nine UNR deputies resigned from the party to show their disapproval. Their resignation was evidently intended to spark a massive revolt within the UNR, designed to force the Debré cabinet out of office in favor of a more intransigent right-wing group claiming to speak for de Gaulle. The president's behind-the-scenes intervention headed off the coup.

The dissatisfaction of the colonial extremists showed up, however, in other ways. They resented de Gaulle's September plan for Algeria and were aroused at new terrorist attacks in Algiers. On October 15, a Gaullist deputy asserted in Parliament that professional assassins were being spirited into France via Spain with orders to kill politicians accused of betraying French Algeria. That night a prominent left-wing senator, François Mitterrand, reported that he had been pursued through Paris by a carload of armed men, who had shot up his car just after he abandoned it to seek shelter. Four days later, the Paris police conducted a series of surprise raids on the headquarters of right-wing organizations and the dwellings of extremist leaders in Paris. The government also struck at its left-wing critics and at the political activities of certain army officers. Late in October it ordered the prosecution of two leftist weeklies on charges of undermining public confidence in the army, and it scolded Marshal Alphonse Pierre Juin, highest-ranking officer in the army, for publishing an article attacking self-determination for Algeria. (See also ALGERIA.)

Meanwhile, the Mitterrand affair took a curious turn. On October 22, an obscure rightist politician, Robert Pesquet, asserted that Mitterrand had asked him to arrange a false assassination attempt in order to cast discredit on the Gaullist right. Mitterrand retorted that Pesquet had come to warn him and had tricked him into a trap. The senator, who had tried to protect Pesquet by concealing his name from the police, found himself accused of obstructing justice. On November 25, after much political bickering, the Senate voted (175–27) to strip Mitterrand of his parliamentary immunity against prosecution.

On November 28, the first formal attempt to overthrow the Debré cabinet failed in the National Assembly. Deputies of the left-wing opposition introduced a motion of censure aimed at the 1960 budget—particularly at Debré's refusal to restore cuts in veterans' pensions. The government won an overwhelming vote of confidence.

On December 2, the Malpasset Dam in southern France gave way and inundated the Reyran Valley. The dam, only five years old, had been weakened by heavy rains; 503 persons were reported dead or missing.

France and the Western Nations.—President de Gaulle's strong leadership won renewed prestige for France in 1959, but some increase in international friction was an inevitable corollary. The Debré cabinet's first policy statement on January 15, though it expressed support of western European institutions and of NATO, asserted even more strongly France's determination to assert its rights as a nation. The government was not slow in proving that it meant what it said.

On March 11 the French notified the North Atlantic Council that they were withdrawing their commitment to place one third of their Mediterranean fleet under NATO command in the event of war. Instead, the entire fleet would be kept under French command to safeguard communications with Algeria. The new policy was regarded as a product of French resentment at criticism of their Algerian policy in NATO countries, and of de Gaulle's desire for full equality with Great Britain and the United States in the NATO decision-making process. In July, the U.S. Air Force found it necessary to transfer 200 fighter bombers to bases outside France because the French government refused to permit the stockpiling of nuclear bombs. Negotiations for the installation of missile-launching sites in France reached complete deadlock. (See also NORTH ATLANTIC TREATY ORGANIZATION.)

Meanwhile, de Gaulle was moving steadily toward the consolidation of a French-led bloc in western Europe. A meeting with Chancellor Konrad Adenauer in Paris on March 4 tightened the new Franco-German rapprochement. In an official visit to Italy on June 23–28, de Gaulle reportedly advocated close Franco-Italian collaboration and the possible creation of a western Mediterranean security pact that might include Spain and Morocco as well. Out of these talks came reports that France, Italy, and West Germany might set up a joint committee to shape a common political policy for the six-nation European Economic Community (q.v.). This tendency to convert a trading organization into a political association further irked the British, who were still smarting from the breakdown in 1958 of their plan to attach a broader free trade area to the EEC. Franco-British differences on these and other matters were composed in talks by Foreign Secretary Selwyn Lloyd with French officials on November 11–12.

Further friction with the other Western powers was generated by France's insistence on pushing ahead with its program of atomic bomb production and on carrying out its plans to explode a bomb in the Sahara (see ATOMIC ENERGY), and by de Gaulle's resistance to the idea of an early summit conference with the Soviet Union. A certain relaxation of tension between France and the United States resulted from President Dwight D. Eisenhower's visit to Paris on September 2–4. De Gaulle's offer of self-determination for the Algerians also made it easier for the United States to abstain from supporting a motion critical of France's Algerian policy which failed of adoption by the U.N. General Assembly on December 12.

On October 21, it was announced that de Gaulle had invited Nikita S. Khrushchev to visit Paris, and that Khrushchev had accepted (on November 10, de Gaulle stated that the Soviet premier would arrive on March 15, 1960). France's claim to be regarded as one of the four great powers was enhanced by this move, and a summit conference was further delayed.

The widening rift within the North Atlantic alliance led Chancellor Adenauer to visit Paris on December 1–2 for talks with de Gaulle. Adenauer indicated concern that de Gaulle's unbending attitude might endanger the existence of NATO and might lead the United States to withdraw its forces from the continent. De Gaulle reassured Adenauer but contended that western Europe should look to the time when it would ensure its own defense through the development of French atomic weapons. Two weeks later, at the annual NATO minis-

terial conference in Paris (December 15–22), Franco-American differences came into the open because of the disclosure on December 12 of Gen. Nathan F. Twining's severe criticism of France's opposition to the integration of NATO military forces and its refusal to allow stockpiling of American atomic weapons on French soil. The French reacted angrily, but de Gaulle retreated slightly by suggesting that NATO seek a formula midway between integration of forces and a simple coalition. A second round of talks between President Eisenhower and de Gaulle at the Western summit conference held in Paris and Rambouillet on December 19–21 apparently accomplished little except to prevent the rift from growing worse. The French achieved a diplomatic triumph, however, when they persuaded the NATO foreign ministers to accept Paris as the site of the forthcoming summit conference in 1960.

GORDON WRIGHT,
Professor of History, Stanford University.

FRANKE, William Birrell, U.S. secretary of the Navy: b. Troy, N.Y., April 15, 1894. Nominated to the cabinet post on May 5, 1959, Franke was sworn in on June 8. He succeeded Thomas S. Gates, Jr. (q.v.), whom he had earlier followed as the department's under secretary.

Educated in Troy, Franke worked his way through New York City's Pace Institute (now College), became a certified public accountant, and after working with accountancy firms in New York and Rochester, opened his own office in New York City in 1929. This became the firm of Franke, Hannon, and Withey, from which he resigned as a senior partner on taking office as assistant secretary of the Navy in 1954. His entry into public affairs had come in 1935, when he was called on to audit the tangled finances of Louisiana State University. His subsequent service as a civilian adviser to the Army controller (1948) and as special assistant to the secretary of defense (1951–52) brought him an Army commendation for "patriotic civilian service" and the Department of Defense's Distinguished Service Award. He was named assistant secretary of the Navy for financial management in 1954 and under secretary in April 1957.

FRENCH CAMEROONS (known as **CAMEROON** after Jan. 1, 1960). Since Dec. 13, 1946, a United Nations trust territory situated on the west coast of central Africa, the territory became independent on Jan. 1, 1960. Estimated area, 166,800 square miles; pop. (1957), 3,187,621, including 16,515 nonindigenous persons, mainly French. Yaoundé (pop. 1955, 38,000) is the capital, and Douala (pop. 1957, 119,100) is the chief port. Chief ethnic groups are the Bantus, Kirdi, Foulbes, and Bamilekes.

Government.—Under a statute proclaimed in Paris on Dec. 31, 1958, the territory obtained internal autonomy, with responsibility for all matters except defense, foreign relations, and currency, until the attainment of independence on Jan. 1, 1960. Legislative power in 1959 was exercised by a 70-member Legislative Assembly elected by universal suffrage in 1956. The ministry, headed by a premier, was responsible to the assembly. Ahmadou Ahidjo, leader of the Cameroon Union Party, was approved as premier by the assembly on Feb. 20, 1958.

Education and Religion.—In the period 1946–57 there occurred a sixfold increase in school attendance. As of Jan. 1, 1958, there were 2,587 schools, with a total of 303,966 pupils (about 64% of the school-age population). School attendance exceeds 90% of the school-age population in the south, but is considerably lower in the north. Christians number about 1.7 million, mainly among the Bantus and other groups in the south; Moslems approximate 500,000, mainly among the Hamitic tribes in the north.

Finance.—The ordinary budget for 1958 totaled 10.9 billion francs CFA (revised). In the period 1948–58, French subsidies and loans amounted to 110,000 million metropolitan francs (at 1957 value) for development of transport and communications, agriculture, industry, education, and social services.

Transportation and Communications.—The railroad system comprises 2 lines (Douala-Yaoundé and Douala-Nkongsamba) aggregating 314 miles. Roads approximate 7,500 miles (of which nearly half are classified), with about 350 miles asphalted. Shipping capacity of the port of Douala, on the Gulf of Guinea, totaled 850,000 tons in 1958, over 4 times that of 1946. The chief airport, at Douala, is of international class. Passenger cars in 1958 numbered 6,980; telephones, 4,243.

Production.—The economy is chiefly one of subsistence agriculture; food crops include cassava, corn, yams, millet, rice, bananas, and peanuts. Considerable expansion has recently taken place in output of cash crops, chiefly: cocoa beans (1958–59 output, 134 million pounds); coffee (1958–59: 450,000 bags of 132 pounds each); cotton (about 22,000 tons in 1958); and bananas (about 87,000 tons in 1957). Industries, concentrated mainly about Douala, include vegetable oil, meat products, building materials, wood products, soap, and beer. The Edea aluminum plant, the territory's largest single industry, produced 31,866 metric tons of aluminum in 1958, its second year of operation.

Foreign Trade.—Exports in 1958 totaled 22,291 million francs CFA (up nearly 50% over 1957); imports, 21,452 million (up 18%). Chief exports and quantities (in metric tons) were: cocoa beans, 54,403; green coffee, 26,485; timber, 152,348; and bananas, 73,018. Imports were mainly foodstuffs, cotton textiles, petroleum products, and machinery. France purchased 62% of exports and provided 62% of imports.

Principal Events, 1959.—The French government and the native regime under Premier Ahmadou Ahidjo agreed in 1958 that the territory would attain independence on Jan. 1, 1960, and a United Nations mission which toured the territory in late 1958 recommended that the trusteeship status of the territory be terminated. At a special session of the U.N. General Assembly in early 1959, there was considerable debate over whether new elections should be held in the territory prior to independence. Elections were demanded by petitioners from the territory who charged that the Yaoundé regime was subservient to France, since the 1956 elections had been held with French troops present and after certain major parties had been banned. These petitioners were supported by the Soviet bloc, as well as several African and Asian nations. On March 13, however, the U.N. General Assembly voted to end the trusteeship agreement without prior elections, though requesting that new elections be held as soon as possible after independence.

Following the apparent cessation of terrorist activities after January 1958, a general amnesty was enacted by the Legislative Assembly on Feb. 14, 1959. However, the leftist Cameroons Peoples Union, which had been outlawed since 1955 and was alleged to be the main force behind the terrorism, remained prohibited. Terrorism broke out anew in mid-1959, when it appeared that new elections would not be held prior to independence. On June 27, six persons were killed in riots in Douala, and in the succeeding three months over 100 persons were slain in various incidents in Bamileke and Mungo provinces. On December 2, a clash between a large terrorist band and a government force at Bamendou resulted in 24 terrorists killed.

M. J. G.

FRENCH COMMUNITY. By the Constitution of the Fifth Republic, metropolitan France and the French colonial empire (called since 1946 the French Union) have been fused into a new structure officially called the Community. The voters of the overseas territories, by ratifying or rejecting the constitution in the referendum of Sept. 28, 1958, signified their intention to enter the Community or to break all formal ties with France. Only Guinea chose the latter course. In the other

territories, 9,221,585 votes were cast for participation in the Community, and only 632,606 against.

During the six months that followed, the territories were required to choose among three alternatives: (1) to become self-governing states in the Community; (2) to be fully integrated with France as overseas departments; and (3) to retain their status as partially autonomous overseas territories of the French Republic. The choice, made in each instance by the territorial legislature, was in most cases for the first alternative: 12 territories voted to become self-governing states, while 5 smaller and more isolated colonies preferred to continue as overseas territories.

THE FRENCH COMMUNITY[1]

Division	Area (sq. mi.)	Population[2]
French Republic:		
Metropolitan France	212,821	44,847,000
Algeria[3]	919,590	10,265,000
Overseas departments (outside Algeria):		
Martinique	425	267,000
Guadeloupe	687	260,000
Réunion	970	318,000
French Guiana	35,100	30,000
Overseas territories:		
Comoro Islands	838	182,000
French Somaliland	8,500	69,000
New Caledonia and dependencies	8,548	69,000
French Polynesia	1,544	79,000
St. Pierre and Miquelon	93	5,000
Territories under trusteeship:		
French Togoland[4]	22,000	1,100,000
French Cameroons[5]	168,800	3,187,000
Anglo-French condominium:		
New Hebrides	5,700	58,000
Other member states:		
Central African Republic	241,700	1,177,000
Republic of Chad	495,400	2,600,000
Republic of Congo	134,750	795,000
Republic of Dahomey	44,696	1,725,000
Gabon Republic	102,300	[421,000
Republic of Ivory Coast	124,503	3,103,000
Malgache Republic	227,800	5,184,000
Islamic Republic of Mauritania	419,229	725,000
Republic of Niger	458,993	2,800,000
Republic of Senegal	76,124	2,550,000
Soudanese Republic	464,873	4,300,000
Republic of Upper Volta	105,839	4,000,000
Total	4,281,823	91,116,000

[1] Also included in the Community as overseas territories are the Southern and Antarctic Territories, former dependencies of Madagascar, comprising Adélie Coast in Antarctica and the Crozet, Kerguelen, St. Paul, and Amsterdam islands in the southern Indian Ocean, which were given autonomous status in 1955. [2] Latest population estimates from Statistical Office of the United Nations, *Population and Vital Statistics Reports*, Statistical Papers Series A, vol. 11, no. 4 (October 1959). [3] Comprises Algeria proper and the 2 Saharan departments. [4] Scheduled to attain independence on April 27, 1960. [5] Attained independence as Cameroon on Jan. 1, 1960.

Federal Institutions.—The Community's institutional framework was gradually erected during 1959. According to the 1958 constitution, the president of the French Republic serves ex officio as president of the Community, and is assisted by three other federal agencies: an Executive Council, a Senate, and a Court of Arbitration. Charles de Gaulle assumed office as president on Jan. 8, 1959, and proceeded without delay to call the Executive Council into session. It met on February 3–4 in Paris; its membership of 25 included (in addition to de Gaulle) the French premier, the premier or president of each of the new member states, and those French cabinet ministers responsible for the Community's common affairs. At this and subsequent sessions (in all, six sessions were held in 1959), the council filled in the details of the Community's operation. The official language was declared to be French; the motto, "Liberty, Equality, Fraternity"; the anthem, the *Marseillaise;* the flag, the French tricolor with a special insignia on the shaft. Several subcommittees were set up to study the problems included in the Community's jurisdiction (foreign policy, defense, currency, common economic and financial matters, and policy on strategic raw materials).

At the council's 3d session (May 4–5) it was agreed that French economic and technical aid to other member states would be arranged through bilateral accords. The 4th session, held at Tananarive on July 7–8, heard assurances by Foreign Minister Maurice Couve de Murville that the African republics would soon be authorized to send their own representatives to the United Nations specialized agencies, and would be given some share of diplomatic representation in certain French embassies. At its 5th session (Paris, September 10–11), the council discussed the organization of common defense, the expansion of higher education in the African republics, and the development of a Community-wide investment plan.

Meanwhile, the Court of Arbitration had been established on March 7, and the Senate on July 15. The court, charged with settling disputes between member states, consists of 7 judges appointed by the president for a 6-year term; 4 of the members are French, and 3 African. The Senate comprises 284 members, 155 of whom represent metropolitan France. Members are chosen by the French Parliament or by the legislative assemblies of the other member states from among their own membership. The Senate, which meets twice a year in sessions no longer than one month, may be asked to deliberate on matters of economic and financial policy or on international agreements that affect the entire Community. Its powers are thus narrowly restricted.

Political Developments in the African Republics.—During the early months of 1959 most of the 12 new African republics adopted constitutions and held elections for new legislative assemblies. The political situation in the various states was complex and confused. New parties and leaders had been emerging in French Africa since the end of World War II, and some of these parties had begun to federate on a regional or semicontinental scale. The two strongest groups by 1958 were the African Democratic Rally (RDA), led by Félix Houphouet-Boigny of the Ivory Coast, and the African Regroupment Party (PRA), headed by Léopold Sedar Senghor of Senegal. Differences within each of these parties were about as great as those between them. Within almost every one of the African states political issues were overlaid by a complex mosaic of tribal, regional, and religious differences.

Several republics tended strongly toward the kind of single-party domination that had already come to mark such neighboring independent states as Ghana and Guinea. In the Ivory Coast, Houphouet's RDA won every seat in the 100-member Legislative Assembly in the election of April 12, 1959; no opposition candidates even entered the race. In Senegal, on March 22, Senghor's party won all 80 seats. In other republics party rivalries persisted and exploded into violence once French control was removed. At Brazzaville, in the Congo, riots on February 16–20 left more than 100 dead. The outbreak was followed by the arrest of the opposition party leader Jacques Opangault and by a sweeping victory in the elections of June 14 for the party of Premier Fulbert Youlou. In Dahomey a quite different pattern emerged: elections of April 2 produced an uneasy three-way balance of power in the Legislative Assembly.

Structure of the Community.—Two rival concepts of the future character of the Community emerged in 1959 in French Africa. The so-called federalists urged the conversion of the Community into something like the British Commonwealth of Nations. They favored early independence for each of the republics and the fusion of these states into one or more large African federations loosely linked to France. The chief spokesmen for this view, Senghor of Senegal and Modibo Keita of Soudan, fused their states into the Mali Federation in April, but without transferring all sovereignty to it. On July 5–6, they founded the Party of African Federation (PFA), replacing the PRA; it claimed to have branches in Dahomey, Niger, and Upper Volta. At the 5th session of the Executive Council in September, the Mali leaders informed de Gaulle that they intended to press for full independence.

A second faction, headed by Houphouet of the Ivory Coast and tacitly supported by the French, asserted that it would "refuse to belong to a community that was nothing more than a commonwealth." Houphouet insisted that each republic should remain intimately linked with France, whose aid would be essential for development and defense. He sought to offset the growth of Mali by

developing loose confederal ties between Ivory Coast and Dahomey, Niger, and Upper Volta.

In the most remote of the new states, the Malgache Republic (Madagascar), the ruling party of Premier Philibert Tsiranana strongly favored the preservation of an intimate tie with France. De Gaulle, during his visit to Tananarive in July, used his prestige to bolster the Tsiranana government against its ultranationalist critics, who demanded immediate independence. When Dr. Joseph Raseta, a nationalist interned in France since 1947, sought to return to Madagascar in July, he was headed off and brought back to France by French authorities.

By the end of 1959 it was clear that the leaders of the Mali Federation would not be deterred from their demand for independence, and de Gaulle felt it unwise to resist. During the 6th session of the Community's Executive Council, held at St.-Louis, Senegal, on December 11–12, he announced that negotiations would begin in January for the transfer of Senegalese and Soudanese sovereignty from Paris to Dakar, capital of the federation. Premier Tsiranana of the Malgache Republic promptly took advantage of the new mood in Paris; he announced on December 20 that the French had agreed to negotiate independence for the republic as well. A report that the Republic of Dahomey had presented a similar request was denied on December 21 by its premier, Hubert Maga.

Overseas Territories.—Only five remote and thinly populated French possessions chose in 1958 to retain their status as overseas territories, with representation in the French Parliament and with semiautonomous territorial assemblies. One, French Somaliland, was visited by de Gaulle in July 1959. He expressed France's determination to keep this foothold on the Red Sea despite the agitation of the Greater Somalia faction in favor of independence and fusion with neighboring areas.

Overseas Departments.—On Dec. 20–22, 1959, rioting in Fort-de-France, the capital of Martinique, left three persons dead and a dozen injured. Although the disorders were set off by a traffic accident that produced clashes with the police, the upheaval was in fact political in character. The Martinique Communist Party had been agitating for autonomy for the island, while an association of self-exiled French colonists from Morocco and Tunisia had been vigorously resisting the autonomist demands.

Trusteeships.—In July 1959, at its 24th session, the U.N. Trusteeship Council praised the French for preparing the independence of the trust territories of the Cameroons and Togoland, scheduled, respectively, for January 1 and April 27, 1960. Meanwhile, severe outbreaks of terrorism occurred in the Cameroons in July and August, as a consequence of tribal and political rivalries. Dr. Félix Moumie, head of an extremist party outlawed by the Cameroons government, claimed responsibility for the terrorism as a device to force new elections before the arrival of full independence. He accused Premier Ahmadou Ahidjo's government of collaborating with the French to prolong colonial rule behind a façade of false independence. Moumie's followers set off a new and bloodier wave of riots late in December, in a last futile protest against the proclamation of the independence of the new nation of Cameroon.

GORDON WRIGHT,
Professor of History, Stanford University.

FRENCH EQUATORIAL AFRICA. A former federation of four French overseas territories in west-central Africa, which ceased to exist as a political entity when the French Union was succeeded by the French Community (q.v.) and the four territories of the federation became autonomous republics of the Community. On Jan. 17, 1959, the four republics—Central African Republic, Chad, Congo, and Gabon (qq.v.)—signed a protocol in Paris for the establishment of a customs union and for the joint administration of ports, railways, river navigation, postal services, and telecommunications. The president of the Central African Republic and the premiers of Chad, Congo, and Gabon met at Brazzaville, Congo, on June 23–24. Agreement was reached on the form of the customs union and on the establishment of three joint organizations for telecommunications, transport, and mining research, to come into operation upon the formal dissolution of the French Equatorial Africa grouping on June 30.

FRENCH GUIANA. An overseas department of France, on the northern coast of South America. Estimated area (including the Inini hinterland), 35,100 square miles; pop. (est. 1958), 30,000, chiefly of mixed Indian, European, and African descent. Cayenne (13,346) is the capital. The department is ruled by a prefect and an elected General Council of 15 members. In 1956 there were 33 primary schools (4,997 pupils), 1 public secondary school (516), and 1 public technical school (140). Crops include cassava, sweet potatoes, sugarcane, rice, bananas, and manioc. Gold mining and the manufacture of rum are the chief industries. Imports in 1958 totaled 3,433 million francs; exports (mainly gold, timber, and rum), 556 million. Trade is mostly with France. National roads total 170 miles. International airlines operate scheduled flights to Cayenne.

FRENCH LITERATURE. The main events of the French literary year, beside the considerable success obtained by two imports—*Lolita,* by the American, Vladimir Nabokov, and *Docteur Jivago* (1958)[1], by the Russian, Boris Pasternak—were the death of Robert Kemp (b. 1885) and the publication of the memoirs of François Mauriac and Simone de Beauvoir.

Robert Kemp, who died on July 3, 1959, had one of the most cultured minds in France and was one of her best literary critics. Belonging to the great tradition of such critics of the 19th and 20th centuries as Brunetière, Faguet, and Thibaudet, Kemp will be easier to replace on the French Academy than in the realm of criticism.

Mauriac's *Mémoires intérieurs* is the tempestuous soliloquy of a man who, though in his middle 70's, remains a great writer at the peak of his art. An ardent Roman Catholic, Mauriac has composed a lyrical, entirely subjective piece of writing. On the other hand, Madame de Beauvoir's *Mémoires d'une jeune fille rangée* (1958) is a lucid, objective examination of a "case history." The author brilliantly recounts her own transformation from a "well-bred" young lady into an "entirely free" existentialist philosopher and writer. Her book has humor, charm, and style. The reader, however, while admiring this work on the artistic level, may find that its rationalization of the author's childhood from an existentialist and psychological point of view is not completely convincing.

Novels.—As in previous years, the novels of

[1] Unless otherwise noted, all volumes mentioned in this article were published in 1959.

EUROPEAN WORLD: FRENCH PRESS & INFORMATION SERVICE

(*Left*) Robert Kemp, who died on July 3, 1959, was one of the foremost literary critics of France. (*Center*) Simone de Beauvoir, in her memoirs, traces her growth as an existentialist. (*Right*) François Mauriac published his memoirs in 1959.

1959 were abundant and varied, with some of the best French novelists adding new titles to their bibliographies. Jules Romains contributed the third volume in his series that began with *Une femme singulière* in 1957 and *Le besoin de voir clair* in 1958. The new novel, *Mémoires de Madame Chauverel,* proved to be rather disappointing. Henri Troyat, who was elected to the French Academy in 1959[2], published *Les Compagnons du Coquelicot,* the first volume of what promises to be an ambitious, multivolume historical novel. *Les murmures de Satan* by Roman Catholic novelist Michel de Saint-Pierre calls to mind the excellence of his *Les aristocrates* (1955). Louise de Vilmorin's *Migraine* confirms her position as one of the most gifted and charming novelists writing in the classical and psychologically penetrating tradition.

The most impatiently awaited novel of the year was *Aimez-vous Brahms?* by Françoise Sagan, the 25-year-old author of *Bonjour tristesse* (1954), *Un certain sourire* (1956), and *Dans un mois, dans un an* (1957). Mlle. Sagan's new novel is the story of a 39-year-old woman who is torn between her love for two men—her lover, a man of about her own age, and a youth of 25. She returns, of course, to the older man because youth, in Sagan's novels, is always represented as a transitory state of vacillation and unhappiness. *Aimez-vous Brahms?,* a short novel built along almost classical lines, is compact, neatly written, and has a richer emotional content than its predecessors.

La Semaine Sainte is a great historical and lyrical novel by poet and novelist Louis Aragon, who, though regarded as a Marxist, does not indulge his political philosophy in this enormous, magnificent, and brilliant evocation of the week in 1815 when Napoleon returned from Elba.

The *nouveau roman,* the "new novel" of the younger generation, was represented by Nathalie Sarraute's *Le planétarium.* Like Michel Butor and Alain Robbe-Grillet, Nathalie Sarraute is an exponent of the novel in which characters, the story, and psychological character analysis do not count for much, in which the "object" is more important than the "subject" and, in the case of Mme. Sarraute, the "elementary" reactions of the individual are more worthy of analysis than human will or determination. *Le planétarium* finds its fascination, not in its characterization or in its plot, but in the camera-like technique by which the author records the "micromaelstroms" within the unconscious that push people into action.

Other interesting novels were Jacques Howlett's *Le théâtre des opérations,* Claude Simon's *L'herbe* (1958), Bernard Pingaud's *Le prisonnier* (1958), Pierre de Boisdeffre's *L'amour et l'ennui,* Claude Mauriac's *Le dîner en ville,* and Georges Simenon's *Le président* (1958).

Poetry.—In 1959 many French poets contributed new *plaquettes,* or small collections of poems, but very few of these met with unanimous critical acclaim. Among those volumes which seem to have more than a transitory interest are Monique Difrane's *Du cyprès à l'olivier* and Jean Lebrau's *Corbières.* In two very good collections, *En une seule vigne* by Jean-Claude Renard and *Dédicace d'un navire* by Robert Sabatier, the poets try successfully to rejuvenate poetic language by using as their model the source of all great poetry—the poets of ancient Greece.

Formerly, Raymond Queneau was considered to be primarily a poet, but in his new book, *Zazie dans le métro,* he has written in the genre of the novel. However, his language, lying between poetry and prose, is closer to the former than to the latter. The plot of *Zazie* (a young girl of the working class wanders from Montparnasse to Notre Dame) is secondary to its humor and the marvelous way in which Queneau satirizes such things as literature, the intelligentsia, and the oral and written language.

Theater.—French "literary" drama, which aims at pleasing the serious reader, as well as the theater-going public, was represented in 1959 mainly by Jean Anouilh's bitter play, *L'hurluberlu,* Eugene Ionesco's avant-garde *Tueur sans gages,* and Albert Camus' *Les possédés.* The Camus play, adapted from Dostoyevsky's *The Possessed,* is a real tour de force. Camus has succeeded in translating into dialogue the complexity of a great novel, ranging from satirical comedy to moving drama, from realism to stylized tragedy.

Biography and History.—André Maurois made another notable contribution to French biography with his *La vie de Sir Alexander Fleming,* an account of the modest and glorious discoverer of penicillin. In *Les impostures de l'histoire,* Emmanuel Berl disputes the offhand treatment which standard history texts accord to certain historical influences (for example, Robespierre, Tamerlaine, and the Byzantine Empire). Alphonse Juin, the only living marshal of France, published his *Mémoires,* an important study of the Algerian, Tunisian, and Italian campaigns of World War II.

Translations.—The following is a selected list of French books translated into English and published in the United States in 1959: Bruckberger, R. L., *Image of America,* tr. by C. G. Paulding and Virgilia Peterson from *La république Américaine;* Butor, Michel, *A Change of Heart,* tr. by Jean Stewart from *La modification;* Cocteau, Jean, *The Hand of a Stranger,* tr. by Alec Brown from *Journal d'un inconnu;* de Beauvoir, Simone, *Memoirs of a Dutiful Daughter,* tr. by James Kirkup from *Mémoires d'une jeune fille rangée;* Gascar, Pierre, *The Seed,* tr. by Merloyd Lawrence from *La graine;* Gide, André, *So Be It, or The Chips Are Down,* tr. by Justin O'Brien from *Ainsi soit-il, ou Les jeux sont faits;* Giono, Jean, *The Straw Man,* tr. by Phyllis Johnson from *Le bonheur fou;* Kessel, Joseph, *The Lion,* tr. by Peter Green from *Le lion;* Mauriac, François, *Questions of Precedence,* tr. by Gerard Hopkins from *Préseances;* Maurois, André, *The Life of Sir Alexander Fleming,* tr. by Gerard Hopkins from *La vie de Sir Alexander Fleming;* Rochefort, Christiane, *Warrior's Rest,* tr. by Lowell Blair from *Le repos du guerrier;* Simon, Claude, *The Wind,* tr.

[2] Other persons of literary note to be elected to the Academy during the year included playwright Marcel Achard and Dr. Jean Delay, author of *La jeunesse d'André Gide* (1957).

by Richard Howard from *Le vent;* and Troyat, Henri, *Elizabeth,* tr. by Nicolas Monjo from *La grive.*

Prizes, 1959.—The Prix Goncourt was awarded to André Schwarz-Bart for his novel, *Le dernier des justes.* The Prix Fémina was given to Bernard Privat for his novel, *Au pied du mur;* the Prix Médicis, to Claude Mauriac for his novel, *Le diner en ville;* and the Prix Théophraste-Renaudot, to Albert Palle for his novel, *L'expérience.* Antoine Blondin won the Prix Interallié for his novel, *Un singe en hiver,* and Father André Blanchet won the Grand Prix de la Critique Littéraire for his essay, *La littérature et le spirituel.*

Director of Studies,
Lycée Français de New York.

FRENCH OCEANIA. See FRENCH POLYNESIA.

FRENCH POLYNESIA (formerly FRENCH OCEANIA). A French overseas territory in the Central Pacific comprising some 125 islands in 5 main groups: (1) Society Islands (Windward and Leeward); (2) Tuamotu Archipelago; (3) Gambier Archipelago; (4) Marquesas Islands; and (5) Tubuai (Austral) Islands. Clipperton Island, 2,800 miles northwest of Tahiti, is administered as part of the territory. Total area of the territory, 1,544 square miles; pop. (est. 1958), 79,000, chiefly Polynesians, with French and Chinese minorities. The main island of the territory is Tahiti (402 sq. mi.; pop., 36,326), in the Society group. Papeete (17,247), the capital of the territory, is on Tahiti.

On Dec. 16, 1958, French Polynesia chose to retain its status as an overseas territory of France. A French governor heads the administration in the territory. The 30-member Territorial Assembly is elected every 5 years by universal suffrage. A Council of Government, chosen by the assembly, serves as the ministry. The ordinary budget for 1959 totaled 450 million francs CFP; the extraordinary budget, 73 million (the franc CFP equals 5.5 metropolitan francs). In 1958 there were 126 public and private elementary schools (16,391 pupils), and 4 secondary schools (1,128).

Sugarcane, coconuts, tropical fruits, and vegetables are grown. Industrial products include copra, sugar, and rum. Phosphates are mined on Makatéa, in the Tuamotu group. Exports in 1958 totaled 796 million francs CFP; imports, 1,006 million. Chief exports and quantities (in metric tons) were: phosphates, 309,254; copra, 17,384; vanilla, 174; and mother-of-pearl, 620. France purchased 48% of exports, and provided 44% of imports. Shipping lines and a French airline serve Papeete.

FRENCH SOMALILAND. A French overseas territory on the Gulf of Aden in northeastern Africa. Estimated area, 8,500 square miles; pop. (est. 1958), 69,000, including (in 1956) 4,360 non-indigenous persons, mainly French. The chief native groups are the Danakils and Issa Somalis. Djibouti (est. 31,000) is the capital. On Dec. 11, 1958, French Somaliland chose to retain its status as a French overseas territory. A French governor heads the administration. There is an elected 32-member Territorial Assembly, and a Government Council (ministry) chosen by the assembly. The 1959 budget totaled 1,123.3 million Djibouti francs (214.4 Djibouti francs equal U.S.$1.00). In 1958 there were 14 public schools (1,319 pupils), and 8 private (835).

The natives are chiefly shepherds and hunters. There is some cultivation of dates, tobacco, cotton, and rubber. The territory's principal economic activities involve the port operations of Djibouti. General exports (mainly naval supplies for vessels using the free port of Djibouti) totaled 2,192 Djibouti francs in 1957; imports (excluding petroleum products for re-export as bunkers), 2,189 million. Sixty-one miles of the Djibouti-Addis Ababa (Ethiopia) railway is in French Somaliland. All-weather roads total 430 miles. Djibouti has a first-class airport.

Mahmoud Harbi, a supporter of the Greater Somalia movement, was removed as premier by the French governor, following his advocacy of rejection of the new French constitution in the referendum of Sept. 28, 1958. After elections in November 1958, Hassan Gouled, favoring close ties to France, was named premier. Following Gouled's election to the French National Assembly on April 19, 1959, Ahmed Dini became premier. French President Charles de Gaulle, alluding to the Greater Somalia movement during a visit to Djibouti on July 3, declared that France would not relinquish her responsibilities in French Somaliland.

FRENCH SUDAN. See SOUDAN.

FRENCH TOGOLAND or **TOGOLAND UNDER FRENCH ADMINISTRATION.** A United Nations trust territory on the western coast of central Africa. Estimated area, 22,000 square miles; pop. (est. 1958), 1,100,000. Ewe, Mina, and other tribes predominate in the south; Hamitic groups in the north. Lomé (38,921) is the capital and chief port.

Government and Political Events.—Following a referendum in the territory in 1956, French Togoland was established as an autonomous republic of the French Union, with France retaining control of foreign relations, defense, and certain other spheres. The territory's first elections under universal suffrage took place on April 27, 1958, observed by a United Nations team. The National Unity Party, advocating complete independence, obtained 29 of the 46 seats in the Chamber of Deputies. Sylvanus Olympio, leader of the victorious party, was invested as premier on May 16, 1958. In September, Olympio and French leaders in Paris agreed that French Togoland would attain independence in 1960. On Nov. 14, 1958, the U.N. General Assembly adopted a resolution approving this course of action and stating that the trusteeship agreement would come to an end on the date of independence. On July 13, 1959, France and the Togoland government announced in the U.N. Trusteeship Council that the date for independence had been set as April 27, 1960.

Finance.—The ordinary budget for 1959 estimated revenue at 2,125 million francs CFA, and expenditure at 2,550 million (the franc CFA equals 2 metropolitan francs). France has provided the greater part of funds for development purposes.

Education and Religion.—In 1958 there were 493

Somali tribal chiefs greet President de Gaulle (wearing general's uniform) as he arrives in Djibouti, French Somaliland, on July 3. He warned leaders of a separatist movement that France would retain her interests in the territory.

WIDE WORLD

schools with a total of 72,651 pupils (44% of the school-age population). In 1959, 134 Togolese students were studying at French universities under scholarships. Togolese are mostly animists, with some Moslems among the Hamitic tribes in the north. Native Roman Catholics were reported at 145,846 in 1955; Protestants, 33,125.

Economy.—The majority of the population is engaged in the cultivation of yams, cassava, millet, sorghum, corn, beans, rice, and other food crops. Principal cash crops and exports in 1958 (in metric tons) were: cocoa beans, 6,917; green coffee, 4,562; palm kernels, 12,057; cotton, 1,748; shelled peanuts, 3,444; and copra, 2,998. Industries include the processing of agricultural products, weaving, pottery, and woodwork. Exploitation of phosphate deposits has recently begun. Other known minerals are chromite, iron ore, and bauxite. The territory's exports in 1958 totaled 3,157 million francs CFA; imports, 3,776 million. France purchased 70% of exports and supplied 47% of imports. Three short railways from Lomé total 275 miles. Roads aggregate 1,830 miles (1957). The chief airport is at Lomé.

FRENCH WEST AFRICA. A former federation of eight French overseas territories in western Africa, which ceased to exist as a political entity when the French Union was succeeded by the French Community (q.v.), and seven of the territories became autonomous republics of the Community (Guinea, the eighth, became fully independent). In early April, Senegal and Soudan became federated in the Mali Federation (q.v.). On May 29–30, leaders of Ivory Coast, Upper Volta, Niger, and Dahomey met at Abidjan, Ivory Coast, and formed the Sahel-Bénin Union, a loose association for the purpose of coordination in the spheres of customs, finance and taxation, justice, communications, public service, labor, and public health. On June 9, premiers of all seven republics (those named plus Mauritania) signed an agreement in Paris for the free circulation of goods among the signatories, the establishment of a common customs tariff on imports, and the apportionment of property and installations of the former colonial administration of French West Africa. (See articles on each of the autonomous republics, and GUINEA.)

FRENCH WEST INDIES. See GUADELOUPE; MARTINIQUE.

FRIENDS, RELIGIOUS SOCIETY OF. Friends (also known as Quakers) counted almost 200,000 members in 1959, with over 120,000 of this number in the United States and Canada.

Friends have traditionally taken an active interest in public affairs, particularly those connected with peace and social justice. In 1959, Friends' organizations joined with spokesmen from other churches in the United States in testifying against extension of the Selective Service Act. The Philadelphia Yearly Meeting in March pressed for the abolition of capital punishment in Pennsylvania and New Jersey, a measure then being considered but subsequently not passed. The requirement of a loyalty oath and a non-Communist affidavit from every recipient of a United States government school loan brought vociferous objections from many colleges and universities. Among the few colleges that refused any loans with these restrictions were three with strong Quaker ties—Swarthmore, Haverford, and Bryn Mawr.

Lewis Hoskins, for nine years executive secretary of the American Friends Service Committee, resigned his post in January 1959. Colin W. Bell, associate secretary since 1955, was named to succeed him.

The Service Committee reported that since 1945 it had shipped and distributed 25 million pounds of material aid to West Germany; during 1958 alone, 534,000 pounds of relief supplies were sent to many places of need throughout the world. New recipients of relief were the people of Lebanon, Algerian refugees in North Africa, and Tibetan refugees in India. The Committee sponsored an exchange with the Soviet Union whereby three Soviet scientists were brought to the United States in December 1958 for an extended stay. In February 1959 the committee arranged for Martin Luther King, Negro leader of Montgomery, Ala., to visit India to study Gandhi's techniques of nonviolence.

The American Friends Service Committee, the National Council of Churches, and the Southern Regional Council published a widely read report on the increase in violence and the deterioration of law enforcement in the field of minority relations in the United States since 1955.

FROZEN FOODS. Production of major frozen foods in the United States in 1957 and 1958 is shown in the following table. The pack of frozen vegetables in 1958 totaled 1,433.2 million pounds, and that of frozen fruits and berries, 610.4 million pounds.

U.S. PRODUCTION OF FROZEN VEGETABLES, FRUITS, AND FISHERY PRODUCTS

Product	1957	1958
	(In thousand pounds)	
Vegetable pack:		
Asparagus	31,201	24,365
Beans, green and wax	134,361	156,006
Beans, lima	131,380	125,910
Broccoli	80,452	109,679
Brussels sprouts	33,354	30,424
Carrots	34,237	53,713
Cauliflower	22,690	33,251
Corn, cut	112,917	111,039
Corn-on-cob	13,699	10,370
Kale	4,106	3,579
Mixed vegetables	41,547	37,297
Okra	17,070	15,767
Peas	295,823	251,934
Peas, blackeye	11,624	13,012
Peas and carrots	21,017	21,467
Potato products	219,860	269,462
Pumpkin and squash	13,151	18,007
Rhubarb	4,704	4,448
Spinach	102,130	97,472
Succotash	10,037	8,937
Turnip greens	10,873	11,041
Miscellaneous vegetables	20,332	26,064
Total vegetables	1,366,565	1,433,244
Fruit pack:		
Apples and applesauce	69,225	67,407
Apricots	8,289	6,909
Cherries	134,715	92,283
Grapes and pulp	15,510	20,355
Peaches	44,462	43,478
Prunes	1,333	3,589
Berry pack:		
Blackberries	19,157	13,604
Blueberries	24,446	15,982
Boysenberries	13,354	19,751
Currants	1,687	1,372
Gooseberries	163	968
Loganberries	1,275	1,464
Raspberries, black	15,122	13,104
Raspberries, red	30,365	24,463
Strawberries	259,262	261,529
Miscellaneous fruits and berries	33,011	24,129
Total, fruits and berries	671,374	610,387
Frozen fishery products[1]	262,228	267,789
Citrus juice pack:[2]	(In thousands gallons)	
Orange, concentrated[3]	58,631	79,911
Orange, unconcentrated	288	...
Grapefruit, concentrated[3]	3,330	4,952
Blend, concentrated[3]	507	690
Lemon, concentrated	233	...
Lemonade base	15,800	...
Tangerine, concentrated[3]	147	1,152
Limeade[4]	437	684

[1] Continental United States, including Alaska, for food purposes only. [2] Year beginning November 1; 1958 preliminary. [3] Florida pack. [4] Florida pack through Sept. 30, 1959. (Sources: fruits, berries, vegetables, concentrated lemon juice, and lemonade base, National Association of Frozen Food Packers; orange, grapefruit, and tangerine juice, and limeade, Florida Canners' Association; fishery products based on estimates of the Fish and Wildlife Service, U.S. Department of the Interior.

FRUITS. Production of fruits in the United States rose to a new high in 1959, exceeding the

1948–57 average by about 10%. The citrus crop for 1959–60 was estimated by the Agricultural Marketing Service of the U.S. Department of Agriculture at 8.39 million tons, 3% above the preceding season and 11% above the average. Production of 14 noncitrus crops, excluding strawberries, amounted to 9.82 million tons, also 3% above 1958 and 8% above average. The strawberry crop of 237,000 tons—the smallest since 1955—was 30,000 tons less than in 1958. New records were set for production of cranberries and California nectarines. Only prunes, cherries, figs, olives, and tangerines fell below average.

Bearing acreage for oranges, tangerines, grapefruit, lemons and limes in 1959 totaled 794,700 acres, close to the level of the several preceding years. Acreage for the eight major deciduous fruits (commercial apples, peaches, pears, grapes, cherries, plums, prunes, and apricots) was 1,730,100. This was 28,000 acres more than in 1958, the largest since 1955, but smaller than in any other years of the last two decades.

Consumption of fruit per person in 1959 was estimated to be close to 200 pounds (fresh equivalent basis), about the same as in other years of the past decade. Consumption of fresh fruit has been declining over the past several years, amounting to slightly over 50% of total fruit consumption in 1959, compared with 60% in 1949. Consumption per person of canned fruit and of frozen fruits and juices has risen steadily, with the former 20% above the 1947–49 average and the latter up 180%. Use of canned juice has fallen 30% per person since 1947–49 as the frozen products gained in popularity. Use of dried fruit in 1959 was 10% below average.

Apples.—Although the 1959 commercial crop of 118,227,000 bushels was 7% smaller than that of 1958, it was 9% above the 1948–57 average, and the third largest of the 1950's. About 1,560,000 bushels were left unharvested for economic reasons, slightly more than in either of the preceding two years. Production of winter varieties was estimated at 100,800,000 bushels, 8% below 1958. The crop of fall varieties was 12,500,000 bushels, slightly above 1958, while summer varieties totaled nearly 5 million bushels, the same as the year before.

U.S. PRODUCTION OF APPLES, PEARS, AND PEACHES BY LEADING STATES
(1,000 bushels)

	Average 1948–57	1958	1959

Colorado	1,682	1,820	1,850
Virginia	1,315	1,950	1,500

* Estimates refer to the total production of apples in the commercial apple areas of each state. (Source: Agricultural Marketing Service, U.S. Department of Agriculture.)

Peaches.—Production in 1959 rose 20% above average to 73,806,000 bushels, 4% more than in 1958. The increase came in the California clingstone crop, which totaled 25,400,000 bushels, 20% more than in 1958 and the second largest crop of record. (Clingstones are used mostly for canning.) Production of other peaches amounted to 48,400,000 bushels, slightly below 1958.

Pears.—The total of 31,090,000 bushels in 1959 was 8% more than in 1958 and 5% more than average. The three Pacific coast states produced 27,500,000 bushels, 12% more than in 1958. This included 20,900,000 bushels of Bartletts, which usually account for nine tenths of the pears processed.

Grapes.—The third largest crop on record—3,228,350 tons—was produced in 1959. California accounted for 2,950,000 tons, including 1,834,000 tons of raisin varieties, 590,000 tons of wine varieties and 526,000 tons of table varieties. Raisin production increased sharply to 243,000 tons, 57,000 tons above 1958 and 26,400 tons more than average.

Plums and Prunes.—The 1959 plum crop of 105,400 tons was 53% above 1958, and was the second largest on record. About 3,000 tons of the California crop were dumped because of size restrictions under marketing orders. Prune production also increased sharply over 1958, but the 431,350 ton total (fresh basis) was still 46,300 tons below average.

Cherries.—The sweet cherry crop totaled 80,090 tons in 1959, 9% below 1958 and 14% below average. However, the sour crop of 134,530 tons exceeded 1958 by 29% and the average by 3%.

Cranberries.—The 1959 crop rose 7% from 1958 to 1,252,000 barrels in 1959, a new record. (See also Massachusetts; Oregon.)

Apricots.—Production in 1959 more than doubled the short 1958 crop. The 229,800-ton total was 10% above average.

Avocados.—The 1959–60 crop set a new record of 73,300 tons, 40% greater than in 1958–59.

Dates.—The 1959 crop of 22,900 tons in California was 17% above 1958. Larger crops were produced only in 1955 and 1957.

Figs.—California's production of dried figs in 1959 was 19,000 tons (dried basis), 18% less than in 1958 and 28% below average. Production of figs for other uses was the smallest since 1933—6,600 tons (fresh basis).

Olives.—Production dropped sharply in 1959. California's 26,000 ton crop was only slightly more than a third of the 1958 crop, and was 45% below average. It was the smallest since 1939.

Nectarines.—A 26% increase over 1958 raised the 1959 crop in California to 43,000 tons, a new record.

Strawberries.—The 1959 crop fell 11% below 1958 to 474,745,000 pounds, but was 9% above average. Slightly over half the crop—238,201,000 pounds—was for processing.

Citrus Fruit. *United States Crop.*—Production continued to rise in 1959–60, with only grapefruit and tangerines below the preceding year, and only tangerines below average. Estimates of the Agricultural Marketing Service in December 1959 placed the orange crop at 132,895,000 boxes, 7% more than in 1958–59 and 12% more than average. The crop included 68,445,000 boxes of early, midsea-

son, and navel varieties and 64,450,000 boxes of Valencias. Florida's tangerine production amounted to 4,000,000 boxes, and fell short of both the 1958–59 crop and the average crop by 500,000 bushels.

*Preliminary, based on conditions as of Dec. 1, 1959. Season begins with the bloom of the year shown and ends with completion of harvest the following year. (Source: Agricultural Marketing Service, U.S. Department of Agriculture.)

Grapefruit production in 1959–60 was estimated at 43,100,000 boxes, slightly less than in the preceding year and a little above average. Lemon production continued to increase, reaching 18,900,000 boxes, compared with 17,340,000 boxes in 1958–59 and with the average of 13,669,000. Lime production rose sharply over 1958–59, but the 300,000-box crop remained below average. The tangelo crop totaled 450,000 boxes, about 150,000 more than in the preceding year.

World Citrus Production.—Production in 1958–59 increased in all major citrus areas. Orange production rose to 377,220,000 boxes, 39,244,000 more than in the preceding year. The Foreign Agricultural Service of the U.S. Department of Agriculture reported that orange production in the Mediterranean area reached a record and that further increases occurred in Argentina and Brazil. New plantings in the Mediterranean, South America, South Africa, and the United States indicate future production increases. Spain's crop of 44,720,000 boxes of oranges was second only to that of the United States. Japan was third, with 26,790,000; and Italy fourth, with 26,770,000.

WORLD PRODUCTION OF CITRUS FRUITS
(1,000 boxes)

Fruit	Average 1950–54	1957	1958[1]
Oranges and tangerines	325,237	337,976	377,220
Lemons	30,648	35,942	39,350
Grapefruit	47,314	45,185	49,080
Limes[2]	3,328	3,770	3,670

[1] Preliminary. [2] Mexico, United States and Egypt only. Harvest in Northern Hemisphere begins in November of year shown; in Southern Hemisphere, in May of following year. Production in foreign countries converted to boxes of following weights: oranges, 70 pounds; grapefruit and limes, 80 pounds; lemons, 76 pounds. (Source: Foreign Agricultural Service, U.S. Department of Agriculture.)

Increased production in the Mediterranean region accounted for most of the rise in world lemon production (from 35,942,000 boxes in 1957–58 to 39,350,000 in 1958–59). Italy produced 11,600,000 boxes to lead all nations other than the United States. Grapefruit production, dominated by the United States, also increased in 1958–59. Israel's crop of 1,720,000 boxes was second only to that of the United States. Most of the world's limes are produced in Mexico and Egypt. The 1958–59 Mexican crop was 2,370,000 boxes; and the Egyptian crop, 1,100,000 boxes.

U.S. Foreign Trade.—The value of fruits and fruit preparations exported from the United States in the 1958–59 fiscal year was $228,939,000, down 13% from the preceding year. As usual, oranges exceeded any other item, amounting to $36,425,000 in 1958–59. Imports of fruits and fruit preparations increased 10% over 1957–58, to a value of $148,457,000. Bananas ($73,035,000) accounted for about half of the 1958–59 imports.

FUR INDUSTRY. The years 1958 and 1959 have seen a far-reaching change in consumer attitudes toward furs. Public interest in fur garments, which had fallen to a very low level in the years preceding this period, suddenly came to life. Simultaneously the promotional activities within the industry were greatly increased.

The net result has been a dissipation of the lethargy which existed in the industry and a creative outburst of new designs in fur wearing apparel, trimmings, and incidental accessories. Skin types long neglected have been resurrected, and even though mink is still most in demand, many other furs—such as beaver, muskrat, persian lamb, squirrel, fox, wolf, raccoon, and lynx—have been produced in new designs, colors, and fashion concepts.

The Fur Information & Fashion Council, Inc. has retained a number of widely known fashion designers who have produced patterns for an outstanding assortment of fur garments known as the "Young Designers' Group." These garments were made available to outstanding retail establishments throughout the United States and were very favorably received. Special appeals were directed to youth groups such as campus teenagers and to professional women, clubwomen, and young matrons in a nationwide campaign.

Fur trimmings are again in widespread use, not only on coats and suits but also on dresses and sweaters, the latter having become a national favorite.

The result of all this activity has been a virtual end to unemployment in the industry and a high level of industrial peace. There were 1,509 fur manufacturing establishments in operation during 1959, employing some 21,700 persons. During the fiscal year ended June 30, 1958, the federal government collected excise taxes amounting to $28,544,000. Retail fur sales in 1958 totaled approximately $282,840,000. United States fur and fur manufacture exports in 1958 were valued at $36 million; imports, at $88 million.

Associated Fur Manufacturers, Inc.

FURNITURE INDUSTRY. Production.—As 1960 approached, furniture manufacturers and retailers were pleased to find that the value of production was at the rate of $2,666 million, reversing a

downward trend for the previous two years and topping the record set in 1956. For the first seven months of 1959, shipments of household furniture by some 3,000 companies with about 6,000 factories were 15% ahead of those in the same period in 1958; orders were 21% ahead for the first eight months. The industry did not expect to maintain this pace for the remainder of the year, however, since figures for these months would be compared with those of a period that saw the beginning of recovery.

In August 1959, 276,500 plant employees worked an average of 42½ hours, compared with 40 hours a year earlier. In June 1959, weekly wages averaged $70.30. The increase in production failed to produce a proportionate increase in employment due to some increased mechanization. In defense against rising costs, more plants were turning to mechanization wherever possible. But the industry had a long way to go to achieve maximum production efficiency. The industry was still primarily one of small companies; only about 15% have annual sales of more than $1 million.

Profits.—Since 1946, when profits after taxes were 7%, returns have declined. In 1958, profits were 2.3% after taxes, compared with 4.1% for all manufacturing corporations. Despite the industrywide slump, a substantial number (31%) of firms increased their earnings over 1957 levels. The return on capital investment was 5.53% after taxes in 1958. For every $100 of net sales in 1958 there was $43.23 of investment capital.

Prices.—In July 1959 the wholesale price index for household furniture (1947–49 = 100) stood at 124.3, up 1.1% from the previous July. The consumer price index (same base) stood at 107.2 in June, up 0.5% from June 1958.

Overproduction and intense competition have tended to keep prices stable. In a comparison of prices between March 1948 and 1959, furniture prices increased only 3.1%, while those of automobiles increased 41%, according to the National Association of Furniture Manufacturers.

Furniture Store Sales.—In 1959, sales in more than 25,000 furniture stores made a strong comeback after being hurt by the 1958 recession. For the first eight months, sales totaled $3,296 million, an increase of 8% over the total in the corresponding period of 1958. In the same 1959 period furniture wholesalers had sales of $530 million, compared with $485 million in the first eight months of 1958. Furniture stores account for about 60% of all sales; department stores, 10%; and wholesalers, 10%. The remainder is distributed through variety stores, mail order houses, and other sources.

Exports and imports continued in 1959 to account for only about 0.5% of total American production.

In 1958, business failures included 272 furniture manufacturing companies and 124 furniture and furnishings stores per each 10,000. The 1,041 stores which failed in 1958 had liabilities of $45,098,000.

In 1957, 1.2% of disposable income in the United States was spent on furniture, a slight decline from the previous year. Between 1948 and 1957 the industry lost one seventh of its market in terms of disposable income. To counteract this trend, efforts were made to establish an industrywide promotion campaign. After one year of study the program was dropped because of the failure of important segments of the industry to agree on a method of financing the campaign.

(For discussion of style trends, see INTERIOR DECORATION.)

FURS. See FUR INDUSTRY.

GABON. The Gabon Republic is an autonomous republic of the French Community (q.v.), situated on the west coast of central Africa. Estimated area, 102,300 square miles; pop. (est. mid-1958), 410,000, including (in 1956) 3,984 nonindigenous persons, mainly French. French is the official language. Chief towns are Libreville, the capital (est. pop., 19,657), and Port-Gentil (16,645); both are seaports.

Government.—Formerly a French overseas territory included within the federation of French Equatorial Africa (q.v.), Gabon chose the status of a member state of the French Community on Nov. 28, 1958. As an autonomous republic, Gabon has self-rule in domestic affairs, with the Community exercising control of foreign relations, defense, currency, strategic minerals, and certain other matters. Gabon adopted its constitution on Feb. 19, 1959. The Legislative Assembly consists of 40 members elected for a five-year term by universal suffrage. The premier is chosen by a majority of the assembly. Léon M'Ba, leader of the Gabon Democratic Bloc (local branch of the pro-French African Democratic Rally), is premier.

Education and Religion.—In 1958 there were 321 schools with a total of 40,919 pupils (66.8% of the school-age population). Government expenditure on education amounted to 571.1 million metropolitan francs, or 19.6% of the budget. Many of the natives in the coastal area are Christians, although animism prevails among the tribes of the interior.

Transportation.—Gabon has no railroads. The Ogooué River affords an important means of inland transport. Roads and trails total about 3,195 miles (1956), including 191 miles of hard surfaced roads and 2,399 of all-weather trails. The chief airports are at Libreville and Port-Gentil.

Production.—Gabon's dense tropical forests render her an important producer of *okoumé*, mahogany, and ebony; and logs, plywoods, and veneers form the bulk of the republic's exports. Cocoa beans are also grown for export, and wild rubber, kapok, waxes, and kola nuts are gathered by the natives. Subsistence crops include manioc, sweet potatoes, corn, and plantains. Output of petroleum, the chief mineral, totaled 504,800 metric tons in 1958, nearly three times that of 1957. Deposits of gold and diamonds are worked on a small scale, but the republic's large reserves of iron ore, manganese ore, and uranium are as yet largely untouched.

Foreign Trade.—Exports in 1958 totaled 16.8 billion metropolitan francs; imports, 15.5 billion. Chief exports were lumber (632,000 metric tons), petroleum, cocoa beans, and gold. France is the republic's chief trading partner.

Principal Events, 1959.—On June 30, 1959, the International Bank for Reconstruction and Development extended a loan equivalent to $35 million to the Compagnie Minière de l'Ogooué (COMILOG) for the development of the high-grade manganese ore deposits near Franceville. Construction of production and transport facilities are to be completed in three years, with the first shipments scheduled for mid-1962. The United States Steel Corporation holds a 49% interest in COMILOG, which is incorporated in Gabon.

GALAPAGOS ISLANDS. A group of islands in the Pacific Ocean about 650 miles off the coast of Ecuador, forming a province of Ecuador. Area, 3,123 square miles; pop. (1957), 1,687. San Cristóbal (195 sq.mi.) is the main island and contains about half the total population. Sugarcane, coffee, and yucca are grown, and there is some fishing and cattle raising. Noted for their unique fauna, the Galápagos Islands were made a national park and wildlife refuge by the Ecuadorean government on July 16, 1959.

GAMES. See Sports, Games, and Shows.

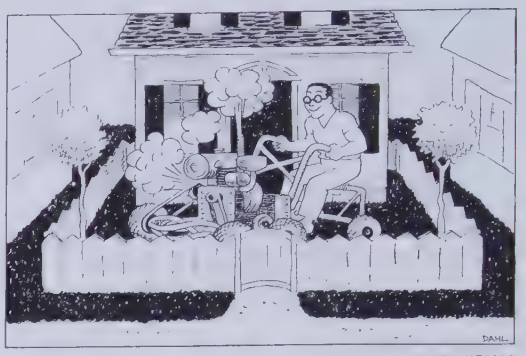
GARDENING. The tremendous interest in gardening in the United States is reflected in the large number of horticultural organizations with a total membership which runs into several millions. Experimental stations, extension services, and horticultural organizations report a greater number of requests for gardening information than ever before.

Trends in Home Gardening.—Whereas fifty years ago one out of every five workers owned his home, today three out of five workers are home owners. For every dollar the worker spent on recreation in 1900, he now spends $20. Better pay and shorter working hours, coupled with increased home ownership, have combined to make home gardening the number one hobby in the United States. In 1959 home gardeners paid an estimated $3,216,000,000 for seeds, nursery stock, garden hardware, fertilizers, insecticides, fungicides, and related supplies. Sales of grass, flower, and vegetable seeds alone were estimated at $400,000,000.

The home market for flowers, ornamentals, garden supplies, and equipment continues to grow with the expansion of home building in the suburbs. Home building in 1959 was well over that of 1958, topped only by the peak year of 1950. Record high employment and income in 1959 also contributed to an increase in sales of over $2 million in the garden lines and associated fields.

Tulip-bordered walk forms one of the many International Flower Show exhibits at the New York Coliseum in March.

EWING GALLOWAY



DAHL IN THE BOSTON HERALD

"In the Suburbs"

The retail volume of seed packets sold in 1959 was up 5% to 10% over that for 1958. Flower seed sales for the home garden have increased steadily, and greatly improved varieties are now available, due largely to the influence of All-America Selections. With the increasing proportion of smaller homes, however, the trend has been away from the home vegetable garden.

The Garden Supply Industry.—In the past ten years the garden supply business has increased tenfold and has seen a revolution in retail selling methods. To share in this greatly expanding business, new retail sales outlets have appeared in many areas. Most of the old downtown seed stores in the high-rent areas not easily accessible have gone out of business or have moved and expanded their lines to better serve the suburban market. At the same time, department stores, grocery stores and supermarkets, hardware stores, and drugstores have made gardening products readily available to the consumer.

There has been fantastic growth in the number of modern garden centers—the one-stop store conveniently located and featuring all types of garden supplies, nursery stock, and gardening equipment. Nurserymen have been foremost in building these centers, and both the nurserymen and seed associations are fast becoming interested in the garden center operator.

A survey made by the University of Oregon showed that for every dollar's worth of nursery stock sold, $4 worth of fertilizer, tools, insecticides, etc. was purchased. It has been estimated that 15 million power lawnmowers were in use in the United States in 1959.

The quality of grass seed has been improved considerably, and sales have doubled since 1950. In 1959 about 15 million pounds were used to beautify grounds of new homes, while about five times that amount was used for reseeding and restoring old lawns. The demand for nursery stock also has doubled since 1950. In 1959 some 45 million home gardeners purchased $775 million worth of nursery stock from some 12,000 nurserymen—an increase of 5% in sales over 1958.

A shortage of good labor, greatly increased cost of tools and other materials, and the inability to raise prices plagued nurserymen in 1959. Improved techniques provided a partial answer to these problems. The raising of nursery stock in containers to facilitate transplanting, the development of new methods of transporting field-grown plants, and the packaging of root-wrapped stock, designed specifically for retailing through garden centers, department stores, etc. have all cut down on labor costs.

Industrial Landscaping.—Five years ago United States industry spent less than $40 million a year on trees, shrubs,

and flowers to beautify its premises. In 1959 it spent four times that amount. To promote employee morale, and to break down local resistance to industrial plants in residential suburbs, more and more companies are turning to landscape architects whose fine landscaping distinguishes the new suburban plants from the earlier in-town establishments.

Miscellaneous.—More than $20 million a year is currently being spent on research in development of insecticides. In North America alone, entomologists have identified about 82,500 kinds of insects of which they roughly classify 10,000 as public enemies. A new family of microbial insecticides has been developed which kill through quick-acting infection of the insect, yet which are not harmful to humans or pets.

The use of mulches has increased sharply in recent years. An all-organic multipurpose mulch said to aid plant growth by storing water, maintaining soil temperatures, adding humus, and increasing aeration is on the market. Now receiving considerable attention also are new compounds used to reduce growth as well as to increase flowering.

GAS, Natural and Manufactured. Output data for the major producers of the world, shown in the accompanying table, have been taken from the records of the *Monthly Bulletin of Statistics* of the United Nations. (World production figures cannot be completely compiled because data are reported by only a few of the leading producing countries.)

MAJOR PRODUCERS OF NATURAL GAS[1]
(In billions of cubic feet)

Country	1955	1956	1957	1958
Brunei[2]	41.6	50.4	56.7	56.6
Canada	150.9	169.1	206.4	338.2
France	9.4	11.3	19.8	36.9
Hungary[2]	19.2	16.0	14.5	13.3
Indonesia[2]	67.4	72.0	76.7	73.7
Italy	128.0	157.6	176.3	183.1
Mexico[2]	122.9	128.8	164.0	264.0
Trinidad	17.6	19.3	21.2	23.4
United States[3]	6,107.8	6,731.2	7,233.8	7,441.5
Venezuela	97.0	105.9	128.0	139.0

[1] Excluding gas used for repressuring, as well as gas flared, vented, or otherwise wasted. [2] Including gas for repressuring and gas wasted. [3] Gas sold by public utilities, representing 52% to 59% of total production.

The following data are based on figures compiled by the U.S. Bureau of Mines and supplied by the American Gas Association. The marketed production (gross production minus the quantities consumed in repressuring, venting, and wasting) of natural gas in the United States was 11,030,248 million cubic feet in 1958, compared with 10,680,000 million cubic feet in 1957, a gain of 3%. In the first half of 1959, marketed output was 5,671,570 million cubic feet, compared with 5,449,900 million in the comparable period of 1958.

In 1958, Maine and New Hampshire were the only states in which natural gas was not consumed. Consumption of natural gas in the United States in 1958 by classes was as follows: residential, 2,714,251 million cubic feet (up 9% over 1957); commercial, 871,774 million cubic feet (up 12%); field use, 1,604,104 million cubic feet (up 8%); industrial fuel, 5,359,471 million cubic feet (up 2%); and carbon black, 211,048 million cubic feet (down 10%). A large quantity of natural gas was also used as fuel at electric utility plants.

MAJOR PRODUCERS OF MANUFACTURED GAS
(In millions of cubic feet)

Country	1955	1956	1957	1958
Australia[1]	43,479	44,581	46,657	47,632
Austria[1,2]	12,205	13,476	13,010	11,442
Belgium	72,889	79,246	78,398	79,669
Canada[3]	18,900	20,044	15,934	5,721
Czechoslovakia	119,928	125,437	129,251	127,556
Denmark	13,688	13,942	13,518	13,349
France[4]	88,145	91,959	99,587	102,129
Saar	58,057	62,295	64,837	62,718
Germany, East	86,874	95,773	97,468	108,486
Germany, West	737,789	796,694	817,459	794,151
Italy	75,432	79,669	83,483	74,160
Japan[1]	83,060	98,315	109,757	111,876
Netherlands	70,770	75,432	76,703	81,364
Spain[1]	11,188	11,823	12,374	12,798
United Kingdom	600,911	604,725	586,079	590,740
United States[5]	460,218	396,228	300,032	310,202

[1] Excluding gas from cokeries. [2] Vienna only. [3] Sales (in 1957 about 21% of total production). [4] Sales (in 1957 about 38% of total production). [5] Public utilities sales of manufactured and mixed gas according to American Gas Association (in 1957 about 27% of total production).

The Bureau of Mines reported that the average wellhead value of natural gas was 11.9 cents per thousand cubic feet in 1958, or 0.6 cents higher than in 1957. The average value, at point of consumption, increased from 43.1 cents per thousand to 46.2 cents in 1958. Gross injections to underground storage in 1958 were 704 billion cubic feet; withdrawals were 621 billion cubic feet, an increase of 83 billion. Texas, Louisiana, New Mexico, Oklahoma, Kansas, and California were the principal producing states.

Interstate shipments, including exports, increased 6% in 1958, and accounted for 59% of marketed production. Exports of gas totaled 38,719 million cubic feet, of which 32,129 million went to Canada and 6,590 million went to Mexico. Imports in 1958 increased to 136 billion cubic feet, 90 billion of which was received from Canada and 46 billion from Mexico.

GASOLINE. See Index entry.

GATES, Thomas Sovereign, Jr., U.S. secretary of defense: b. Germantown, Pa., April 10, 1906. After serving as under secretary of the Navy (1953–57), secretary of the Navy (1957–59), and deputy secretary of defense (1959), he was sworn in as secretary of defense on Dec. 2, 1959, succeeding Neil H. McElroy.

Gates was graduated from the University of Pennsylvania in 1928 and immediately entered the Philadelphia investment banking firm of Drexel & Company, becoming a partner in 1940. (His father had been a Drexel partner from 1918 to 1930, as well as president of the University of Pennsylvania, from 1930 to 1944.)

A member of the U.S. Naval Reserve from 1935, Gates went on active duty as a staff officer during World War II, serving with both the Atlantic and Pacific fleets, and rising to the rank of commander. After the war he was prominent in Naval Reserve activities and served as an adviser to the Navy Department. In 1953 President Eisenhower

named him under secretary of the Navy and, in 1957, secretary.

Gates resigned from the latter post on Feb. 3, 1959, effective June 1. At the time, a Navy publication reported that he had been "unhappy with the Defense Department reorganization." On May 18 the president appointed him deputy secretary of defense, to succeed Donald A. Quarles (q.v.), who died on May 8.

Gates accompanied President Eisenhower to Europe in August for the meetings of Western leaders prior to Soviet Premier Khrushchev's visit to the United States. On December 1, at the time of Secretary McElroy's long-deferred resignation as Defense Department head, Gates was named to fill the post.

GEM STONES. The United States is a substantial market for diamonds and other precious stones, although its production is trivial. In 1958, imports of gem stones into the United States totaled $165,807,000 compared with $168,664,000 in 1957. The imports in 1958 were chiefly diamonds, including 1,129,297 carats of rough and uncut stones valued at $72,430,000 and 718,422 carats of cut (unset) diamonds valued at $68,065,000. The data do not include industrial diamonds (see ABRASIVES). Other imports included cut emeralds, natural and cultured pearls (especially the latter), real and imitation marcasites, and many others.

World sales of gem diamonds in 1958 totaled 5.2 million carats valued at about $140 million, compared with 5.5 million carats valued at $148 million in 1957. In the United States, production of diamonds in Arkansas was reported at 475 carats valued at over $5,000. Three smoky colored diamonds were recovered from a mud pipe in Nevada, and a claim was filed on the deposit.

In the United States, 41 states produced a wide variety of semiprecious and ornamental gem stones in 1958. For the first time the estimated annual value of gem material produced was more than $1 million. Ten western states produced 87% of the total value, with Oregon leading in output. Jade production was valued at $60,000, a 20% increase over 1957. Alaska was the chief producing state for jade, followed by Wyoming, California, and Colorado. (See also JEWELRY; MINERAL PRODUCTION.)

GENERAL ASSEMBLY, U.N. See UNITED NATIONS.

GENETICS. In mammals and many other animals the sex chromosomes consist of two X chromosomes in the female and an X and Y chromosome in the male. For many years it has been known that in the fruit fly *Drosophila,* sex is determined by the balance between female-determining factors on the X chromosomes and male-determining factors on the autosomes. The Y chromosome plays little if any part in sex determination and is equivalent only to the absence of an X chromosome. No evidence on the mechanism of sex determination has been available in mammals. In the last year, however, it has been shown in both man and the mouse that the Y chromosome is not inert but is the bearer of male-determining factors. It is possible that this mechanism may operate in all mammals.

The evidence in man for the above conclusion came from examination of the chromosomes of two types of intersexes. One of these, predominantly female, was shown to have one X and no Y chromosome, and the other, predominantly male, was shown to have two X's and a Y. Such unequivocal enumeration of mammalian chromosomes has become possible in the last few years because of the development of new techniques which separate the chromosomes sufficiently to allow accurate counting. The same techniques have led to the solution of a long-standing puzzle in medical genetics: the cause of Mongolian idiocy. The distribution of this trait was not explainable by any of the usual genetic or nongenetic mechanisms. It has now been shown that Mongoloids possess an extra member of one of the smallest pairs of chromosomes. This is the first such case to be described in mammals and may lead to an explanation of other cases with similar anomalous distributions.

Classical experiments on the effect of ionizing radiations on the mutation rate in spermatozoa of *Drosophila* have shown that the frequency of mutations is independent of dose rate. In experiments recently reported from the Oak Ridge National Laboratory it has been shown that in mature spermatozoa of mice, the mutation rate is also independent of dose rate, but that in earlier stages of germ cell formation in both males and females the mutation rate at low radiation intensities is much less than at high intensities for the same total dose. If the same should also be true in man, it would mean that small doses of irradiation over long periods of time would be less dangerous from a genetic point of view than the same total dose administered at one time.

Continuing studies on the enzymatic synthesis of deoxyribonucleic acid (DNA) have demonstrated clearly the importance of the primer DNA in determining the composition of the synthesized DNA. The ratio of adenine-thymine to guanine-cytosine base pairs in the synthesized DNA corresponds closely to that of the primer regardless of the relative concentration of substrates in the reaction mixture. This supports the hypothesis that DNA acts as a template for its own synthesis. Further evidence has been supplied that at the time of synthesis of a new molecule, the two strands of the double-stranded DNA molecule separate with each strand serving as a template for the synthesis of its complement. Recent experiments using heavy nitrogen (N^{15}) to label the original molecule have implied that the labeled strands separate at the time of replication, since they retain their integrity through many subsequent generations of molecules.

The two strands of a DNA molecule are linked together by base pairs, and the genetic information carried by the molecule is thought to be determined by its particular sequence of base pairs. A gene mutation may therefore consist of a change in this sequence. Since there are two kinds of base pairs, and since they may each be arranged in either direction between the two strands, a change in sequence could be brought about either by a change from one kind of base pair to the other, or by a change in direction of a base pair. Recent experiments on the chemical induction of mutations in bacteriophage have shown that there are two classes of mutations which differ in several respects. The hypothesis has been advanced that the two kinds of mutation correspond to the two possible kinds of molecular change mentioned above. Confirmation of this hypothesis would represent a first step in understanding the chemical nature of mutation, and might provide an important tool for testing the coding of proteins by DNA. (See also BACTERIOLOGY.)

The year 1959 marked the 100th anniversary of the publication of Darwin's *The Origin of Species.* The event was marked by many symposia exploring the relation of Darwinian theory to the development of modern thought in many fields.[1]

[1] Some 100 papers on various aspects of Darwinism were read at a special centennial symposium held at the University of Chicago in November 1959.

UPI

To enable scientists to carry on year-round polar research and development programs, an underground city is being excavated in the snow and ice of northern Greenland. (*Left*) A digging machine hurls snow from one of the deep trenches being cut to house the Arctic city. (*Right*) Shown at an advanced stage of construction, this trench has been roofed with packed snow.

Geneticists played a prominent role in most of these symposia. Lack of knowledge of the mechanism of heredity was a principal stumbling block in the acceptance of the theory of evolution, since it was not clear how the variation on which natural selection was to operate arose or was maintained. The discovery of the particulate gene and the laws of its transmission resolved this question, and the field of population genetics subsequently supplied staunch support to the theory of evolution by natural selection. GEOGRAPHY AND EXPLORATION. Geographical exploration and research continued during 1959 at the rapid tempo that had characterized the International Geophysical Year (IGY), which terminated on Dec. 31, 1958. While the polar regions remained the outstanding attraction, explorers did not neglect milder and more accessible latitudes, nor did they restrict their endeavors to the earth's surface: some probed deep into the oceans and others high into the sky. In fact, it became apparent that the explorer, having searched out the more challenging of the earth's remote corners, was beginning to seek, like Alexander the Great, for new worlds to conquer, and that he was beginning to find them in both the ocean depths and the stratosphere.

Polar Regions.—The first permanent settlement at the South Pole was established in December 1956 as a part of the United States IGY scientific program. Some uncertainty existed as to its exact location in relation to the South Pole itself, but this was reduced during the second year of operation by taking many observations on the star Canopus with more accurate instruments than those formerly available. When computed by the U.S. Coast and Geodetic Survey, the observatory was found to be at 89°59′43.6″ south latitude, or about 1,650 feet from the pole itself. The longitude of the station is about 24.8°W., or due south of Iceland. Subsequent observations may revise these figures slightly.

At the opposite end of the world a submarine was needed to reach the North Pole, and here, too, its precise location was not easily found. During 1958 the atomic-powered *Nautilus* completed a voyage of 1,839 nautical miles across the polar basin, and on August 3 it became the first ship to reach the North Pole, although it did so without surfacing. During 1959 the atomic submarine *Skate* (Commander James C. Calvert), which in August 1958 had cruised in the polar basin and made a call at the IGY drifting Station A, made a second and more hazardous polar voyage in March 1959, at a time of year when sea ice thickness and distribution approach their maximum. The main purpose of the voyage was to test the ability of the submarine to surface either in the very limited pools or "polynyas" within the pack ice, or to break through the relatively thin layer of new ice which forms over them. In addition, further tests were to be made of the new "inertial guidance" system of navigation which was designed to determine the submarine's exact location without the aid of the compass or the customary celestial observations.

On March 17, 1959, the *Skate* surfaced at the pole and there performed the ceremony of scattering to the winds the ashes of the renowned explorer, Sir Hubert Wilkins, who almost 30 years before had attempted a polar cruise in an old World War I submarine also named *Nautilus*. During its cruise of 3,090 nautical miles under the polar ice pack, the *Skate* surfaced ten times, successfully breaking through thin ice with its reenforced conning tower.

During the polar voyages of the *Nautilus* and *Skate*, the existence of a submerged mountain range, first located in 1948 by Soviet scientists working from an ice-floe station, was confirmed. This Lomonosov Ridge extends from Ellesmere Island in northern Canada past the North Pole toward the New Siberian Islands, thus dividing the polar basin into two distinct parts, the one north of Alaska and the other north of Europe.

The ability of a submarine to cruise at will under the ice has greatly simplified the task of charting the bathymetry of the basin. For example, on a 2,400-mile cruise in August 1958, the *Skate* recorded more than 650,000 soundings, in comparison with the few hundred that would have been practicable from a surface station. However,

no submarine has yet been able to take samples of the deposits on the ocean floor or specimens of the bedrock itself. This has proved possible for expeditions based on floating ice floes and on the more massive ice islands. In this way the actual rock structure of the polar basin is being determined. Photography of the ocean bottom has also proved a useful aid. Analysis of the unconsolidated deposits on the ocean floor suggests that there have been quite radical changes in the climate of the area, as is indicated by fairly sudden alterations in the type and quantity of foraminifers laid down in the ooze. This, it is believed—and Soviet scientists have suggested the same thesis—may have resulted from a raising and lowering of the submerged sill which controls the movement of Atlantic water into the polar basin.

More than 60 years ago, Dr. Fridtjof Nansen led an expedition aboard the vessel *Fram* on a three-year drift (1893–96) across the polar basin. His main purpose was to study the movement of ice and ocean currents and record the marine life at various locations. His technique was repeated in 1947 by the Soviet vessel *Sedov* and later by seven Soviet stations on drifting ice, as well as by three United States stations. It has now become possible to work out in some detail the forces that control the drift of ice in this region and to relate observed results to theoretical calculations. The ice drift follows closely the sea-level atmospheric pressure systems, and the clockwise circuit followed by ice on the North American side of the pole is similar to that of the surface water. The main factor in this movement is the wind, but as Nansen had pointed out, there is a tendency for the ice to move to the right of the wind direction due to the so-called Coriolis effect. An unusual piece of evidence of the route and speed of drifting polar ice was provided in December 1959 by the discovery of a damaged Soviet airplane on an ice floe about 160 miles north of Iceland. The plane had been wrecked in 1955 during a supply mission at one of the Soviet drifting stations then near the pole and had been carried southward by the East Greenland Current. (See also ARCTIC EXPLORATION.)

During the 1957–58 Antarctic summer, a tractor expedition led by Dr. Vivian Fuchs completed a 98-day, 2,158-mile traverse of the continent from Weddell Sea to Ross Sea. This was the most spectacular but not the only long traverse undertaken. Because such journeys provide almost the only means for securing data on the structure of large areas of the Antarctic continent, many have been carried out and others will be undertaken during the years to come. Among the more recent of these was a United States expedition through part of Victoria Land, which began on Oct. 15, 1958, at the Little America Station and ended on Jan. 31, 1959, at Scott Station on McMurdo Sound. The route chosen made possible studies not only of the thick icecap which rests on bedrock, but also of the floating sheet of ice known as the Ross Ice Shelf, which was shown to be as much as 3,000 feet thick in places. On Dec. 26, 1959, a Soviet tractor train completed a notable journey to the South Pole from a coastal station at Mirny.

Thanks to observations accumulated by such scientific parties, it is becoming possible to check theories about the geological structure of Antarctica. About 50 years ago, Dr. Griffith Taylor, the geographer on Robert Falcon Scott's last expedition (1911–12), suggested that the Antarctic continent was in fact at least two distinct land masses, largely buried under thick ice and separated by a graben or trough linking the Weddell and Ross seas. One side—that nearest to Africa and Australia—consists of a vast raised "shield" of very ancient rock upon which rests the ice of the south polar plateau: this is East Antarctica. West Antarctica is radically different, consisting mainly of folded ranges and plateaus similar to those of the Andes of South America. The Graham-Palmer Peninsula provides the link between Antarctica and the Western Hemisphere. Traverses made by United States IGY parties from both the Weddell Sea and Ross Sea sides have confirmed the existence of deep troughs in the continent extending, in one case, 8,000 feet below sea level. It should be possible within the next year or two to confirm or disprove the Taylor hypothesis of Antarctic structure.

The extent to which scientific research in Antarctica has become a routine matter is demonstrated by the existence of about 40 more or less permanent scientific stations distributed around the margin of the continent at strategic locations in the interior and on offshore islands. The international collaboration between their scientific personnel is unequaled anywhere else, and the international agreement reached in 1959 to stabilize political matters there and open the whole continent to the world's scientists is a most encouraging recent development. (See also ANTARCTICA).

Ocean Research.—International collaboration in marine research has an even longer history, and in keeping with it a long-range systematic study of the Indian Ocean under international auspices was announced during 1959. The research vessels of several nations continued about their regular business. The Soviet ship *Lomonosov*, under the leadership of Prof. Arkady Kolesnikov, undertook a four-month voyage which included a visit to New York City for the International Congress on Oceanography, Aug. 31–Sept 11, 1959. The Soviet Union also revealed that a large submarine designed specifically for oceanographic research had completed extensive voyages in the Atlantic Ocean. The vessel is said to have been equipped with large windows to permit the study of marine life while en route. The veteran British survey vessel R.R.S. *Discovery II* studied a submerged island known as Galicia Bank lying off the northwest coast of Spain in the area of the fabled "lost land of Atlantis." The island is about 20 miles long, with a flat top and steep sides, and lies at a depth of about 400 fathoms.

In an attempt (the fifth thus far) to emulate the renowned Kon-Tiki expedition from Peru to Polynesia, a Czech-led party of four set out from Callao, Peru, in April 1959. Their balsa raft Cantula II survived several violent storms and was finally reported in August to have reached Polynesian waters. These voyages increase the knowledge of winds and ocean currents in this part of the Pacific Ocean, but their success in demonstrating the Peruvian origins of Polynesian civilization remains in dispute.

The launching of two very powerful new icebreakers should result in greatly increased scientific achievements on the fringes of the polar basin. At Leningrad the atomic-powered *Lenin* completed her sea-going trials in 1959. The Canadian *John A. Macdonald*, which went down the ways in November 1959, is not expected to undertake an Arctic voyage until late 1960 or early 1961. While the *Lenin* is undoubtedly the world's largest and most powerful icebreaker, the Canadian vessel takes third place after the U.S.S. *Glacier*. (See also OCEANOGRAPHY.)

Mountaineering.—Mountaineering expeditions were very active during 1959, in part because of the great advances made in cold-weather clothing and other equipment, and in specially compact and

nourishing foods. They were aided in many cases by aircraft both for transportation of personnel to formerly inaccessible spots and for supplying parties by landing or airdrop.

The major area of concentration was in the Himalayas and related areas where climbing parties from several countries were in the field, while the plans for others were announced. Disaster overtook a number of groups, the outstanding tragedy being the loss of a party of women climbers from France. Attempting the conquest of Cho Oyu (26,861 feet), the party, led by the experienced mountaineer Mme. Claude Kogan, left Katmandu on Aug. 21, 1959, and set up a base camp at 19,000 feet, with a second camp at 22,500 feet. The climbing party of three were then overcome by a blizzard at about 23,000 feet, and rescuers were unable to find any trace of them.

Another tragedy occurred during a British attempt to climb Ama Dablam (22,300 feet) in the Himalayas, which is regarded as among the most difficult peaks in the world. The final party of two may in fact have succeeded and been lost on the return, but nothing definite is known of them on the last 1,000 feet of the climb. Three other British climbers lost their lives on Himalayan expeditions. An Austrian expedition succeeded in climbing Haramosh (24,270 feet) in August, and an Italian group climbed Gasherbrum IV. Final details are not yet available about a four-man United States expedition which went to the Mount Everest area in search of "the abominable snowman" under the auspices of the San Antonio Zoological Society. Reports stated that they had returned to civilization with a skin, claimed by the local population to be that of "a child snowman."

Mount McKinley was conquered again, this time by the more difficult southern route. Led by Jake Breitenbach, a guide at the School of American Mountaineering in Wyoming, four members of the American Alpine Club were landed by airplane on the mountain at 7,000 feet altitude in June. Higher camps were made at 12,500 feet, at 15,000 feet, and finally at 16,800 feet. The final 400 feet of the climb was up an almost vertical snow wall. The climbers found at the summit the pole left in 1947 by Bradford Washburn.

In June, Maj. William D. Hackett led a 7-man party up Mount Logan (19,850 feet) in the Yukon Territory, the highest point in Canada and the second highest mountain in North America. Accomplishments of this party included the fourth ascents of the Central Peak (summit) and the West Peak (19,750 feet); a first ascent of the North Peak (19,000 feet); and establishment of the highest camp (18,600 feet) ever made in North America.

In a mass attack on peaks in the Peruvian Andes, a party of 14 Swiss mountain guides climbed 17 new peaks, the highest being a 20,490-foot peak in the Volcabamba Range northwest of Cuzco. Scientists attached to the expedition carried out topographic and botanical studies below the snow line.

Soviet mountaineers have for some years been active in the Central Asian ranges, particularly the Pamirs and the Tien Shan. During August an 11-man group scaled Mount Voroshilov (21,664 feet) near the Indian frontier. The American Geographical Society of New York sent a seven-man expedition to southern Chile for a two-month study of mountain glaciers. Their main purpose was to obtain data on movements of glaciers in the past 10,000 years, for comparison with results obtained in southeastern Alaska where the society has been at work since 1948.

TREVOR LLOYD,
Professor of Human Geography,
McGill University.

GEOLOGICAL SURVEY. The U.S. Geological Survey collects, publishes, and distributes data concerning the physical features, water, and mineral resources of the United States and its territories and possessions. Its major responsibilities include preparing geologic maps; gathering and publishing data concerning the nation's mineral, mineral fuel, and water resources; preparing and maintaining topographic maps of the National Topographic Map Series; classifying public lands as to mineral and water power potential; and supervising mineral leasing on federal and Indian lands.

In 1959, in addition to its nationwide activities, the Geological Survey's technical assistance program of geologic, mineral-resource, and water-resource investigations and topographic mapping was conducted in 15 countries in Latin America, Africa, Asia, and the Far East under auspices of the International Cooperation Administration (ICA). Eighty-nine participants from 24 countries received training in the Survey's domestic program under sponsorship of the ICA, Atomic Energy Commission, and United Nations.

Geologic Investigations.—Geologic mapping and related laboratory investigations were continued in 1959 as part of the Survey's goal of preparing an adequate geologic map of the United States and appraising its mineral resources. These investigations, leading to the preparation of geologic maps and reports, also provide a supply of geologic and mineral-resource data to meet the ever-increasing needs of the nation, and, through the research program, assist in the development of techniques for exploration for mineral raw materials essential to the national economy.

In 1959, mineral deposit investigations included a survey of bauxite deposits on the island of Kauai, Hawaii; studies in the geochemistry of sea water and the concentration of important elements in the sea; investigations of light-isotope ratios, which constitute one of the more promising approaches to the problem of ore genesis; studies of the largest known United States uranium reserves at Ambrosia Lake, N.Mex.; and the collection of new geophysical information on large areas of the United States in the course of obtaining airborne radioactivity and magnetic data while monitoring atomic reactor sites for the Atomic Energy Commission.

In support of these and other investigations, some 13,000 thin and polished sections of rocks and minerals were prepared for examination by geologists, and nearly 14,000 samples were analyzed by chemical, spectrographic, X-ray, microscopic, and other methods.

Mapping and stratigraphic studies, as a part of exploration programs, were in progress in 24 petroleum-producing or potentially producing states. Investigations of coal-bearing areas were carried on in 10 states.

Topographic Surveying and Mapping.—Preparing and maintaining the quadrangle maps that make up the National Topographic Map Series are a major responsibility of the Geological Survey. These multipurpose, "three-dimensional" maps provide basic information on terrain and existing works of man, for use in studies of mineral and water resources, engineering projects, national defense, community planning, and for many other purposes.

In 1959, about 1,700 new maps were published, and mapping projects were under way in

UPI

Streams of lava spill down the slopes of Kilauea Iki on the island of Hawaii, forming a fiery river on the crater's floor, during an eruption which began on November 14.

every state in the Union, the District of Columbia, Puerto Rico, and the Virgin Islands. About 22,000 published topographic maps are now available, most of them selling for 30 cents each. Free map indexes for each state, available on request, show the location of each of these maps. As in previous years, many of the states participated in cooperative mapping programs in which the cost was divided between state and federal funds. (See also CARTOGRAPHY.)

Water Resources.—Water-resources investigations by the Survey were accomplished in 1959 in cooperation with all states and with several federal agencies. The program is designed to determine where and in what amount water is available, the extent and types of water use, the quality of the water, and the extent to which development and use have impaired or may impair its quality, or deplete its amount; and to study and develop hydrologic principles and their application to the solution of water problems.

In 1959, streamflow records were obtained at 7,100 measuring stations throughout the 50 states, Puerto Rico, Samoa, and Guam. The work of compiling all streamflow records in the United States for the period 1888–1950, a project started in 1951, was 98 per cent complete in 1959.

Ground water investigations in 1959 included approximately 640 projects, about four fifths of which were operated in financial cooperation with state and local public agencies in 46 states and Guam. About a fifth of these studies, predominantly of national interest or of direct concern to other federal agencies, were financed wholly from federal funds.

Basic studies of the chemical quality of a large number of streams, lakes, springs, and wells were made in 1959. These included examinations of water samples from the basins of the Colorado, Pecos, Missouri, Columbia, Connecticut, and Yadkin–Pee Dee rivers. The program also included the beginning of studies of the distribution and concentration of radioactive waste in streams through fluvial sediment.

Conservation.—The Geological Survey classified federal land as to mineral and water power resources, and supervised development and producing operations for oil, gas, and minerals from leases on federal, Indian, outer continental shelf, and naval petroleum reserve lands. During the fiscal year 1959 a total of 33,623 cases involving mineral classification of public lands were processed. Water and power investigations on public lands involved surveying some 400 miles of streams and 9 dam sites, and the publishing of maps covering 96 miles of streams and 12 dam sites. A total of 84,789 acres were added to power site reserves, and 68,388 acres were removed, resulting in a net total of 7,222,063 acres in reserve.

The Survey's mineral lease supervisory function involved all phases of exploration, development, and production of leasable minerals and oil and gas. Supervised minerals produced in the fiscal year 1959 were valued at $170,027,891, with royalties amounting to $3,177,575.

Production value of oil and gas on federally supervised leases during the fiscal year 1959 was appreciably greater than in fiscal 1958, with correspondingly greater royalty returns to the federal Treasury, the various states, and to Indian beneficiaries. Drilling for oil on the supervised leases during the year included the spudding of 3,058 wells and completion of 2,977, of which 2,048 were productive of oil and gas. Altogether, 42,534 wells, including 25,182 capable of oil or gas production, were under supervision at the end of the fiscal year. Production from these properties during the fiscal year 1959 amounted to 239,887,000 barrels of petroleum, 820,390,496,000 cubic feet of natural gas, and 491,082,700 gallons of gasoline and butane, with a total value of about $696,706,000 and royalty returns of about $102,130,000.

HERBERT B. NICHOLS,
Information Officer, Geological Survey.

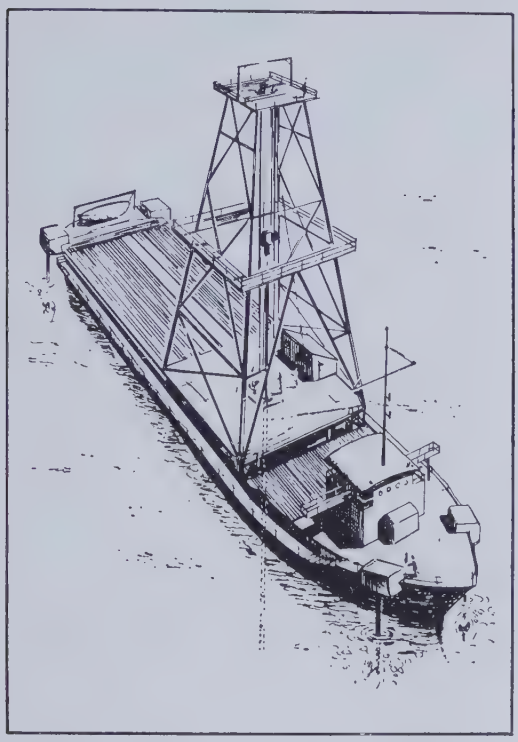
GEOLOGY. Earth History.—Absolute dating of geologic formations and events by means of carbon-14, argon, and other materials continued in 1959. Most of the newly determined dates conform to established chronology, but E. S. Larsen and associates found that the Sierra Nevada, Idaho, and other great granitic masses (batholiths) of the West are late Cretaceous—not Jurassic—in age, as has long been supposed.

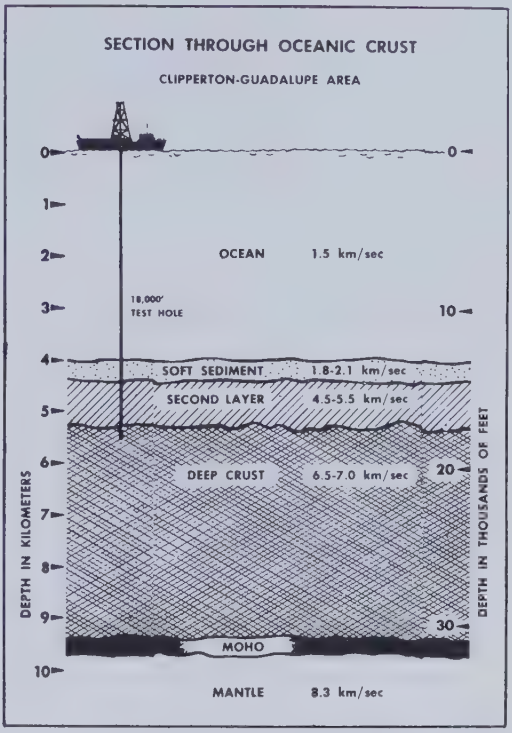
W. C. Gussow continued to map rocks of what he calls the Lipalian System in the Canadian Rockies. This system lies between the Belt and the base of the Cambrian. Gussow unites the Belt and Lipalian in the Eozoic era.

N. K. Huber found that the Animikie iron-bearing formation of the Lake Superior region accumulated in a shallow sea that spread over a lowland composed of granite and greenstone. Iron deposition was stopped by uplift. Gordon Gastil described four formations that settled in a Pre-Cambrian sea that covered Gila County, Arizona. Surrounding land was made up of volcanic rocks. P. M. Mueller found that Cross Mountain, in western Colorado, is a "fossil" mountain now being uncovered by erosion. David Hopkins traced five submergences of the land bridge that once linked Siberia and Alaska. During the late Pleistocene (Ice Age) the bridge had an arctic climate and presented tundra conditions to animals that crossed it to enter North America. Philip B. King summarized the history of the continent in *The Evolution of North America* (Princeton 1959).

Sedimentation.—J. L. Hough concluded that the banded iron deposits of Huronian age in the Lake Superior region were laid down under subtropical to warm-temperate conditions, with moderate to heavy rainfall on maturely eroded land. Silica was the principal material washed into the large freshwater lakes in which the rocks accumulated.

N. M. Strakhov decided that dolomites of various ages differ because of changes in the atmosphere and in the water under which the rocks were deposited. W. B. N. Berry traced changes in a sea that covered the Marathon district of Texas during Ordovician times, more than 360 million years ago. H. Andrew edited a symposium on *Silica in Sediments*, published by the Society of Economic Paleontologists and Mineralogists. J. M.





NATIONAL ACADEMY OF SCIENCES

Geologists have long hoped to drill a hole through the earth's crust, penetrating the Mohorovičić discontinuity (or Moho), and into the mantle which underlies the crust. Since the earth's crust averages only 5 miles in thickness under the oceans (compared with a 20-mile thickness under land masses), it is believed that the project would be feasible with presently available drilling equipment mounted on an ocean-going rig. (*Left*) This drawing shows a sea-going drilling platform proposed for the "Mohole" project. The vessel would be stabilized by four giant outboard motors. (*Right*) A proposed preliminary test boring in the Pacific would penetrate the two upper layers of the crust and reach the deep crust. The figures on the right side of the diagram show the speed of seismic waves through each of the earth's layers shown.

Weller reviewed the processes by which mud, lime ooze, and other sediments are compacted, the first step in becoming stone. P. Kuenen corrected a long-standing error by proving that sand suffers little wear as it is washed downstream by water. A. J. Carsola reported that lignite can accumulate on sea bottoms as well as in swamps.

Earthquakes and Volcanoes.—C. P. Woollard mapped three major earthquake zones in the United States and concluded that local stresses from compression or uplift cause the quakes. C. M. Duke and D. J. Leeds found that shock intensity and damage from the Mexican quake of July 28, 1957, were greatest where rocks were loose or soft, as they are under much of Mexico City. C. F. Richter prepared earthquake risk maps for the Los Angeles Basin, California, and the United States. The maps show the likelihood of earthquakes but do not predict their occurrence. D. Tocher and D. J. Miller found that the Alaskan quake of July 9–10, 1958, was caused by movement along a well-known fault. In some places the land moved horizontally as much as 21 feet 6 inches. Enormous "tidal waves" were caused by landslides. (See also SEISMOLOGY.)

The most spectacular volcanic eruptions in 1959 were those of Kilauea Iki on the island of Hawaii. Beginning on November 14, the eruptions occurred intermittently for over a month. Other volcanic eruptions during 1959 included those of Mounts Aso and Asama in Japan, Tupungatito and Gualatire in Chile, and a new volcano on Soviet-held Sakhalin island, north of Japan. M. Maldonado-Koerdell described the eruption of Barcema Volcano, Mexico, which built an island 1,200 feet high in the first 12 days of August 1952. A. R. McBirney concluded that volcanic necks rise because molten rock disrupts and engulfs older rocks above and around them, allowing the fragments to sink.

Structural Geology.—W. H. White traced six major epochs of mountain building in British Columbia. The greatest of these built the Rocky Mountains some 60 million years ago. H. J. Hsu suggested that the great basins called geosynclines developed where the crust is thin, after periods of shifting and earthquakes. W. P. Wheeler found that great blocks of rock (grabens) sink because tension has weakened the crust, not because they are forced downward by shrinking and compression. Tests in Alberta, Canada, indicate that the crust extends 43 kilometers (26.7 miles) below the surface.

Rocks and Minerals.—V. I. Kudryoshova found Russian pillow lavas associated with fresh-water fossils, showing that the molten rock erupted into lakes. V. V. Tikhomirov concluded that most granites were produced by metamorphism under conditions peculiar to the earth. Even then, granite can form only under high lands. Several new minerals were described (see MINERALOGY), and W. A. Bassett traced the changes that produced vermiculite at Libby, Mont., site of North America's largest vermiculite mine.

Ice Age and Glaciation.—Popular as well as scientific interest was aroused by a theory of glaciation advanced by M. W. Ewing and W. L. Dunn. They believe that the Pleistocene Ice Age began when the North Pole, which they claim had been in the mid-Pacific for ages, shifted to the Arctic Ocean. Its near-isolation resulted in a concentration of cold which led to excessive snowfall, and so began the cycles of glaciation and melting that

characterized the Pleistocene. Present northward warming of the Atlantic and thinning of ice on Greenland are regarded as changes that will lead to increased snowfall and another advance of continental glaciers in the Northern Hemisphere. Several geologists, including those who think the poles have not wandered greatly, object to this theory.

Paleontology.—Volume 1 of Part O, *Arthropoda,* of the *Treatise on Invertebrate Paleontology,* has been published. The work of several authors, it describes primitive animals with jointed bodies, and the trilobitomorphs.

One of the most interesting discoveries of 1959 was announced in a relatively obscure journal.[1] T. A. Ford described Pre-Cambrian fossils which seem to be highly organized algae with stalks and discoidal holdfasts. No organisms of this type were known previously from studies of very ancient strata.

The late C. E. Decker and Neal Hassenger, in a study of graptolites, described extensible tentacles, walls housing stinging cells, and structures providing for bisexual production. The authors consider this to be evidence that graptolites are coelenterates, not hemichordates. The latter interpretation was advanced by R. Kozlowski in 1948.

Publications.—For decades, bibliographies compiled by the U.S. Geological Survey, the Geological Society of America, and other organizations have listed published articles and books covering the range of the earth sciences. Since January 1959, abstracts (chiefly of publications in English and Russian) have been provided in *GeoScience Abstracts,* issued by the cooperative American Geological Institute, Washington 25, D.C.

GEORGIA. South Atlantic state, United States; one of the original 13 states. The "Cracker State" ranks 21st in area and 16th in population among the 50 states.

Area and Population.—Area: 58,876 square miles (land, 58,483; inland water, 393), divided into 159 counties. Population: (1950) 3,444,578; (est., July 1, 1958) 3,787,000. Urban places with populations above 10,000 (as estimated by the Georgia Department of Health for July 1, 1958) are:

Albany	41,500	Gainesville	14,200
Americus	13,100	Griffin	21,900
Athens	34,400	Hapeville	11,100
Atlanta (*capital*)	496,000	La Grange	28,500
Augusta	97,800	Macon	80,300
Brunswick	20,700	Marietta	31,500
Cartersville	10,200	Milledgeville	10,500
Cedartown	10,400	Moultrie	13,800
College Park	19,700	Rome	33,800
Columbus	101,300	Savannah	139,700
Cordele	10,700	Thomaston	11,100
Dalton	19,500	Thomasville	16,700
Decatur	25,900	Valdosta	28,200
Dublin	12,200	Warner Robins	17,653*
East Point	28,100	Waycross	22,700

* Special census, 1957.

Executive.—Chief state officers in 1959:
Governor: S. Ernest Vandiver (Democrat)
Lieutenant Governor: Garland T. Byrd
Secretary of State: Ben W. Fortson, Jr.
Treasurer: George B. Hamilton
Attorney General: Eugene Cook
Auditor: B. E. Thrasher, Jr.
Supt. of Public Instruction: Claude L. Purcell

[1] Ford, T. A., "Pre-Cambrian Fossils from Charnwood Forest, England," in the *Proceedings* of the Yorkshire Geological Society, vol. 31, pp. 211–217 (1958).

Constitution and Judiciary.—The present constitution went into effect in 1945. The Supreme Court comprises seven justices; chief justice in 1959 was William H. Duckworth.

Legislature.—The Georgia General Assembly comprises a 54-member Senate (in 1959, 53 Democrats, 1 Republican) and a 205-member House of Representatives (204 Democrats, 1 Republican), which meet annually commencing the second Monday in January.

In its 1959 session the assembly authorized the governor to close any public schools and state-supported colleges, or units thereof, whenever he finds that their continued operation is likely to lead to public disorders; set up a compensation arrangement for teachers in public schools closed by the governor that would permit payment for the balance of the 12-month contract period and, at the governor's discretion, for an additional 12 months; stiffened entrance requirements to the state university system for those over age 21 seeking admission to undergraduate units and for those over 25 applying for entrance to graduate schools; and allowed state income tax credit for any contributions made to any corporation, foundation, or trust organized and operated for educational purposes.

The legislature also enacted several measures leading to the elimination, through consolidation or abolishment, of some two dozen state agencies; established an Office of Legislative Counsel, a Governor's Committee on Economy and Reorganization, and an Industrial Development Administration; authorized the governor to create a crime commission; exempted from the state merit system any employee holding a policy-determining or confidential position within a state agency; wrote a code of ethics for state employees; established a per diem payment of $10 for all board of education members for whom compensation is not locally provided; and opened all state, county, and municipal records to inspection by citizens unless prohibited by law or court order.

Among miscellaneous actions the assembly passed new regulations affecting the makeup of boards of directors of banks located in the state; tightened requirements for the sale of securities; raised the maximum daytime speed limit on highways to 65 miles per hour and the nighttime limit to 55; imposed new limitations on maximum sizes of motor vehicles; barred the use of certain deceptive advertising practices by gasoline stations; and established a new fee schedule for hunting and fishing licenses for nonresidents.

Finance.—In the 1958–59 fiscal year, state revenue of $342,777,438.85 comprised $338,407,525.30 from state tax sources and $4,369,913.55 from the federal government. Tax revenue included $134,161,350.06 from a 3% general sales tax, $28,968,185.45 from individual income taxes, $20,644,844.46 from corporate income taxes, $80,494,604.32 from motor fuel taxes, $18,704,909.71 from licensing, and the remainder from other state tax sources. Expenditures of $354,666,153.87 consisted of $182,454,389.41 for education, $53,798,007.19 for health, welfare, and safety, $81,028,546.22 for highways, and $37,385,211.05 for all other purposes. The state had no long-term indebtedness.

Banking.—As of June 10, 1959, the state's 51 national banks had $1,590,420,000 in assets, $1,127,501,000 in demand deposits, and $294,771,000 in time deposits. The 311 state banks and their 27 branches had (June 30, 1959) assets of $1,366,937.73, demand deposits of $632,822,223.05, and time deposits of $394,267,672.76.

Education.—School attendance is compulsory between the ages of 7 and 16, inclusive. According to National Education Association estimates, expenditures for public elementary and secondary education in the 1959–60 school year totaled $200 million ($241 per pupil), and revenue comprised $49 million from local school districts, $166 million from the state, and $16 million from the federal government. Capital outlays amounted to $60 million, and teachers' salaries averaged $3,668 (high school, $3,868; elementary, $3,568).

In the 1958–59 school year there were 1,940 public elementary and secondary schools with 708,160 elementary pupils served by 20,657 teachers, and 273,063 secondary pupils taught by 11,867 teachers. Higher education facilities included 7 junior colleges with 166 instructors and 2,991 students; 1 teachers college with 49 instructors and 1,048 students; and 11 colleges and universities with 1,337 instructors and 20,594 students.

Social Welfare.—In the 1958–59 fiscal year, public assistance expenditures from federal and state funds (excluding institutional costs) totaled $83,403,545, including $54,465,036 for the aged, $16,455,711 for dependent children, and $10,322,568 for the permanently and totally disabled. A monthly average of 163,724 persons received public assistance.

Labor Force.—The 996,200 salaried nonagricultural workers in July 1959 compared with 956,100 a year earlier and with an average of 981,600 for the 12 intervening months. Of those employed in July 1959, 33.2% were engaged in manufacturing and 21.6% in wholesale and retail trade. Insured unemployment of 25,378 in mid-July 1959 was less than half the 51,927 total for the previous July. The state paid $30,801,758 in unemployment compensation claims during the year ending July 31, 1959.

Manufacturing.—The 328,854 persons employed in the state's manufacturing plants in 1957 earned $1,071,892,000 in wages. Value added by manufacture totaled $2,137,662,000, and outlays for new plant and equipment amounted to $195,750,000. Production workers averaged $66.17 for an average workweek of 41.1 hours in August 1959.

MAJOR GEORGIA MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.* (thousands of dollars)
Textile mill products	102,626	$283,402	$467,635
Food and kindred products	40,672	129,210	364,653
Transportation equipment	29,426	164,911	304,531
Pulp, paper, and products	16,717	78,060	226,706
Apparel and related products	41,617	98,255	163,486
Chemicals and products	11,169	40,812	120,460
Lumber and wood products	31,231	61,862	108,184
Stone, clay, glass products	8,154	26,409	57,101

* For definition, see text footnote 1 in the article *Industrial Production.* (Source: *Annual Survey of Manufactures: 1957.*)

Mining.—In 1958 Georgia ranked 35th among the states in the value of its mineral output, with 0.38% of the national total. It continued to lead in china clay output, was second in fuller's earth (23% of domestic output) and scrap and flake mica, and third in barite.

GEORGIA MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Clays	2,942,000	$31,253,000
Coal	9,000	44,000
Iron ore, usable (long tons)	209,000	1,008,000
Mica	8	82,000
Sand and gravel	2,631,000	2,693,000
Stone	12,129,000	31,108,000
Other minerals	...	10,145,000
Total	...	$75,106,000*

* Total adjusted to eliminate duplication in value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1959 dropped to $527,445,000 from the $540,902,000 for the corresponding period of 1958. For the full year 1958, income comprised $416,149,000 from livestock and livestock products, $304,560,000 from crops, and $48,413,000 from government payments. Principal income sources in 1958 were: broilers, $164,521,000; cattle, $69,748,000; hogs, $68,807,000; and cotton lint, $65,386,000. Forest products yielded $33,338,000.

In 1958 there were 160,000 farms in the state.

GEORGIA CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Corn (1,000 bu.)	54,176	86,752	81,909
Cotton lint (1,000 bales)	655	352	525
Cottonseed (1,000 tons)	269	144	216
Hay (1,000 tons)	679	641	574
Oats (1,000 bu.)	11,412	9,108	8,832
Peanuts (1,000 lb.)	540,052	612,850	552,375
Pecans (1,000 lb.)	35,370	45,000	39,000
Soybeans (1,000 bu.)	536	1,125	1,392
Sugarcane sirup (1,000 gal.)	1,372	525	570
Sweet potatoes (1,000 cwt.)	1,137*	528	611
Tobacco (1,000 lb.)	119,353	91,074	106,548
Wheat (1,000 bu.)	2,099	1,587	2,255

* Average, 1949–57. (Source: U.S. Department of Agriculture.)

UPI

Beneath a smoldering railroad trestle near Meldrim, Ga., workmen search for victims of a disastrous blast on June 28. Explosion of two butane tank cars killed some 23 picknickers and injured many others.

Total acreage (1954) of 24,019,000 included 6,117,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 1,515,000 cattle, 1,780,000 hogs, and 9,651,000 chickens (excluding commercial broilers). An average of 132,000 family workers and 47,000 hired employees worked on farms in Georgia during the period January through July 1959.

Transportation and Communications.—In the 1957–58 fiscal year, state and federal funds spent for highways totaled $95,318,945.76, and contracts for new construction covered 1,859 miles.

Highways and roads on July 1, 1958, totaled 88,511 miles (23,704 surfaced). Registered *motor vehicles* numbered 1,307,993 as of Oct. 1, 1958, including 1,038,374 passenger cars. There were (1958) 32 *railroads* operating 5,945 line miles; 5 regularly scheduled *airlines;* and 138 *airports and airfields* (98 commercial and municipal, 10 military, and 30 private).

Communications media (1958) included 125 AM and 19 FM *radio stations;* 13 VHF and 3 UHF *television stations;* 30 daily *newspapers* (circulation, 860,814) and 191 other newspapers (325,000); and (Jan. 1, 1959) 302,700 business and 743,500 residential *telephones.*

Principal Events, 1959.—The Atlanta Board of Education, under a July 9 order of U.S. District Judge Frank A. Hooper, was instructed to file a plan on or before December 1 for the desegregation of the Atlanta public school system.

The plan submitted on November 30 follows closely proposals adopted in Alabama and Virginia. Essentially it is a pupil-placement plan based on such factors as availability of transportation, suitability of the established curriculum for the particular applicant, available room and teaching capacity, scholastic aptitude, relative intelligence or ability of the pupil, and possible friction and disorder among pupils. Under the new plan, children are to be assigned "without regard to race or color" to 12th grade classes the first year and in each successive year to the next lower grade.

The proposal was forwarded to the state General Assembly, which was to convene in January 1960. The plan, as presented, was scheduled to go into effect the following September 1. Two existing state laws were expected to have a bearing on fulfillment of the plan. One provides that if any public school or state-supported college is subjected to a final integration order by the federal courts the governor is required to close the unit or units ordered integrated. The other law, passed in 1959, gives the governor authority to close any school or college if he feels that its continued operation would lead to violence or disorder.

Economic gains were reported in many fields in 1959. During the year ended July 1, 1959, Georgia farm real estate value increased 10%, compared with an average national rise of 6%. This rate of increase was second highest among Southern states.

Nearly 200 new industrial plants were located in Georgia during the first 10 months of 1959, twice the number established in the comparable period of 1958. These new plants, representing an investment of approximately $100 million, hired 8,000 new employees and added $25 million annually to the state's payrolls. Statewide employment of 1,010,900 in October 1959 was 32,400 above that of a year earlier. Nine-month figures showed department sales to be up 7% over those for the comparable period of 1958; bank deposits up 3%; and building permits up 24%.

Jekyll Island, the former home of millionaires and now owned by the state, was developed as a new state park. A causeway near Brunswick leads to the island.

On June 28, two tank cars of butane gas exploded on a railroad trestle above a recreation area at Meldrim, near Savannah. Twenty-three persons were killed and many others were injured in the inferno. The cause of the accident, although not finally determined, was thought to be a spark from the train.

At Atlanta in 1959 the dome of the State Capitol was gilded with gold mined in Lumpkin County, site of the first gold mine in the United States. Also at Atlanta, a special program held October 10 in the Municipal Auditorium, celebrated the attainment of a population of one million by the Atlanta metropolitan area.

Legislature and Principal Events by:
JOHN C. MEADOWS,
Professor of Sociology, The University of Georgia.

GERMAN LITERATURE. **Drama.**—Over 200 West German theaters, visited annually by 30 million spectators, continued to rely heavily in 1959 on German classic and prewar plays and translations of foreign dramas. In the 1958–59 season, the *Diary of Anne Frank* was performed 3,400 times in 122 theaters. Works by Bertolt Brecht, especially *Mother Courage* and *The Good Woman of Sezuan,* were performed 962 times. Three of Brecht's plays were premièred posthumously: *Der unaufhaltsame Aufstieg des Arturo Ui,* a gangster play, at Stuttgart in the fall of 1958; *Die heilige Johanna der Schlachthöfe,* at Hamburg, and *Schweyk im Zweiten Weltkrieg,* at Frankfurt am Main, both in the spring of 1959. Karl Wittlinger's *Kennen Sie die Milchstrasse?* was performed 661 times in 35 theaters.

The Swiss dramatist Friedrich Dürrenmatt received the 1959 Mannheim Schiller Prize as the "most important living playright in German." Max Frisch, another Swiss playwright, received the Georg Büchner Prize and the Literature Prize of the City of Zurich. Jean Vauthier's *Les prodiges* was premièred at Kassel under the title *Die Wunder,* even before it was performed in Paris.

Menander's 2,300-year-old comedy, *Dyskolos,* was given its première at the Vienna Burgtheater after the Swiss collector Martin Bodmer discovered the complete text of the hitherto fragmentary work. Franz Grillparzer's 150-year-old play, *Blanka von Kastilien,* with a background of 14th century Spain, was first presented in the Vienna Volkstheater.

Poetry.—Wilhelm Lehmann (b. 1882), the Nestor of nature lyricism (*Antwort des Schweigens,* 1935; *Der Grüne Gott,* 1942; *Entzückter Staub,* 1946; *Noch nicht genug,* 1950), received the Schiller Memorial Prize for 1959 in Stuttgart. Wilhelm von Scholz (b. 1874) published a new volume of poems, *Raum über uns,* and a new selection of his many short stories, *Das Inwendige.* Nelly Sachs (b. 1891) collected her third volume of poetry under the title *Flucht und Verwandlung.* Werner Bergengrün (b. 1892) published a collection of poems, *Figur und Schatten.* Horst Lange (b. 1904) and some of the younger West German poets, among them Erich Lotz and Johannes Poethen, also published collections of their lyrics. Günter Eich (b. 1907) received the Georg Büchner Prize. *Primäre Tage,* a collection of poems and fragments, was published posthumously from the literary remains of Gottfried Benn (1886–1956). Austria is represented with volumes of poetry by Paul Celan, Christine Busta, Gerhart Fritsch, Christine Lavant, Hertha Staub, and Friedrich Torberg; and Switzerland, by Heinrich Wiesner.

Novels.—The generations born before 1900 are amply represented with new prose fiction. Agnes Miegel (b. 1879), who is considered the greatest living writer of ballads, published *Truso,* six stories from her former East Prussian home. Leonhard Frank (b. 1882) wrote a novel, *Mathilde.* Ina Seidel (b. 1885) published a 948-page novel, *Michaela.* Kasimir Edschmid (b. 1890) contributed a new novel, *Drei Häuser am Meer.* Oskar Maria Graf (b. 1894), who lives in New York, published a futuristic novel, *Die Erben des Untergangs.* Carl Zuckmayer (b. 1896), who is better known for his dramas, published a story, *Die Fastnachtsbeichte.* Some short stories were published posthumously from the literary remains of Thomas Mann (1875–1955), Ernst Penzoldt (1892–1955), and Reinhold Schneider (1903–58).

The following West German writers also contributed novels or short stories: Heinrich Böll (*Billard um halb zehn*); Rudolf Hagelstange (*Spielball der Götter,* for which he received the Julius Campe Prize in the amount of 15,000 Deutsche marks); Hans Werner Richter (*Linus Fleck* or *Der Verlust der Würde*); Stefan Andres (*Der graue Regenbogen*); Gerd Gaiser; Edzard Schaper; Luise Rinser; Hugo Schnabel; Kurt Hohoff; Wolfdietrich Schnurre; and Karlheinz Deschner.

Austria is represented with new novels by Max Brod, Robert Neumann, Rudolf Brunnengraber, Gertrud Fussenegger, Franz Tumler, Jeannie Ebner, and Milo Dor; and Switzerland, by Kurt Guggenheimer and P. H. Bonner. Otto F. Walter (b. 1928) received the international Charles-Veillon-Prize-1958 for his first novel, *Der Stumme.*

Nonfiction.—Walter Jens' book of travel descriptions and essays, *Die Götter sind sterblich,* was chosen in 1959 as the "book of the month of July." Friedrich Georg Jünger reminisces in *Spiegel der Jahre.* Hermann Kesten presents a chronicle of the literary cafés in Paris, London, New York, Rome, Berlin, Vienna, and Munich in *Dichter im Café.* The Swiss poet Erwin Jaeckle published three essays under the title *Die Elfenspur.* Earlier, in 1957, William Karl Pfeiler published *German Literature in Exile* (University of Nebraska Press).

Translations.—Among the English translations of important German fiction and nonfiction, the following should be mentioned: Ludwig Dehio, *Germany and World Politics in the Twentieth Century* (Knopf); Friedrich Dürrenmatt, *The Pledge* (Knopf); Willi Heinrich, *Mark of Shame* (Farrar, Straus & Cudahy); Hans Hellmut Kirst, *The Seventh Day* (Doubleday), a plausible futuristic story of the last days of Europe in an atomic war; Arthur Koestler, *The Sleepwalkers: A History of Man's Changing Vision of the Universe* (Macmillan); Heinz Schröter, *Stalingrad: The Battle That Changed the World* (Dutton); Herbert Wendt, *The Road to Man* (Doubleday); and Ernst Emil Wiechert, *Tidings* (Macmillan). J. C. Friedrich von Schiller's *Maiden of Orleans* (University of North Carolina Press, 1959) is an American contribution to the bicentennial celebration of the author's birth.

GERMANY. The breakdown of inter-Allied cooperation after World War II has led to the formation of two separate German states: the Federal Republic of Germany in the west (Sept. 21, 1949), with its capital at Bonn; and the German Democratic Republic in the east (Oct. 11, 1949), with its capital at East Berlin. The City of Berlin, established in 1945 as an inter-Allied zone and the seat of the Allied Control Council, was equally divided in 1948, and in both sectors the occupying powers have retained certain governmental rights stemming from the inter-Allied agreement of 1945.

The reunification of Germany has remained not only the desire of the East and West German populations, but also the declared objective of the Big Four powers. The Western powers have insisted that reunification be brought about by democratic methods and have demanded free elections in East and West Germany as an essential step toward reunification. The USSR has refused to accept free elections and has demanded that reunification should be the result of negotiations between the existing West and East German governments. The Soviet Union also wants assurance that any future German state will be neutralized.

Area and Population.—That part of Germany occupied by the Big Four powers in 1945, including the Saarland, has a total area of 137,713 square miles, as compared with a pre-World War II (1937) Germany of 181,392 square miles, and a total population of 72,388,700 (May 31, 1959).

AREA AND POPULATION OF GERMANY

Division	Area (sq. mi.)	Population (estimated)
Federal Republic	95,733.0	52,765,000 (May 31,1959)
Democratic Republic	41,692.0	16,300,700 (Dec. 31, 1957)
West Berlin	186.0	2,213,000 (May 31, 1959)
East Berlin	155.6	1,110,000 (Dec. 31, 1957)
Total	137,766.6	72,388,700

Owing to the influx of more than 12 million Germans from eastern European countries and from provinces east of the Oder-Neisse line (belonging to Germany prior to 1937), the present area has a larger population than the Germany of 1937. The density of population in the Federal Republic was 550 persons per square mile on Jan. 1, 1959, compared with 419 in 1939. While the population of the Federal Republic has been rising steadily, the population of the Democratic Republic and East Berlin has declined to 17,310,670 in 1959, from 18,892,000 in 1949.

On June 30, 1958, ten West German cities had more than half a million inhabitants: Hamburg (1,796,700), Munich (1,016,500), Cologne (749,500), Essen (719,800), Düsseldorf (679,200), Frankfurt (643,100), Dortmund (629,500), Stuttgart (617,800), Hannover (558,100), and Bremen (535,100). The largest cities in the Democratic Republic (with population estimates as of Dec. 31, 1957) are Leipzig (598,909), Dresden (491,714), Chemnitz (Karl Marx Stadt) (286,016), Halle (280,614), Magdeburg (258,447), Erfurt (184,819), Rostock (149,301), Zwickau (129,953), and Potsdam (115,934).

Federal Republic of Germany (West Germany)

Government.—The German Federal Republic is a federal state composed of ten *Länder* (states): Baden-Württemberg, Bavaria, Bremen, Hamburg, Hesse, Lower Saxony, North Rhine-Westphalia, Rhineland-Palatinate, the Saarland, and Schleswig-Holstein. The constitution of May 23, 1949, divided governmental functions between the federal and *Land* (state) authorities. Public administration is mostly in the hands of the state governments, while legislative power is divided between the federal and state governments.

The Federal Republic is headed by a president elected for 5 years by a special assembly of all the members of the federal parliament and an equal number of delegates from the state parliaments. His functions are largely nominal, although he nominates the chancellor, who then must be confirmed by the parliament. The chief organ of popular representation is the Bundestag or Federal Diet, a national parliament elected by all West German citizens above the age of 21. The states participate in federal legislation through the Bundesrat or Federal Council, in which the individual states, according to their population, have from three to five votes each and are represented by members of their governments. The supreme judicial body is the Constitutional Court in Karlsruhe.

Political Developments.—The Federal Republic commemorated the tenth anniversary of its exist-

ence on Sept. 21, 1959. It came into being in 1949 by agreement of the three Western occupying powers, who gave the Germans the freedom to frame a constitution of their own choice. Under this constitution the Federal Republic gained full sovereignty by 1955, became through NATO an ally of her Western wartime enemies, and managed to develop into the second biggest industrial country in the West.

Presidential Election.—The event that caused the greatest commotion in German internal politics during 1959 was the election of a new federal president. Since the inception of the Federal Republic this office had been held by Dr. Theodor Heuss, a scholar-statesman who won a popularity for which German history offers very few precedents. Although the parties urged him to continue in office and there was a parliamentary majority

large enough to pass the necessary constitutional amendment nullifying the provision restricting a president's tenure to two 5-year terms, Dr. Heuss insisted on respecting the constitution. Chancellor Konrad Adenauer, chairman of the largest German party, the Christian Democratic Union (CDU), proposed Dr. Ludwig Erhard, vice chancellor and minister of economics, for the office, but Dr. Erhard refused to be a candidate because he wished to continue as director of German economic policy.

On April 7, persuaded by other leaders of the CDU, Chancellor Adenauer declared his willingness to be the presidential candidate of his party. The 83-year-old chancellor admittedly intended to retain in the presidential office the decisive influence on foreign policy and felt that the succession as chancellor of the present minister of finance, Franz Etzel, would allow him to do so. However, when the leaders of the CDU showed their preference for Ludwig Erhard, the greatest vote-getter of the party next to Dr. Adenauer, the chancellor publicly withdrew his candidacy on June 4 and declared his intention to continue as chancellor until after the next federal elections in 1961. Many CDU members were greatly dismayed, but they felt unable to take any action against the statesman to whom West Germany owes its recovery and its voice in international councils, although there was much public recrimination about the personal regime of the "old man."

On July 1, 1959, an electoral assembly convened in West Berlin and elected Dr. Heinrich Lübke, a member of the CDU, federal president. Dr. Lübke, 65 years of age, has a strong anti-Nazi record and was a successful minister of agriculture in Dr. Adenauer's cabinet since 1953. He entered on his new duties on Sept. 15, 1959.

State Elections.—The results of the elections of state parliaments in Lower Saxony and Rhineland-Palatinate on April 19 and in Bremen on October 11 did not indicate any important shift in popular political trends. The Christian Democratic Union and the Social Democratic Party (SPD) continue to grow at the expense of the few surviving small parties without changing their relative strength. The SPD, which always has done slightly better in state elections than in federal elections, gained a full majority in the small city-state of Bremen, but remained far from having a majority on the national level. In its desire to achieve such a majority, the SPD found itself in the same dilemma as the British Labour Party. In order to win, it had to gain greater appeal among the middle classes. Therefore, at an extraordinary party convention, held on Nov. 13–15, 1959, at Bad Godesberg, the SPD dropped most of its traditional Marxist and socialist aims. Although it might lose much of its support from the working class, the SPD intends to go with this new program into the federal elections of 1961.

Saar.—On July 5, 1959, the last official event in the reintegration of the Saar region occurred. France had attempted to separate this industrial region, comprising 2,567 square miles and 1.040,000 inhabitants, from Germany after World War II. A currency and customs union with France was effected in 1947. France agreed to have the Saar residents vote on their own future in October 1955, and accepted their expressed desire for full return to Germany. A Franco-German treaty provided for the Saar's political incorporation into the Federal Republic on Jan. 1, 1957, and for its economic integration by Jan. 1, 1960. On July 5, 1959, the customs line between Germany and the Saar was abolished, and the Deutsche mark replaced the French franc. (See also SAAR.)

Armed Forces.—The building of German armed forces, which began in 1956, will be completed by the army in 1960. The navy and air force are to attain their personnel complements in 1961–62, and will complete training with modern technical equipment in 1962–63. The NATO-approved plans envisage a peacetime strength of 350,000–380,000 for all three services. The army will have 200,000 combat troops, plus a training organization; the air force, 80,000–100,000; the navy, 27,000–30,000. The remainder is to consist of cadres for the territorial organization which is designed in case of war to protect communications and deal with emergencies behind the front arising from air attacks. The territorial organization in case of war will be strengthened in each locality by reserve soldiers in the immediate neighborhood.

In July 1959 the armed forces had a strength of 218,000 men (army, 135,000; air force, 48,000; navy, 19,000; territorial organization, 16,000). Germany has a universal conscription law, but at the present stage about 50% of the armed forces consists of long-service volunteers or career soldiers. At present only 90,000 12-month draftees are in the army; their number will be increased to 150,000 in the future.

The German Army has received most favorable critiques from United States military observers. Army maneuvers in September–October 1958, in which 80,000 men participated, showed unusual achievements in military performance. It was generally noted that the new system of liberal discipline adapted for the army's citizen-soldiers—a novelty in German military history—does not seem to have interfered with effectiveness.

Nevertheless, the German Army must overcome a number of problems. The training of a sufficient number of junior officers requires more time, as does the full production of equipment. The German government does not propose to build up a self-supporting armaments industry, but intends to keep armament purchases abroad and at home at the present 50:50 ratio. Many items are produced under foreign license; some are produced jointly with other NATO countries, such as France and Italy.

The German Army will not have heavy tanks, long-range planes, or long-range missiles. The army has received Honest John missiles from the United States, and the air force has received Matadors and Nikes. West Germany is building installations for the delivery of tactical nuclear warheads. The German units will be assigned to NATO, and only the NATO supreme commander could provide them with live warheads in case of war.

Foreign Affairs.—The diplomatic activities of the Federal Republic during 1959 centered chiefly around the problem of Berlin—a problem created by the USSR's note of Nov. 27, 1958, which declared that the Soviet Union would denounce the four-power status of Berlin, demand the withdrawal of Western troops from Berlin, and require the transformation of West Berlin into a free city within the next six months. At the same time the Soviet government reiterated earlier statements that a reunification of Germany could only be achieved by direct negotiations between the governments of West and East Germany. The threat posed by the Russian announcement was intended to produce as a first result a summit conference, but the United States insisted that such a meeting could not be held before the Soviet Union discontinued pressure by ultimatum and a conference of foreign ministers had found that some common ground existed on which the heads of state might reach further agreement.

The government of the Federal Republic par-

ticipated in the discussions among the Western powers which preceded the conference of foreign ministers in Geneva on May 11–June 20 and again on July 13–Aug. 5, 1959. The Federal Republic and the East German government participated in the Geneva conference as advisers, and the Federal Republic avoided having its foreign minister, Heinrich von Brentano, attend the official sessions because it did not wish to appear to give the satellite East German government official recognition. Chancellor Adenauer exerted his influence in Western circles by recommending an uncompromising stand on Berlin and German unification, and suggesting that a relaxation of the cold war should be sought by West-East agreement on disarmament. (See also SUMMIT CONFERENCE).

The visit of President Eisenhower to Bonn on Aug. 26–27, 1959, prior to Khrushchev's visit to the United States, was the occasion for an impressive demonstration of the strong popular support for Chancellor Adenauer's policy of close cooperation with the United States. Franco-German relations, supported by the good understanding of President de Gaulle and Chancellor Adenauer, have been highly satisfactory. The visit of Chancellor Adenauer to Paris on Dec. 1–2, 1959, showed their full agreement in political cooperation, both in the European Community and in the Western European Union, in connection with the forthcoming East-West conferences. The economic reintegration of the Saar has removed the last remaining source of friction between the two nations, and the building of the European Common Market (q.v.) draws them ever more closely together. However, some concern is felt in Germany that the uncompromising attitude of French foreign economic policy vis-à-vis England might hurt Germany as well. West Germany would wish for some arrangement between the Common Market and the European Free Trade Association (q.v.), also known as the Outer Seven, because she has a large favorable payment balance with the Outer Seven and only an even balance with those of the Common Market.

Anglo-German relations suffered from the very critical attitude that many British press organs are taking of German developments, and particularly of the supposedly inflexible attitude of Chancellor Adenauer in regard to Western relations with the Soviet Union. The chancellor on his part repeatedly complained in public about the British inclination to compromise with the Soviet Union on German reunification. The visit of Chancellor Adenauer to London on Nov. 17–19, 1959, helped to lay these animosities to rest. In talks with Prime Minister Macmillan, the chancellor reportedly agreed to discuss the future of West Berlin at an East-West summit conference.

Education.—German children between the ages of six and 14 receive their school education in eight-year elementary schools, followed, for most of them, by part-time attendance at vocational schools for another three years. About 20% of the children, after four years at elementary schools, continue their training in secondary schools, which prepare them for either university study, general business careers, or specialized vocations. In 1957 the enrollment in 34,788 primary and secondary schools totaled 6,367,270 (including the Saar and West Berlin).

The Federal Republic, including West Berlin, has 18 universities and 8 technological colleges. In addition, there are a number of ecclesiastical seminaries, teachers colleges, and academies of arts. In the winter semester of 1958–59, 186,210 German students (including 37,084 women) and 14,875 foreign students were enrolled in these institutions. There are also 404 adult education schools and 721 youth hostels.

UPI

West German Chancellor Konrad Adenauer (left) and President-elect Heinrich Luebke (right) talk with President Theodor Heuss prior to a banquet given at Bonn in honor of Heuss on his retirement from office on September 12.

Religion.—The census of Sept. 30, 1950, showed that in the Federal Republic 51.2% of the population was Protestant; 45.2%, Roman Catholic; 0.1%, Jewish; 3.2%, of other faiths; and 0.3%, with no declared faith. As a result of the large immigration of East Germans, the relative number of Protestants in the Federal Republic has grown slightly since 1950.

Economic Conditions. *Currency and Banking.*—The German currency, which was devalued in 1948 by the Allied Military Government, has become one of the world's most stable currencies. On Jan. 12, 1959, the Deutsche mark was made convertible at the official rate (DM4.20 = U.S.$1) into all foreign currencies for residents and nonresidents. On Dec. 31, 1958, the gold and foreign exchanges of the German Federal Bank amounted to $6,322 million, of which $2,639 million consisted of gold and $2,046 million of United States and Canadian dollars. The exceedingly high reserves were the result of the accumulation of balance-of-payments surpluses earned since 1951.

The development of a great money liquidity enabled the German banks to refrain from bor-

Disappointed in his hope for the chancellorship, West German Finance Minister Erhard (center, rear) hears Chancellor Adenauer tell the German Parliament on June 11 that his decision to remain in office was given to Erhard in May.

WIDE WORLD

rowing large sums from the Federal Bank and thereby caused them to become irresponsive to the latter's policies. During 1959 the attempt of the Federal Bank to move part of its accumulating reserves back into the international flow of funds and to limit the liquidity of the German banks met with growing success. Beginning with a high of 5.5% in September 1956, the discount rate was lowered in stages to 2.75% as of Jan. 9, 1959—an all-time minimum in the history of the German currency since 1875. The low rate was to discourage the inflow of foreign investment money and to induce German banks and firms to keep acquired foreign assets for investment abroad rather than buying German marks from the Federal Bank. In order to meet signs of inflationary pressures arising from growing business activity, the Federal Bank raised the discount rate from 2.75% to 3% on September 4, and to 4% on Oct. 22, 1959.

Balance of Payments.—Other measures of the Federal Bank, together with natural developments, have considerably changed the general picture of high German trade and balance of payments surpluses. The reserves of the Federal Bank declined in the first seven months of 1959 by DM3.8 billion and fell to DM22.1 billion by September 1. The reason is found chiefly in the deficit of the international capital balance. While the balance of trade and services showed a surplus (Jan. 1–July 31, 1959) of DM4.5 billion, the balance of international capital movements was passive at DM7.7 billion. This deficit is the result of the large prepayments for foreign arms deliveries, premature payments of foreign debts, special payments to foreign powers, and German investments abroad. Some of these payments will not have to be made again—as, for example, DM382 million to France in connection with the Saar settlement, DM282 million as a contribution to the stationing of British troops in Germany, and DM895 million for the premature debt payment to the United States and the United Kingdom. The early payment for arms purchases (still undelivered) of DM1.8 billion may not have to be repeated in this form, but substantial purchases will continue for some time.

The balance on account of goods was relatively weaker. German exports during the first 7 months of 1959 were DM22.3 billion, or 7.6% higher than in the same period in 1958, but imports were DM19.2 billion, a rise of 8.6%; and as a consequence, the export surplus of DM3.1 billion was practically identical to that for the comparable period in 1958. The favorable balance on account of services declined in the first half of 1959 to DM1.4 billion from DM1.7 billion in the first half of 1958, owing very largely to a 30% increase in spending by German tourists abroad, while the amount spent by foreign tourists in Germany remained virtually identical.

Budget.—The federal budget for the fiscal year ending March 31, 1960, provides for expenditures of DM39,788.9 million (DM38,724 million in 1958–59). Ordinary receipts are estimated at DM32,150 million. A deficit of about DM5 billion will have to be covered by loans, though actual expenditures may again, as in recent years, be smaller than estimated owing to delays in purchasing equipment for the armed forces. The 1959–60 budget has earmarked DM11,771.7 million for defense.

National Product.—The national production index (1936 = 100) rose steadily from 154 in 1953 to 232 in 1958. The general national product reached an estimated value of DM222.3 billion in 1958, or 6.1% more than in 1957. In terms of real value the gross national product increased by only 3% in 1958, as compared with 5% in 1957, 6% in 1956, and 12% in 1955. The economic recession of 1958 took in Germany, as in Europe in general, a much milder form than in the United States and Canada. Since the spring of 1959 a considerable acceleration in the rate of economic growth occurred. The average rate of growth in national product during the first eight months of 1959 was 5%, but for August alone it was 8%, and even higher figures were predicted for the remaining months of the year.

Cost of Living and National Income.—The cost-of-living index (1950 = 100) rose from 108 in 1954 to 119 in 1958. During the first half of 1959 the index remained stationary, but it then rose 1.1% in July and 1.8% in August. The national income increased from DM76,340 million in 1950 to DM169,100 million in 1958.

Industrial Production.—Among the Western nations the Federal Republic takes third place in industrial production after the United States and Great Britain. Output of major products in 1958 (in thousands of metric tons) was as follows: hard coal, 133,000; soft coal, 93,000; pig iron, 16,659; crude steel, 22,261. The monthly average index of electric power production (1936 = 100) rose to 446 in 1958, from 436 in 1957. The automotive industry in 1958 produced 1,306,854 passenger cars, 181,395 trucks and tractors, and 7,007 buses. Of the total of 1,495,256 motor vehicles, 49% were exported in 1958.

Industrial production increased in 1959, although the labor shortage created certain limitations. The building industry could not find 61,000 additional workers needed during the summer season, and was expected to achieve only a 5% increase of production over 1958. The expansion was greatest in primary production (up 14% in August 1959 over August 1958) such as the chemical, rubber, and nonferrous metal industries, and particularly in steel production, which was 10% higher in June, 14% in July, and 20% in August 1959 than in the same months of 1958. Alone among the major industries, coal mining showed a decline of 5% in August 1959, compared with August 1958. The decline is the result of the growing use of oil and has led to the layoff of miners. To alleviate the coal crisis and finance the orderly transfer of miners to other trades, the government has imposed a temporary tax on oil.

Foreign Trade.—West Germany was again in 1958 the third largest Western trading country after the United States and Britain. In 1958, West German exports almost equaled the value of British exports, and accounted for 9.2% of total world exports; West Germany topped Britain for the first time in the export of manufactures, accounting for 18.6% of the world total. West German (without the Saar and including West Berlin) exports in 1958 amounted to DM36,998 million; imports, DM31,133 million. In the first half of 1959, exports were valued at DM19,732 million, and imports, DM16,961 million. Chief exports are metallic manufactured goods (33.2% of total 1958 exports), transportation equipment (16%), base metals and chemicals (10.8% each), fuel (6.7%), and textiles (3.4%). Principal imports include raw materials (26.1% of 1958 imports), foodstuffs (26%), fuel (10.4%), base metals (9.9%), chemicals (3.6%), and transportation equipment (2.3%).

In 1958 the principal markets and sources of supply (with percentage of total imports quoted first, followed by exports in parentheses) were as follows: European Common Market (France, Italy, Benelux countries), 27.1% (28.1%); European Free Trade Association, or Outer Seven (Britain, Norway, Denmark, Sweden, Switzerland, Austria, Portugal), 26.7% (32.3%); eastern Europe, 3.8% (3.1%); other European countries, 3.5% (3.5%); United States, 13.6% (7.3%); the sterling area (excluding Britain), 6.7% (8.2%); Canada, 3.1% (1.2%); Latin America, 10.2% (8%); and the rest of the world, 5.3% (8.3%). The United States is the largest single supplier and has a large export-import balance in its favor.

Agriculture.—In spite of the high urbanization, about 87% of the land is used for agriculture and forestry. West German agriculture produces about three quarters of the nationally needed food. Agriculture and forestry contributed DM13.5 billion to the national income in 1958, or 0.7 billion more than in 1957. The agricultural program, or so-called "Green Plan," for 1959–60—the fourth passed by the Bundestag for the implementation of a long-range project for the improvement of the structure of agriculture and of its income level—provided for an expenditure of DM1,341 million, the same amount as in 1958–59.

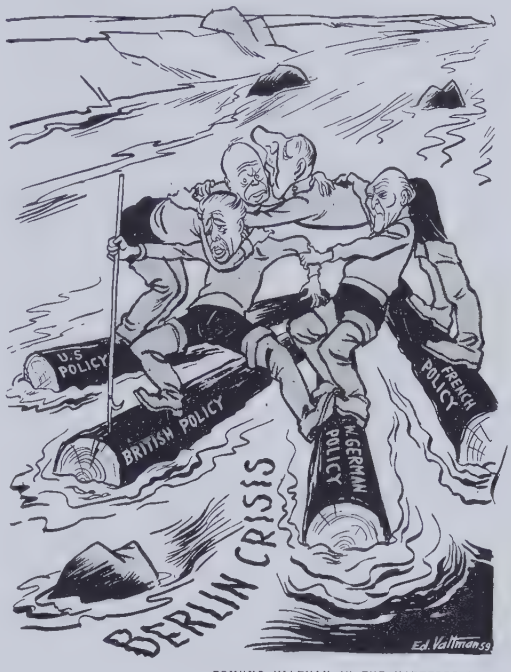
Employment and Wages.—The total number of gainfully employed persons rose from 19,673,024 on Sept. 30, 1957, to 20,034,512 on Sept. 30, 1958,

and to 20,198,800 on Sept. 30, 1959. The number of unemployed had fallen by Aug. 31, 1959, to 196,349, or less than 1% of the national labor force. This figure must contain a large percentage of unemployables and workers on short intermission between jobs. The demand for many categories of skilled workers cannot be filled. In August 1959, 350,400 job vacancies (in 1958, 264,400) were reported to the labor offices. By June 1959 about 14 million wage and salary workers worked less than 48 hours a week; three fourths of them were on a 5-day schedule, and about 4 million workers worked less than 45 hours per week. Average wage earnings rose from DM1.63 per hour in 1953 to DM2.32 per hour in 1958. The Federation of German Trade Unions, the largest labor organization, had by Sept. 30, 1958, a membership of 6,331,735, of whom 1,089,527 were women. The second largest labor organization is the German Union of Office Employees, with 438,142 members, among them 152,238 women.

Transportation and Communications.—West Germany has 24,607 miles of railroads, of which 19,263 are operated by the federal government. There are 81,733 miles of highways and roads, including 15,160 miles of superhighways (*Autobahnen*) and 1,398 miles of federal roads. There are 2,736 miles of navigable inland waterways. The German merchant fleet consisted at the end of 1958 of 2,736 merchant vessels totaling 4.44 million registered tons, a 14.3% increase over 1957. The German Lufthansa in 1958 transported 3.5 million persons, or 16.7% more than in 1957. (See also AERONAUTICS.) On Jan. 1, 1959, the number of registered motor vehicles (excluding the Saar and West Berlin) included 3.2 million passenger cars, 2 million motorcycles, 650,000 trucks, and 30,000 buses. At the same time there were registered in West Germany and West Berlin 15.5 million radio and 2.7 million television sets, as well as 5 million telephones.

WEST BERLIN

Political Events.—The Soviet note of Nov. 27, 1958, which declared that the USSR would not tolerate the presence of Western troops in West Berlin for more than another six months, and proposed to establish West Berlin as a "free city," was received with extraordinary calm by the population. Very few people have moved since then to West Germany, and the withdrawal of savings from the banks has been negligible.



EDMUND VALTMAN IN THE HARTFORD TIMES

"IN UNITY THERE IS STRENGTH"

On Dec. 7, 1958, 93.7% of all eligible voters went to the polls to elect a new West Berlin Parliament. The Social Democratic Party (SPD) received 52.29% of the total vote; the Christian Democratic Union (CDU), 37.9%; the Free Democratic Party (FDP), 3.8%; the German Party (DP), 3.36%; and the Socialist Union Party (SED; the cover name of the East German Communist Party), 1.96%. A coalition of SPD and CDU members under Mayor Willy Brandt (SPD) continued in office as the city government.

In February 1959, Mayor Brandt visited Washington for conversations with President Eisenhower and members of the State Department. He subsequently gave the main address at the Lincoln Sesquicentennial Memorial banquet at Springfield, Ill., on February 12. The mayor also visited Canada, Japan, and India.

(*Left*) Soviet Premier Nikita Khrushchev samples food at a dinner given in his honor at East Berlin's City Hall on March 8; Otto Grotewohl, East German premier, is at left, and Walter Ulbricht, head of East German Communist Party, at right. (*Right*) Soviet and East German Communist leaders address a rally in East Berlin celebrating East Germany's 10th anniversary on October 7. Behind the stand is the new East German flag, with hammer and calipers superimposed on the state colors.

WIDE WORLD

The people of West Berlin received assurances of support from the free world on many occasions in 1959. On the tenth anniversary of the ending of the Russian blockade of Berlin on May 12, 1959, Lucius D. Clay, United States military governor at the time of the blockade, spoke and brought a message from former President Truman. General Tunner, the commander of the Allied task force that operated the Berlin airlift, and former pilots of the force were present, as were France's Robert Schumann and Britain's Lord Attlee. On July 25, Secretary of State Christian Herter flew from Geneva to Berlin to name a street in memory of John Foster Dulles. He was received with tremendous popular enthusiasm. In a speech at the city hall he gave assurances that the United States and the two other Western nations responsible for West Berlin would not allow their clear rights in Berlin to be terminated by unilateral Russian action. At the Western summit meeting held in Paris on Dec. 19–21, 1959, the presidents of the United States and of the French Republic, the prime minister of the United Kingdom, and Chancellor Adenauer reaffirmed the principles set forth in the Four Power communiqué of Dec. 14, 1958, and in the NATO Council declaration of Dec. 16, 1958.

Economy.—The postwar recovery and development of West Berlin has been slower and more limited than that of West Germany. The city's industrial production index (1936 = 100) was 32 in 1950 (as compared with 109 in West Germany), 119 in 1958 (237), and 127 in the first half of 1959 (243). West Berlin has received (originally from the United States and in recent years chiefly from the Federal Republic) considerable funds to overcome high transportation costs resulting from the city's location 100 miles within the territory of East Germany.

West German industrialists took the initiative in late 1958 to raise the turnover of Berlin industries by DM500 million. By the placement of orders, which was later facilitated by special turnover tax exemptions and delivery guaranties of the Bonn government, four fifths of the desired result was actually achieved within the first half of 1959. The real impact of the long-term orders, however, will not be apparent for several months. Altogether, the industries of West Berlin achieved a turnover of DM3.31 billion in the first half of 1959, a 12% increase over 1958. In June 1959 there were 894,000 gainfully employed workers, and by the end of July there were 17,000 fewer unemployed workers than in July 1958. Unemployment dropped to a low of 4.6% of the available labor force for the first time in West Berlin's postwar history.

German Democratic Republic (East Germany)

Political Developments.—The German Democratic Republic (DDR), created by the Soviet military government in 1949 without democratic consultation or confirmation, follows the general pattern of a Communist people's democracy. Walter Ulbricht, the secretary of the Central Committee of the East German Socialist Unity (Communist) Party (SED) and deputy prime minister, has been the actual ruler of the state in the ten years of its existence, and has managed to maintain himself in the good graces of Khrushchev as much as of Stalin. It is obvious that this totalitarian police state would collapse if the Soviet support in the form of 20 Russian divisions were to be withdrawn. The steady flight of East Germans to the West can be taken as "a plebiscite by feet"; during its ten years' existence the country has lost 2,300,000 citizens to the West, including 204,000 in 1958 and 74,337 in the first half of 1959.

West Berlin, a "show window of the West" in the center of the DDR, constitutes a serious annoyance to the East German Communists. The removal of the Western powers from Berlin, the recognition of the DDR by the West, and an opportunity for Communist infiltration of West Germany have been the major aims of Soviet policy. Recognition of the East German state was demanded by Soviet Foreign Minister Andrei Gromyko at the Geneva conference of the Big Four foreign ministers in May 1959, and although the western ministers kept the East German delegation, led by Foreign Minister Lothar Bolz, away from the conference table, its presence in the conference room as an advisory group was considered a gain in prestige for the DDR.

The international activities of the German Democratic Republic, although greatly increased in 1958–59, failed to win its official recognition by any state outside the Eastern bloc. Contacts were established with Arab and African states, largely through offers of industrial deliveries. Great efforts to achieve diplomatic recognition from the Scandinavian states did not succeed.

The policy of full communization within the DDR and of the isolation of its people from Western influences led in 1959 to ever-growing pressure on the Christian churches and the clergy.

Economy.—Comparisons of East and West German economic developments are meaningless so long as they are based on money values, because a planned economy has no pricing system comparable to that of free economies. The budget (in East German Deutsche marks) for 1959 foresaw total revenues of DM45.88 billion (42.06 in 1958) and total expenditures of 42.90 billion (39.43). The figures contained, in contrast to those of the Federal Republic, the whole budget of the nationalized industries, as well as of social insurance, while the major part of military expenditures was hidden. Moreover, the value of the East German Deutsche mark, which is officially quoted as equal to the West German Deutsche mark, is sold on the free exchange at a quarter of the latter's value.

It is more meaningful to compare the quantitative output of East and West Germany. Largely due to the huge reparations taken by the Soviet Union, the general index of national productivity (1936 = 100) of the Democratic Republic in 1950 was only 78.5, compared with 110.3 for the Federal Republic. In 1954 the index figure of 105.9 (Federal Republic, 161.5) was for the first time slightly better than in the prewar period, and in 1957 it reached 121.7 (Federal Republic, 206.4). The differences in individual branches of production have been very considerable. Agricultural output is still behind 1936 production, but industrial production has risen sharply since 1950. In mining and power production the rate of increase has been relatively greater than in the West. The building industry reached prewar production only in 1956, when it was 100% greater than in 1936 in the Federal Republic. Production of consumer goods per capita in 1957 was about 25% under the 1936 level.

The value of industrial production in 1958 increased by 10.7%, to DM60 billion. According to official statistics, exports rose in 1958 to 7,562 million rubles (1957: 7,243 million); imports, to 6,740 million (1957: 6,462 million). The plan for 1959 called for exports valued at 8,400 rubles and for imports totaling 7,400 rubles. Trade between East and West Germany increased by 4% in 1958, but much greater was the increase in exports to Africa (54%) and the United Arab Republic (62%). East Germany's major trading partner is the Soviet Union, which in 1958 received East German exports totaling 5,600 million rubles.

As the second largest industrial member of the Soviet bloc's Council for Mutual Economic Assistance, East Germany is supposed to make important contributions to the coordinated economic planning of the European Communist countries.

On the eve of the tenth anniversary of the Democratic Republic, Walter Ulbricht announced (Oct. 7, 1959) the new Seven-Year Plan for 1959–65. The chief goal is to catch up and outdo West Germany in the productivity of labor. The per capita use of most consumer goods is supposed to top that of West Germany by 1961. East Germany's economy is capable of expansion, but probably not to the extent of the new plan. One of the bottlenecks of East German development lies in the labor shortage, which is enhanced by the continuing flight of its citizens to West Germany, among them an unusually high percentage of professional people and skilled workers.

Armed Forces.—The strength of the East German Army in 1959 was estimated at 110,000 men; in addition, there are about 70,000 members of frontier and special police, and 250,000 in so-called workers' combat groups. However, the real military power in East Germany consists of about 400,000 Soviet soldiers. As of Jan. 1, 1959, the Democratic Republic was no longer required to contribute to the maintenance of Soviet troops on its territory.

GERONTOLOGY. See OLD AGE.

GHANA. The first self-governing African nation within the Commonwealth of Nations (since March 6, 1957), this former British colony (the Gold Coast) and United Nations trusteeship (British Togoland) is situated on the Gulf of Guinea and is bordered by the republics of Ivory Coast and Upper Volta, and French Togoland. Area, 91,843 square miles. The population (mid-1958 est.) of 4,836,000 is predominantly Negro, and the Akan is the largest of numerous tribes. The capital is Accra (pop. est., 200,000); other principal towns are Kumasi (78,000), Takoradi (45,000), and Cape Coast (23,100).

Government.—The governor general of Ghana is the Earl of Listowel (appointed in 1957). Political power is held by Prime Minister Kwame Nkrumah, head of the Convention People's Party. In 1959 this party controlled 86 seats in the 104-member National Assembly, which is elected on the basis of universal adult suffrage and the secret ballot, and represents 97 rural and 7 municipal electoral districts. The cabinet was reorganized in 1959 to include the new ministries of Education and Information, Health and Social Welfare, and Commerce and Industry. Advisory powers on the local government level are exercised by a House of Chiefs and a Regional Assembly in each of 5 regions (Eastern, Western, Northern, Ashanti, and Trans-Volta Togoland).

Education and Religion.—Ghana's educational system in 1957 included 3,571 primary schools (with 467,961 pupils); 1,131 middle schools (127,517); and 60 secondary schools (12,119). There were also 30 teacher-training schools (3,873 students), 4 government technical institutes and 4 government trade schools (aggregating 2,710 students), and 38 private technical and trade schools. Mission schools in the Volta region, taken over by the government in 1958, were returned to church control in December 1959. The University College of Ghana enrolled 317 students, and the Kumasi College of Technology, 610. The first school of journalism in Africa was opened at Accra in 1959, and a new Academy of Learning was inaugurated at Accra on Nov. 27, 1959. The prevailing religion is fetishism, but there are large numbers of Christians.

Finance.—Government revenues for 1958–59 were estimated at G£48.5 million; expenditures, G£47.0 million. The Ghana pound is equal to the British pound, and G£1 equals U.S.$2.80. The new Ghana currency in circulation by the end of 1958 totaled G£27,568,140, and the old currency issued by the West African Currency Board was withdrawn as legal tender on July 1, 1959. Expenditure under the government's Second Five-Year Development Plan for 1959–64 was estimated at G£342 million, including G£100 million for hydroelectric power; G£28 million for communications; G£19 million for health, sanitation, and water supply; G£14 million each for education and for industry and trade; and G£10 million for agriculture and natural resources.

Transportation.—The road system aggregates about 15,000 miles, including 1,360 miles of bitumen-surfaced highways and 8,000 miles of secondary roads. The important 285-mile coastal highway from Takoradi, the chief port, to the Togoland border is being improved, and a hard-surfaced highway connecting southern Ghana with the Trans-Volta Togoland region was completed in 1958. Railways total only 767 miles. Ghana Airways, inaugurated in 1958, supplies both domestic and international air services. Construction continued in 1959 on the new harbor at Tema, 15 miles east of Accra.

Economy.—Ghana's average per capita annual income of G£57 ($160) is considered high for western Africa. The economy is largely dependent on the production of cocoa, and Ghana is the world's largest cocoa producer. The 1958–59 cocoa crop was estimated at over 250,000 tons, as compared with 264,375 tons in 1957–58. However, depressed cocoa prices during 1959 adversely affected the economy. Other crops include palm kernels (8,100 metric tons exported in 1958), rice, tobacco, coffee, bananas, and rubber.

Mineral production is second in economic importance. Exportable output of gold in 1958 was valued at G£10.6 million, a record high; diamonds, G£8.6 million; manganese, G£8.6 million; and bauxite, G£95,808. Timber exports totaled G£7.9 million in 1958. Livestock raising and fishing are important for subsistence. Manufacturing is a minor industry, but the government is fostering industrial development through the Second Five-Year Development Plan (see below, *Principal Events*).

Foreign Trade.—In 1958, Ghana's exports totaled G£104.6 million (up 14% over 1957); imports, G£84.6 million (down 14% from 1957). Cocoa accounts for over half of all export value, and minerals supply one fourth of the total. Chief imports are textiles, foods, machinery, fuels, and vehicles. Ghana's principal trading partner is the United Kingdom, which in 1958 accounted for about 35% of total foreign trade; the United States followed with about 14%.

Principal Events, 1959.—During the year the government continued to enforce strong measures against alleged subversion. New treason and subversion laws promulgated in June included a provision for sentencing anyone who makes a false statement about Ghana or the government to a jail sentence of up to 15 years. Under this law, libel proceedings were instituted against a leader of the opposition United Party, Dr. K. A. Busia, who reportedly said in London on June 29 that Ghana "was rapidly becoming a dictatorship." Dr. Busia's parliamentary seat was taken from him in July. Two other opposition members were unseated in April for having been arrested in December 1958 and charged with conspiracy to assassinate the prime minister and to overthrow the government. Under the Preventive Detention Act of 1958 which permits the government to jail for five years without trial anyone suspected of endangering the security of the state, 45 persons had been imprisoned by November 1959.

The government began work on constitutional changes in preparation for the conversion of Ghana to a republican system of government in early 1960. The Ministers of Ghana Bill, approved by the National Assembly on November 4, granted the prime minister greater powers in regard to cabinet administration.

Prime Minister Nkrumah and President Sékou Touré of Guinea signed an agreement on May 1 at Conakry, Guinea, to enlarge the Ghana-Guinea federal union (first projected in November 1958) into a Union of Independent African States. Other African nations or federations "adhering to the principles on which the union is based" were invited to join. Nkrumah and Touré met with Liberian President Tubman at Sanoquelli, Liberia, on July 16–19, and agreed to invite all independent African nations and those scheduled to receive independence to a conference in 1960 aimed at establishing a "Community of African States."

During an official visit on August 10–14 to the United Kingdom, Dr. Nkrumah was appointed a privy councillor by Queen Elizabeth II. The queen postponed a tour of Ghana scheduled for the fall, but Prince Philip paid a week's visit to the country in late November.

Preliminary work began in April on the long-projected Volta River Dam and hydroelectric plant, which is intended to play a large part in the industrialization of Ghana under the Second Five-Year Development Plan. Ghana has sought partial financing from the United States and its special lending agencies for this project, which will cost an estimated $300 million and produce over 1 million kilowatts annually. The first stage of the 5-year construction project involves the building of a multipurpose dam and power plant at Kosombo (60 miles northeast of Accra), and of a smelter at Tema for processing treated bauxite into aluminum.

W. R. F.

GIBRALTAR. Commanding the western entrance to the Mediterranean Sea, Gibraltar consists prin-

cipally of a long, high mountain called the Rock, rising 1,408 feet above sea level, with a deep Admiralty harbor of 440 acres at the base. A crown colony (Britain's smallest), it is connected to Spain on the north by a narrow peninsula; the total area is 2¼ square miles. The net tonnage of vessels calling in 1958 was 9,741,250. Since 1955 the fortress has been a subcommand of North Atlantic Treaty Organization naval and air forces. The civilian population was estimated at 25,637 in 1958.

A governor (from 1958, Gen. Sir Charles F. Keightley) is assisted by an 8-member Executive Council, and there is a 12-member Legislative Council presided over by an independent speaker. Revenue in 1958 totaled £1,463,236; expenditure, £1,452,853. In 1958 there were 7 secondary schools (1,608 students) and 18 kindergarten and primary schools (2,977 pupils).

Private industry is confined to fish and fruit canning and the processing of tobacco, coffee, macaroni, and confectionery for local consumption. Besides 6,000 British workers, the labor force in 1959 included 7,847 men and 3,549 women employed in the dockyards, factories, business houses, and private households, who enter and leave Gibraltar daily from Spain. Exports (including reexports) were valued at £2,829,292 in 1958; imports (principally from the United Kingdom), at £9,925,482. Highways aggregate 17 miles. British European Airways provides daily services to Tangier and London. The annual trade turnover from passing ships and visitors (225,000 in 1958) is equivalent to about $112 million.

GOLD. World production of gold increased for the fifth successive year in 1958, to a total of 40.4 million fine (troy) ounces valued at $1.41 billion, according to the U.S. Bureau of Mines. The gain in production over 1957 amounted to 2%.

Output of gold in the United States totaled 1,759,000 fine ounces in 1958, compared with 1,793,597 in 1957. South Dakota, Utah, Alaska, and California produced about 72% of domestic production. Except for the war years 1944–46, this was the lowest output since 1895. Although domestic output from straight gold mines increased, the gain was more than offset by the drop in the output of byproduct gold from copper and other base metal mines. In the first nine months of 1959, gold output was 1,391,095 ounces, an increase as compared with the 1,223,135 ounces produced in the same period of 1958.

Canada.—Production of gold in Canada in the first seven months of 1959 was 2,606,777 ounces, compared with 2,650,237 ounces in the corresponding 1958 period.

Union of South Africa.—In the first nine months of 1959, gold output was 14,894,979 ounces valued at $519,818,576.

GOVERNMENT PRINTING OFFICE. The largest and best-equipped printing plant in the world, the Government Printing Office produces printing and binding for Congress and the departments, independent establishments, and agencies of the federal government; furnishes blank paper, inks, and similar supplies to all governmental agencies; distributes government publications as required by law; and prints, for sale to the public, such documents as are not of a confidential nature.

During the fiscal year 1959, the Government Printing Office employed 6,565 persons and had a payroll amounting to $36,066,952.29. The office made charges in that fiscal year for 663,639,645 copies of publications of all classes, including 6,141,528 copies of the *Congressional Record;* 3,527,214 copies of the *Federal Register;* 8,082,188 copies of specifications of patents, trademarks, designs, etc.; and 360,830 copies of the *Patent Office Official Gazette*. The number of postal cards printed amounted to 3,098,864,000. The Division of Public Documents mailed approximately 141,400,000 publications; receipts from the sale of government publications were approximately $6,886,000. Total charges to Congress and government agencies during the fiscal year 1959 were $90,728,052.47.

RAYMOND BLATTENBERGER,
Public Printer.

GRAINS. Feed grain production in the United States continued its record-breaking trend in 1959, but output of food grains dropped a fifth below the 1958 peak. A huge corn crop, a record output by a large margin, was responsible for the increase in feed grain production. The barley and grain sorghum crops, though far above average, fell short of 1958 production, and the oats crop was the smallest in 20 years. Total output of the four feed grains was estimated by the Agricultural Marketing Service of the U.S. Department of Agriculture at 165.6 million tons, 5% above 1958.

The 1959 wheat crop declined about a fourth from 1958. Rye was down a third, but near average, and the buckwheat crop dropped a fourth. Rice production rose a fifth above 1958. Total output of the food grains was 37.1 million tons.

Large carry-over stocks from preceding crops boosted the total wheat supply for the 1959–60 marketing year to a new record, despite lower production. The 1959 carry-over of 1,277 million bushels was 396 million above 1958, and it exceeded the 1959 crop. Although livestock numbers increased and feeding was at a high rate, stocks of feed grains increased 8 million tons over 1958 to a record 67.4 million tons in 1959. Rice stocks, on the other hand, were reduced by large exports—to 15.7 million cwt.—compared with 18.2 million in 1958 and the record 34.6 million in 1956.

Most of the grain stocks accumulated in recent years have been acquired by the Commodity Credit Corporation under the price-support program. On Oct. 31, 1959, the corporation's inventory included 1,125 million bushels of wheat, 1,235 million bushels of corn, 77 million bushels of barley, 25.5 million bushels of oats, and 272.5 million bushels of grain sorghum. Additional quantities were under loan.

World grain production in 1959 generally declined from 1958, but remained high as compared with other years. Corn set a new record but production of barley, oats, rice, wheat, and rye declined.

Wheat.—United States production was 1,128,151,000 bushels in 1959, a fourth below the record 1958 crop but 5% above the 1948–57 average.

[1] Preliminary estimates for Northern Hemisphere countries; for Southern Hemisphere, preliminary forecasts based largely on acreage and weather conditions. Years shown refer to years of harvest in Northern Hemisphere; harvests of Northern Hemisphere are combined with those of the Southern Hemisphere which follow. [2] Average is for the crop years 1950–51 to 1954–55; figures are in million pounds. (Source: Foreign Agricultural Service, U.S. Department of Agriculture.)

Grain was harvested from 53,024,000 acres, which was slightly less than in 1958 and 13% less than the 1948–57 average. Although the average yield of 21.3 bushels per acre was below the 1958 peak of 27.4 bushels, it was the third highest yield on record. The 1959 crop comprised 923,449,000 bushels of winter wheat and 204,702,000 bushels of spring wheat, including 20,682,000 bushels of durum wheat.

The 1959–60 world crop was estimated by the Foreign Agricultural Service at 8,065 million bushels, down from 8,705 million in 1958–59, but well above the 1950–54 average of 6,980 million.

Rice.—United States output in 1959 rose a fifth above 1950 and 11% above the 1948–57 average to 53,122,000 cwt. Acreage increased as the result of the end of the acreage reserve program of the soil bank, though the crop was grown under acreage allotments. The 1,586,100 acres harvested was 12% more than in 1958. Yields averaged a record 3,349 pounds per acre.

The world rice crop in 1959–60 was reduced by a drop in production in China, which usually accounts for a third of the total, to 471 billion pounds, compared with 480 billion in 1958–59 and the average 396 billion in 1950–54.

Rye.—A below-average crop was harvested in the United States in 1959. Production of 21,495,000 bushels was 10.6 million less than in 1958 and 1 million below average. Fewer acres were harvested than in 1958 and the average yield of 15.1 bushels per acre represented a decline of 3 bushels.

World production in 1959–60 was estimated at 1,405 million bushels, or 55 million less than in 1958–59, and 50 million below the 1950–54 average.

Buckwheat.—This crop has been rapidly declining in importance in the United States. The 1959 output of 1,368,000 bushels was 23% less than in 1958 and 59% less than the 1948–57 average.

Corn.—Production in the United States rose 15% above the 1958 record to 4,361,170,000 bushels in 1959. The gain was due to an 11 million-acre increase in acreage to 84,609,000, mainly because of the removal of acreage allotments in the commercial corn area. Yields were high, with the average of 51.5 bushels per acre slightly below the 1958 record but 27% above average. The 1959 crop included 3,989 million bushels of grain and 59.7 million tons of silage.

The United States produced well over half of the record world crop totaling 7,710 million bushels in 1959–60, or 5% more than in the preceding year. Record crops were harvested in Yugoslavia and Rumania, but the crop in the Soviet Union was down sharply from the 1958 peak.

Oats.—The smallest crop since 1939 was harvested in the United States in 1959. Production was 1,073,982,000 bushels, or 24% below 1959. The 28,496,000 acres harvested was the fewest since 1892, and the average yield of 37.7 bushels per acre was 7 bushels below the 1958 record.

World oats production in 1959–60 dropped 13% from 1958–59 and 11% from the 1950–54 average to 3,700 million bushels. Most of the decrease occurred in the United States.

Barley.—The 1959 crop in the United States was 420,191,000 bushels—a decline of 12% below the 1958 record but 32% above the average output. Acreage harvested totaled 15,074,000 acres, slightly above 1958, but the average yield of 27.9 bushels per acre was 3.9 bushels lower.

World barley production of 3,240 million bushels in 1959–60 was 2% below the preceding year but a fifth above the 1950–54 average.

Sorghum Grain.—This crop has been increasing recently in importance in the United States, and the 1959 crop of 579,178,000 bushels was the third to exceed half a billion. Average yields rose slightly over 1958 to a record 37.2 bushels per acre, but the 15,575,000 acres harvested for grain

was 7% less than in 1958. (See also AGRICULTURE.)

GRAPHIC ARTS. An important milestone in graphic arts in 1959 was the Seventh Educational Graphic Arts Exposition, held September 6–12, in the Coliseum, New York City. Here in actual operation were the various phototypesetters, the small multicolor offset and letterpresses, the electronic engravers, the powderless etching machines, bindery equipment, and many types of miscellaneous equipment. Especially noticeable were the new names among exhibitors and equipment which have appeared since the 1950 exposition. Japanese imports, particularly photomechanical items, will now be competing with the more familiar products from Germany and other countries.

Concurrently, another exhibition under private management, called SPECTRA, was held in the New York Trade Show building, and many companies which were unable to obtain space at the Coliseum exhibited there.

The most unusual product of 1959 was the "talking-printing process" from Japan. This process prints conventional type and halftones on one side of the sheet, and magnetic recordings on the reverse side. It is reported that one of these printed sheets, placed in an electronic reading device, will reproduce voice or sound. When perfected, the process should be helpful to students of language and to blind people.

A long-talked-about method for letterpress printing was introduced in 1959 by Harris-Intertype Corporation. This is a rotary letterpress using relatively thin, wrap-around plates, having a shallow relief etch. Plates are .024 to .034 inch thick, with a relief depth of .010 to .012 inch. Powderless etching processes can be used on zinc, magnesium, or copper plates. The first model is a single-color, 23-by-30-inch sheet-fed press with speeds up to 7,500 sheets per hour, which is 50% to 100% faster than flat-bed presses. A similar rotary press for wrap-around plates was introduced by Miehle-Goss-Dexter, Inc.

Numerous advantages are claimed for plastic-backed electrotypes, which were developed further in 1959. Such plates use a standard electrotype shell with backing of special plastic instead of the usual lead, providing an 85% reduction in weight. Fewer operations are required to process a plate, and the backing material may be shaved, beveled, or routed as easily as lead.

Magnetic ink character printing has been approved by the American Bankers Association as standard for automatic check processing. The adoption of magnetic ink character printing by the association permits banks to sort and post checks automatically with electronic equipment. The digits and symbols have been designed to be read visually or by special reading devices. The inks used are capable of being magnetized so that each character will provide the proper impulse for the "reader."

The new photopolymer plate, introduced in 1957 by Du Pont, has been named Dycril and was being offered in 1959 on a commercial basis to a limited extent. A Dycril plate is formed from a light-sensitive plastic, a bonding layer, and a metal support. Exposed to ultraviolet light through a high-contrast photographic negative, the exposed plastic becomes relatively insoluble. Unexposed plastic is then removed by pressurized spray of alkaline solution, leaving printing areas in relief. No acid or etching in the ordinary sense is used. With a high-contrast negative in hand, a Dycril plate may be produced in approximately 20 minutes.

Another answer to the perennial problem of dampening plates on offset presses is the Dahlgren Dampening System. Based on an old principle of feeding water into the inking unit (contrary to conventional practice), some basic improvements have been made by Dahlgren. Molleton-covered rollers in the normal dampening system are eliminated, and water is applied to the first ink roller rather than to the offset plate. Advantages of the system are claimed to be: less lint and "hickies," no roller covers necessary, no change of dampener rollers for different colors, fewer adjustments, less water required, less emulsification of ink, better color, and faster "getaways."

Packless mats for sterotype plates are comparatively new for newspapers, but successful experiments in 1959 seem to indicate their wider use in the future.

A typographic roller named Koraltone, made from a new plastic material, is practical and economical for corrugated box presses. The roller is coral in color, tough, and bonded with the core to assure stability for a long period.

A new process known as FluoroColor is an economical method of preparing and reproducing full-color art work. Applicable to all the processes, it eliminates color separation and re-etching, cutting costs by 50% for some types of work. It is similar to the earlier fluorescence process of the Eastman Kodak Company, in that special art materials are used by the artist in preparing material. Colors are preseparated by the artist on three transparent overlays of Du Pont's Mylar. The fluorescent paints under ultraviolet light automatically drop out halftone dots in highlights and background.

From France comes a new method of producing colorful retail cartons from poor grades of boxboard whose printing surface would normally be unacceptable. In this method, the carton design is printed on the underside of transparent material, usually glassine, which is then laminated to the cardboard. The whole operation is performed on a special press, with paper and cardboard fed from a roll; printing, gluing, and laminating are continuous. Similar processes are in use in the United States.

An item of interest to large-edition book printers is an auxiliary device for large sheet-fed rotaries, known as a Websheet feeder. It consists of a roll stand which automatically cuts sheets to exact size and feeds them into the stream feed of the press. Since the mechanism does not interfere with the regular sheet feeder on the press, the printer can use either sheets or less costly rolls.

GREAT BRITAIN or **UNITED KINGDOM OF GREAT BRITAIN AND NORTHERN IRELAND.** A group of islands separated in the south by the English Channel from the northwest coast of Europe, the United Kingdom (94,504 square miles in area) is bounded on the north and west by the Atlantic Ocean and on the east by the North Sea. The main island, Great Britain, consists of England (50,337 square

EUROPEAN

Gloucestershire farmers gather bales of straw in the shadow of Britain's giant nuclear power station under construction since 1957 at Berkeley. Reactor at left is scheduled for operation early in 1961; the one at right, later that year.

miles), Wales (8,006 square miles), and Scotland (30,410 square miles). Northern Ireland (5,449 square miles), the Channel Islands (75 square miles), the Isle of Man (227 square miles), and about 500 lesser islands make up the remainder of the country.

Population.—The home population of the United Kingdom was estimated on June 30, 1958, at 51,680,000, including 45,109,000 in England and Wales, 5,169,000 in Scotland, and 1,402,000 in Northern Ireland. Estimated populations of principal cities at the same date were as follows: Greater London 8,222,340, including 3,225,000 in the County of London and 4,997,340 in the Outer Ring; Birmingham, 1,095,000; Glasgow (Jan. 1, 1958), 1,085,100; Liverpool, 762,400; Manchester, 676,900; Leeds, 510,600; and Sheffield, 498,800. The principal ports, in addition to London, Liverpool, Manchester, and Glasgow, are Bristol, 438,000; Belfast, 436,200; Hull, 301,100; Newcastle-upon-Tyne, 272,400; Cardiff, 253,300; and Southampton, 199,400.

Government.—The United Kingdom is a constitutional monarchy with an executive drawn from Parliament. Queen Elizabeth II (q.v.), the sovereign, acceded on Feb. 6, 1952. The heir apparent is Charles, Prince of Wales, son of the queen and her husband, Prince Philip, Duke of Edinburgh.

The executive consists of a cabinet led by a prime minister, which sits in and is responsible to the bicameral Parliament. The prime minister, who with his cabinet must command a majority in the 630-member elected House of Commons, conducts business in the sovereign's name. The normal life of Parliament is five years, but it may be dissolved at any time by the sovereign on the advice of the prime minister. Except for money bills, which must originate in the House of Commons, legislation may be initiated in either house. The House of Lords may delay any bills except money bills.

Chiefly a revisionary body, the basically hereditary House of Lords consisted of 893 members on Oct. 1, 1959, including the 2 archbishops and 24 of the bishops of the Church of England, 22 dukes, 27 marquesses, 132 earls, 105 viscounts, 560 barons and baronesses (including 10 life barons and 4 life baronesses), 16 representative peers for Scotland, 1 Irish representative peer, and judges given life peerages to carry out the House's function as the final court of appeal.

After the general election of Oct. 8, 1959, the House of Commons consisted of 365 Conservatives and supporters, 258 Labour and Cooperative Party members, 6 Liberals and 1 independent, a Conservative majority of 100 over all other parties, compared with a Conservative majority of 56 at the dissolution of Parliament on September 18. Harold Macmillan (q.v.) continued as prime minister, Selwyn Lloyd (q.v.) as foreign secretary, Richard Austen Butler as home secretary, and Derick Heathcoat Amory as chancellor of the exchequer after the election, but Harold Watkinson replaced Duncan Sandys as minister of defense, and Iain Macleod became colonial secretary; two new ministries, Science and Aviation, were established.

Finance.—In the financial year 1958–59 revenue amounted to £5,480 million (£1=U.S. $2.80), and expenditure to £5,103 million, giving a surplus of £377 million. Estimated revenue in the 1959–60 budget totaled £5,325 million and expenditure £5,223 million, including £1,514 million for defense; £219 million for education and broadcasting; £1,186 million for health, housing, and local government; £584 million for other social services; and £600 million for interest on the national debt.

In the first half of 1959, Great Britain's balance of payments showed a surplus of £142 million, and, as a result, British gold reserves rose by $103.6 million. A further rise of $112 million in the third quarter brought them to $3,284 million by October 1. There was, however, a decline of $260.4 million in October, due mainly to the repayment of $250 million, plus $5.5 million interest, drawn in October 1957 against an Export-Import Bank of Washington credit of $500 million granted in December 1956. This full repayment was made a year before the first semiannual repayment installment was due.

The balance-of-payments surplus of £142 million in the first half of 1959 compared with a revised figure of £237 million for the first half of 1958 and £23 million for the second half. The improvement over the second half of 1958 was due to a recovery in exports to the nonsterling world. The fall of £95 million in the current balance for the first half of 1959, compared with the first half of 1958, resulted from favorable factors being outweighed by others, including a rise in imports of £99 million. As a result of the improved financial position, a relaxation of the control of imports of processed foodstuffs and consumer goods from the dollar area was announced on May 28, 1959. On November 4, the ending of the system of import controls which had governed overseas supplies since the outbreak of war in 1939 was announced. As a result, the overwhelming majority of imports from all sources other than Japan, the Soviet bloc, and Communist China were freed from restrictions beginning November 9. Similarly, starting November 1, British travelers going abroad were allowed to purchase unlimited foreign currency.

Taxation.—The standard rate of income tax was reduced from 42½% to 38¾% in the 1959–60 budget. Two ninths of the first £4,005 of earned income and one ninth of the balance up to £9,945 are tax free. Single persons receive an exemption

of £140; a married couple, £240; and children, £100 to £150, according to age. Among other exemptions are incapacitated relatives, housekeepers, and persons over 65. Rates on the income taxed vary from 8¾% on the first £60 to the standard rate on income over £360. Surtax is levied at a rate rising from 10% on income over £2,000 (£2,100 for a married couple) to 50% on income over £15,000.

Corporations pay the standard rate on all income, plus a 10% profits tax. Other taxes include purchase taxes (lowered in the 1959–60 budget), stamp and estate duties, and entertainment taxes.

Defense.—A further report on the progress of the five-year defense plan, announced in April 1957, was contained in the annual defense white paper published on Feb. 10, 1959. Modernization of the Royal Navy included 4 guided missile ships, 3 new cruisers, and 44 frigates (half of them completed). Progress in the building of a nuclear submarine is being accelerated by the purchase of a propulsion unit from the United States. The strategic bomber force is being equipped with new and advanced aircraft, and rockets and ground-to-air missiles are being developed. By April 1, half of the planned reduction of 300,000 men in the strength of the armed forces had been achieved.

Compulsory military service, now between the ages of 18 and 26, which has been maintained in Britain since 1939, will cease in 1962. The estimated active strength of the armed forces on April 1, 1959, was as follows: Royal Navy, 101,500; army, 303,900; and Royal Air Force (RAF), 173,400. Included in these figures were 152,800 National Service men and 14,300 women.

In January 1959, the Royal Navy had 7 aircraft carriers, 1 battleship, 12 cruisers, 56 destroyers, 105 frigates, 48 submarines, 200 minesweepers, and 155 other vessels, including a guided missile experimental ship. A total of 3 carriers, 6 cruisers, 55 destroyers and frigates, and 36 submarines were to be kept fully operational in 1959–60.

Britain was to keep 55,000 men in Germany, including an army brigade group and a small RAF force in Berlin, until 1960, when a reduction to 45,000 was scheduled. Within Britain the army is divided into five commands and two districts; overseas commands include Middle East Land Forces, East Africa Command, Far East Land Forces, and the British Army of the Rhine. The RAF is organized into 8 home commands, and forces overseas include the 2d Tactical Air Force in Germany, the Middle East Air Force (headquarters, Cyprus), the Aden Command, and the Far East Air Force (headquarters, Changi, Singapore).

Atomic Energy.—Since Aug. 1, 1954, atomic research and development have been the responsibility of the United Kingdom Atomic Energy Authority (UKAEA). The authority is divided into three main groups: the Research Group, operating a research station at Harwell, Berkshire, and a radiochemical center at Amersham, Buckinghamshire; the Industrial Group, concerned with the production of atomic materials, centered at Risley, Lancashire, and with factories at Capenhurst, Cheshire; Windscale, Cumberland; and Calder Hall, Cumberland; an experimental station at Dounreay, Caithness; and laboratories at Springfields, Lancashire; Windscale; Capenhurst; Culcheth, Cheshire; and Dounreay; and the Weapons Group, with a research center at Aldermaston, Berkshire. A second research center for the Research Group at Winfrith Heath, Dorset, and a reactor center for the Industrial Group at Chapelcross, near Annan, Dumfriesshire, are under construction. In addition to the UKAEA stations at Calder Hall, Chapelcross, and Dounreay, which feed power into the national electricity grid, an electric power program, designed to produce 5 million to 6 million kw. of power by 1966–67 is under way, with nuclear stations being built at Bradwell, Essex; Berkeley, Gloucestershire; Hunterston, Ayrshire (all to be completed in 1961); Hinkley Point, Somerset (1962); and Trawsfynydd, Merioneth (1964).

On July 1, 1959, the Industrial Group was subdivided into a development and engineering group and a production group, responsible for the atomic factories, both with headquarters at Risley.

On February 4, an agreement providing for the opening of the markets of the members of the European Atomic Energy Agency (Euratom) to reactors developed in Britain was signed in London between Great Britain and Euratom. An amendment of the Anglo-American agreement of July 1958 on the uses of atomic energy for mutual defense purposes was signed on May 7.

Education.—All children between the ages of 5 and 15 in Great Britain and Northern Ireland must attend school. Direct expenditure from central government funds on education in 1959–60 was estimated at £122.6 million, to which must be added part of the general grant to local authorities of £448 million for England and Wales and £54.7 million for Scotland. Local authority expenditure was expected to be about £600 million.

There are 16 universities and 1 university college in England, 1 university in Wales, 4 universities in Scotland, and 1 in Northern Ireland. Government grants to universities in 1959–60 were estimated at £57,711,650. In 1957–58 university income totaled £49,418,302, of which £36,355,578 came from public funds. There were at British universities 95,442 full-time students, 79.2% of whom were assisted by scholarships or grants, and 16,486 part-time students. Included in the totals were 6,180 full-time and 2,208 part-time students from the Commonwealth and 3,982 full-time and 1,904 part-time students from foreign countries.

There were 7,532,326 pupils in 35,197 schools, with 301,283 teachers, in England and Wales on Jan. 1, 1958; 884,855 pupils in 3,293 schools, with 36,240 teachers, in Scotland in 1958; and 271,074 pupils in 1,785 schools, with 9,363 teachers, in Northern Ireland in 1957–58. A further 434,672 students in England and Wales and 242,634 in Scotland were undergoing part-time education in 1957–58.

A new building program for technical education, costing £54 million over the period 1961–64, was published on April 15, 1959.

Religion.—The established church is the Church of England, though it receives no payment except for services rendered. Its two provinces, Canterbury (29 dioceses) and York (14 dioceses), are headed by archbishops. Archbishops, bishops, and deans are appointed by the crown on the advice of the prime minister. The Church Assembly, set up in 1919, is the church's legislative body. While two thirds of the population are nominally Anglican, the estimated number on parish rolls in 1959 was 3,250,000. In 1958 the unestablished Church of Ireland had 354,000 members; the Episcopal Church in Scotland, 108,000; and the church in Wales, 200,000.

The established (Presbyterian) Church of Scotland had 1,320,000 members in 1958. There were 740,000 Methodists, 340,000 Congregationalists, 328,000 Baptists, and 4,500,000 Roman Catholics in the United Kingdom in 1958. The Jewish community (400,000) is the largest in Europe.

Social Services.—The state provides education and health services, housing, unemployment benefits, care of the aged and the handicapped, nutritional services for mothers and children, sickness and industrial injury benefits, old-age and widows' pensions, subsistence for the needy, and children's allowances. The funds by which these services are financed are derived from weekly contributions by employers and employees and local and national taxation. Expenditure on social services from the national budget in 1959–60 was expected to total £1,306 million, plus a proportion of the general grant to local authorities.

The National Health Service in England and Wales included 44,632,784 patients and 21,838 doctors on July 1, 1958. In Scotland there were 2,859 doctors at the end of 1958. Included also on Dec. 31, 1958, were 10,274 dentists and 8,059 opticians in England and Wales and 1,344 dentists and 900 opticians in Scotland. At the same

date there were 505,523 hospital beds and 193,685 nurses and midwives in England and Wales and 63,950 hospital beds in Scotland. Prescriptions dispensed in Great Britain in 1958 totaled approximately 223,785,000.

There were 3,480,000 families with approximately 9 million children receiving family allowances in Great Britain on June 1, 1959. On March 31, there were 5,340,000 retirement pensioners, 194,000 noncontributory old-age pensioners, 495,000 widows' pensioners, and 1,664,000 persons receiving national assistance grants. In 1958, 7,886,500 new claims for sickness benefits, 784,000 claims for injury benefits, and 3,364,800 claims for unemployment benefits were made.

Agriculture.—Because of bad weather, production in 1958–59 was slightly lower than in 1957–58, though still about 60% above the average for the pre-World War II period. A drought in the summer of 1959 made it unlikely that there would be any large improvement in 1959–60. Acreage and production figures are shown in Table 1.

Table 1—AGRICULTURAL PRODUCTION
(Years beginning June 1)

Crop	1957–58	1958–59
Acreages (thousands):		
Wheat and rye	2,139	2,231
Other grains	5,306	5,259
Potatoes	811	822
Sugar beets	430	439
All tillage	11,176	11,172
Production (thousand long tons):		
Wheat and rye	2,707	2,731
Other grains	5,427	5,593
Potatoes	5,691	5,556
Sugar beets	4,539	5,602
Milk (million gallons)	2,392	2,252
Eggs[1]	660	695
Beef and veal	887	783
Mutton and lamb	208	200
Pig meat[1]	690	726
Net agricultural output (1936–39 = 100):		
Agricultural holdings[2]	160	159
Total[1]	162	161

[1] Includes production from units under 1 acre. [2] Holdings of over 1 acre only.

Minerals.—The nationalized coal industry has been managed since 1947 by the National Coal Board. Coal production totaled 215.8 million long tons in 1958 and 134.4 million tons in the first 8 months of 1959. The average output per man-shift in 1958 was 1.26 tons overall and 3.52 tons at the coal face. In August 1959, 659,000 persons were employed in the coal industry. British refineries processed 32,932,800 long tons of crude and shale oil in 1958 and 22,664,500 tons in the first 7 months of 1959. Production of iron ore in 1958 amounted to 14,612,000 long tons.

Industrial Production.—Recovery in the fourth quarter of 1958 raised production for the year to about 1% below the 1957 level. This trend continued, and by June 1959 the index of industrial production was seven points higher than a year before. Though production of pig iron and steel were both lower than in 1958, when 19,750,000 and 13,000,000 long tons, respectively, had been produced, the output of both passenger cars, at a record figure of 573,796 units in the first 6 months, and aircraft were higher. In June 1959, the working population totaled 23,968,000, or 105,000 fewer than a year earlier. Of the total, 565,000 were in the armed forces and 23,020,000 in civilian employment. Wholly unemployed numbered 394,000 in June 1959, compared with 370,000 in June 1958. The output of selected industries is shown in Table 2.

Table 2—OUTPUT OF SELECTED INDUSTRIES

Commodity	1957	1958
Synthetic fibers:		
Staple fibers (million lbs.)	263.2	230.6
Continuous filament yarn (million lbs.)	232.6	191.5
Cotton and cotton waste yarn (million lbs.)	727.3	631.3
Spun rayon and mixture yarn (million lbs.)	149.3	151.5
Woven cotton cloth (million linear yards)	1,628.0	1,429.0
Woven synthetic fiber and mixture cloth (million linear yards)	659.5	601.0
Woolen and worsted yarn (million lbs.)	537.8	494.2
Woven woolen and worsted cloth (million square yards)	394.1	349.0
Merchant ships completed (thousand gross tons)	1,442	1,441
Metalworking machine tools (£ million)	95.3	83.9
Radio and television sets (thousands)	3,703.2	3,769.0
Passenger cars and chassis (thousands)	860.8	1,051.6
Commercial vehicles and chassis (thousands)	275.3	297.8

EUROPEAN

President Eisenhower, visiting Britain in August, meets Queen Elizabeth at Balmoral Castle, her summer residence.

External Trade.—Great Britain's balance of trade in 1958 showed a considerable improvement over 1957, mainly because of the fall in world commodity prices. The volume of imports was almost the same as in 1957, but their value (c.i.f.) decreased from £3,573 million to £3,309 million. Exports also fell, from £3,515 million (f.o.b.) to £3,429 million, but the result was a favorable balance of £120 million on visible exports, compared with a deficit of £58 million in 1957.

Exports to the dollar area were 3% higher in 1958 than in 1957, and those to the United States alone 15% higher. Exports to western Europe, on the other hand, were 7% lower, and those to the rest of the sterling area 3% lower. Imports from the dollar area fell by about £180 million, of which £60 million was attributable to a decline in petroleum imports. Imports from the rest of the nonsterling area were about the same, increased imports of manufactured goods offsetting a decline in imports of primary and semifinished products.

Exports of engineering products again rose in 1958, to form 43.6% of the total. Textile exports dropped to below 10% of the total, exports of chemicals declined by 2%, and those of iron and steel by 12%. Whiskey exports reached an all-time high of £56 million. Food imports were 1% higher in 1958 than in 1957; crude petroleum imports increased to £276 million, but refined petroleum decreased by £23 million to £130 million. Imports of basic materials declined by 22%, to £988 million, and imports of semimanufactures, at £587 million, were lower by £54 million. Imports of finished manufactures in 1958 increased by £35 million, to £322 million.

Exports in the first 9 months of 1959, at £2,421 million, were about 3% higher than in the same period of 1958, while imports, at £2,907 million, were 5% higher in value and 7% higher in volume. Re-exports were valued at £99 million, compared with £108 million in the corresponding period of 1958. Exports to the sterling area in the 9-month period were lower than in 1958, but, be-

cause of increases to western Europe and North America, those to nonsterling countries were higher by 5% in the first quarter and by 11% in the second and third quarters. Imports from the sterling area during the 9-month period were higher than in 1958, and imports from other areas increased by 4.5%. Imports of manufactures and fuel both increased by 13%, food imports rose by 2.5%, and those of basic materials were 5% higher in volume, though about the same in value. (See also INTERNATIONAL TRADE.)

Statistics of British trade in 1957 and 1958 are shown in Table 3.

Table 3—BRITAIN'S IMPORTS AND EXPORTS, 1957 AND 1958

	1957	1958
Principal Imports	(£ million, c.i.f.)	
Foods, beverages, and tobacco:		
Cereals and cereal preparations	211.4	225.7
Meat and meat preparations	308.3	314.5
Dairy produce	139.9	136.1
Sugar and sugar preparations	155.1	100.4
Fruits and vegetables	228.8	262.4
Tobacco	85.5	86.9
Materials and manufactures:		
Wood and cork	173.5	140.5
Raw cotton	108.4	71.6
Raw wool and other animal hair	205.2	145.4
Rubber (including synthetic and reclaimed)	84.6	76.2
Petroleum and petroleum products	440.1	433.7
Iron and steel manufactures	79.1	46.6
Nonferrous base metals and manufactures	191.8	174.9
Machinery (nonelectric)	124.9	136.8
Textile yarns and manufactures	89.1	84.9
Chemicals	114.3	119.8
Exports of British Products	(£ million, f.o.b.)	
Iron and steel	213.2	187.6
Nonferrous base metals	95.8	93.4
Road vehicles and aircraft	403.5	457.0
Machinery (nonelectric)	560.9	567.2
Electrical machinery, apparatus, and appliances	227.3	223.7
Chemicals	267.4	263.1
Textile yarns and manufactures	301.6	255.1
Metal manufactures	167.9	150.8
Ships and boats	79.3	63.1
Food, beverages, and tobacco	206.2	193.7
Coal, coke, etc.	61.8	32.7
Petroleum and petroleum products	90.9	100.5
Basic materials	123.0	109.0

Communications.—British railroads have been operated through the British Transport Commission, a public authority, since 1948. On Jan. 1, 1959, there were 50,942 miles of track in operation, and the commission owned 17,396 locomotives (16,108 steam), 46,040 passenger cars, and 1,020,197 freight cars. During 1958 the railroads carried 1,089,831,000 passengers and 242,873,000 tons of freight. British Road Services, a division of the commission operating long-distance road hauling services, owned 15,976 vehicles on Jan. 1, 1959, and there were 1.3 million privately owned trucks and 99,000 privately owned passenger-carrying vehicles in operation. In 1958 the railroads operated at a deficit of £48.1 million, while the operations of the commission as a whole showed a deficit of £89 million on gross receipts of £674,311,967.

British Overseas Airways Corporation, which has operated Britain's long-range air services since 1946, carried 495,170 passengers and 8,788 tons of freight in 1958–59. Revenue for the year totaled £58,401,855, giving an operating profit of £843,123. Services to Europe, operated by British European Airways Corporation, carried 2,828,715 passengers and 28,020 tons of freight in 1958–59, producing a revenue of £31,761,313 and a profit of £232,695. (See also AERONAUTICS.)

The British Broadcasting Corporation (BBC), a chartered public corporation that has a monopoly on sound broadcasting in the United Kingdom, employed 1 long-wave, 57 medium-wave, and 18 VHF radio transmitting stations and 22 television transmitters in 1959. In 1958–59 its income totaled £28,614,697, including £27,323,115 from license fees and £1,144,578 from publications. The Independent Television Authority (ITA), which telecasts programs under controlled sponsorship, operated 10 transmitters in 1959. Its income, derived from payments for programming, totaled £2,917,038 in 1958–59. On Sept. 1, 1959, there were 9,628,000 broadcast receiving licenses for television and 5,282,000 for sound only.

Overseas telecommunications services, operated by Cable and Wireless, Ltd., a public company indirectly controlled by the postmaster general, transmitted 423 million words and sold 2,103,000 minutes of radiotelephone time in 1958–59. The company's revenue amounted to £15,791,766, showing a profit of £3,366,981.

The British merchant fleet consisted of 19,693,000 tons of shipping, including 6,430,000 tons of tankers, on Sept. 1, 1959. In 1958, 100,764,000 tons of shipping in the foreign trade entered British ports, and 101,052,000 tons cleared them.

Principal Events, 1959.—Politically, the most important event of 1959 was the general election on October 8, which, after a series of opinion polls that showed decreasing Conservative sentiment, resulted in a victory for the Conservatives which almost doubled their majority in the House of Commons (see above *Government*). Among the most important legislation of the year were a Factories Act (July 29), which improved health, safety, and welfare provisions; and a Cotton Industry Act (July 9), which was intended to assist in the reorganization and re-equipment of the industry, with the aim of recapturing lost markets. The only major strike was a printing industry dispute (June 17–July 31). The Committee on the Working of the Monetary System, appointed in May 1957 with Baron Radcliffe of Werneth as chairman, reported on August 19. The report included no list of recommendations, but gave a detailed account of the day-to-day workings of the City of London, and advanced ideas on credit and monetary policy which aroused worldwide interest in financial circles.

Anglo-Soviet relations were dominated by the visit of Prime Minister Harold Macmillan and Foreign Secretary Selwyn Lloyd to the USSR from February 21 to March 3, when they discussed trade and cultural relations, disarmament, nuclear weapons tests, and Germany with Premier Nikita S. Khrushchev. Hugh Gaitskell, leader of the Labour Party, accompanied by Aneurin Bevan and Denis Healey, visited the Soviet Union from August 30 to September 9. An Anglo-Soviet trade agreement, providing for an exchange of consumer goods on a quota basis, was signed in Moscow on May 24, and an agreement on cultural exchanges was signed in London on December 1.

No solution was reached, however, at the foreign ministers' conference held in Geneva (May 11–June 20 and July 13–August 5), at which Foreign Secretary Lloyd represented Britain, to the problems of Germany and Berlin, and little progress was made on disarmament or on the banning of nuclear weapons tests either as a result of the meetings which continued throughout the year, or as a result of Lloyd's proposals to the U.N. General Assembly on September 17. (See also DISARMAMENT.) There was, however, general agreement on the desirability of a summit meeting, and Britain showed some sympathy with the French attitude and President Charles de Gaulle's wish to see Premier Khrushchev before such a meeting took place. Prime Minister Macmillan attended the Western meetings in Paris and Rambouillet on December 19–21, at which it was decided to invite Khrushchev to a summit meeting

in Paris in 1960. (See also SUMMIT CONFERENCE.)

Relations with the United States remained good throughout 1959. The overwhelmingly friendly reception accorded President Dwight D. Eisenhower on his visit to Britain from August 27 to September 2, accompanied by Secretary of State Christian A. Herter, demonstrated the solidarity of Anglo-American friendship. In addition to discussions with the British prime minister, with whom he stayed at Chequers (August 29–31), the president stayed with the royal family at Balmoral Castle (August 28–29), joined Macmillan in a nationwide radio and television discussion (August 31), and stayed on September 4–7 (after his visit to Paris) at Culzean Castle, Scotland, in the apartment presented to him after World War II by the National Trust for Scotland. Following their visit to Moscow, Prime Minister Macmillan and Foreign Secretary Lloyd arrived in Washington on March 19, spent March 20–23 in discussions with President Eisenhower at Camp David, and returned to London on March 24. The United States visit was the culmination of a series of visits to Paris (March 9–10), Bonn (March 12–13), and Ottawa (March 18–19).

An agreement between Britain and the United Arab Republic, providing for £27.5 million in compensation for British property which had been Egyptianized, was signed in Cairo on February 28, and diplomatic relations between the two countries were restored on December 1. The Cyprus question was settled by an agreement signed on February 19. After negotiations with Britain, Iraq left the sterling area on June 23. No solution to the fisheries dispute with Iceland was reached, but an agreement, signed in Copenhagen on April 27, was reached with the Danish government on a six-mile fishing limit round the Faeroe Islands. Britain's position on Laos was summarized by a Foreign Office spokesman on July 30, who said that the United Kingdom government was "deeply concerned about the maintenance of peace in Laos," and a government statement on May 4 made it clear that Britain felt that "Tibet should be autonomous, and hoped that a solution could be reached by peaceful means."

In conjunction with the governments of Denmark, Sweden, Norway, Austria, Portugal, and Switzerland, the United Kingdom government participated in meetings at Stockholm which culminated in the initialing of a treaty forming the European Free Trade Association (q.v.) on November 20. The purpose of the new organization was to facilitate negotiations between the seven governments, the European Economic Community (EEC), and other European governments looking toward freer trade in Europe and the reduction of tariffs and quotas. Steps toward this end, beginning with a 20% tariff reduction on July 1, 1960, were embodied in the treaty.

Relations with western Europe were complicated by misunderstandings with both France and Germany, which threatened to become relatively serious toward the end of the year. A visit to Paris (November 11–12) by Foreign Secretary Lloyd, and discussions with President de Gaulle, Foreign Minister Maurice Couve de Murville, and Premier Michel Debré, primarily on East-West relations and the implications of the EEC, removed the misunderstandings with France. Those with Germany were similarly removed by a visit to London (November 17–19) by Chancellor Konrad Adenauer, accompanied by Heinrich von Brentano and other ministers.

Among the many other visitors to Britain during the year were Shah Mohammed Riza Pahlavi of Iran, on a state visit (May 5–8), which was followed by discussions with Prime Minister Macmillan on May 10; Foreign Minister Subandrio of Indonesia, on an informal visit, during which discussions with the minister of state for foreign affairs, John D. Profumo, took place on June 8; Nobusuke Kishi, the Japanese prime minister, on an official visit (July 13–16); President Sékou Touré of Guinea (November 10–15); and Premier Antonio Segni and Foreign Minister Giuseppe Pella of Italy (December 1–3).

Queen Elizabeth, accompanied by the Duke of Edinburgh, made a royal tour of Canada from June 18 to August 1, during which she participated in ceremonies opening the St. Lawrence Seaway on June 26–27, in company with President Eisenhower, and visited Chicago on July 6. A projected royal tour of Ghana in November was postponed on August 7, when it was announced that the queen was expecting her third child early in 1960. The Duke of Edinburgh, however, visited Ghana on November 23–28.

On May 12, Prime Minister Macmillan announced a space research program under which Britain would design and construct instruments, ask the United States about its offer to consider flying other countries' equipment in its satellites, and study the development of British rockets for space research purposes. A further announcement, on July 29, said that, following the visit to Wash-

ington of a group of experts, British instruments would be in satellites placed in orbit by the Scout, which was being developed by the National Aeronautics and Space Administration.

GREECE. A kingdom in the Balkan Peninsula, Greece is bounded on the north by Albania, Yugoslavia, and Bulgaria; on the east by Turkey; and on the southeast, south, and west by the Aegean, Mediterranean, and Ionian seas, respectively. The area of Greece, including the islands, is 51,182 square miles.

Population.—The population of Greece is officially estimated (1959) at 8.3 million (1951 census, 7,632,801). According to the 1951 census, 47.7% of the people live in villages with less than 2,000 inhabitants and 36.8% in towns of 10,000 or more. Athens, the capital and largest city, has an estimated population of over 600,000 (1951 census, 565,084). Greater Athens, with its seaport Piraeus, Nikaia, and other suburbs, has an estimated population of 1,500,000. Other major cities, with their 1951 populations, are Salonika, 217,049; Patras, 79,014; Volos, 51,144; and Candia, 51,144. Greek is the mother tongue of 94% of the people and the official language of the kingdom. Minority groups include Turks, Bulgarians, Armenians, Macedonian Slavs, Vlachs, Albanians, and Jews.

Government.—The king, Paul I, ascended the throne on April 1, 1947. The constitution, amended in 1951, provides for a unicameral Parliament, consisting of 300 members elected by universal suffrage for 4-year terms. Women acquired full political rights in 1951. The party in power is the National Radical Union (ERE), a conservative group, headed by Constantine Karamanlis, who is premier and minister of defense. In the last elections, held on May 11, 1958, Karamanlis won 172 seats. The largest party in the opposition is the United Democratic Left (EDA), which won 78 seats.

Finance.—The budget for the fiscal year 1958–59 provides for revenues of 15.3 billion drachmas (30 drachmas = U.S.$1) from Greek sources and an expenditure of 18.1 billion. The balance is covered by United States aid, NATO expenditures, the proceeds of the Economic Development Fund, national bonds, and a loan from the West German government.

Religion.—Of the people of Greece, 98% belong to the Eastern Orthodox Church, which is the established or official church. The remainder are, in order of numerical significance, Moslems, Roman Catholics, Protestants, Jews, and Armenians. His Holiness Theoklitos, metropolitan of Patras, is archbishop of Athens and all Greece. The patriarch of Constantinople has jurisdiction over the churches of Crete and the Dodecanese and over the monasteries of Mount Athos.

Education.—In 1957–58 there were 9,026 elementary schools with 884,021 pupils (1959 est., 940,000) and 19,011 teachers, and 701 secondary schools with about 195,000 pupils and 4,775 teachers. All children between the ages of 6 and 14 must attend school. Higher education comprises the University of Athens and the University of Salonica, the polytechnic institutes located in these two cities, and half a dozen other schools of the same level. Total enrollment in higher education is about 20,000. Several thousand additional Greek students go abroad to study, especially to Italy, Austria, and the United States. Government sources estimate that 19.7% of the population between the ages of 12 and 60 is illiterate.

Transportation and Communication.—Greece has approximately 1,683 miles of railways. At the end of 1956, serviceable roads totaled 20,680 miles; a road-building program calls for the construction of 6,414 miles of new roads. As of January 1959 there were 36,363 passenger cars in Greece, 31,866 buses and trucks, and 19,500 motorcycles. Twenty-two scheduled international airlines serve the country's main airport, near Athens. In 1958 there were 151,466 telephones and 17,160 miles of telephone and telegraph lines. The Greek merchant marine numbered 1,860 vessels as of Dec. 31, 1958, with a gross tonnage of 1,040,000, but only one seventh of this is under the Greek flag. The government is making every effort to persuade shipowners to register their ships in Greece.

Economic Conditions.—Greece's gross national product—82,510 million drachma in 1957—was reported to have risen slightly in 1958. Unemployment and underemployment continued to be the main problems in the economy. Per capita income, however, stood at about $280 in 1958, as compared with $215 in 1955, and the government's five-year, 31.5 billion drachma economic development program, announced in late April 1959, is aimed at achieving further improvement. Through expansions in agriculture, industry, public utilities, education, health and welfare, and the tourist trade, it is hoped to raise the per capita income to $360 by 1963. In September 1959 the government announced its plan for an Industrial Development Corporation, to include leading banks and private businessmen, which will participate in the capital of industrial enterprises and the establishment of basic industries as part of the five-year plan.

Agriculture and Industry.—Agriculture, including forestry and fishing, is the mainstay of the Greek economy. Approximately half of the country's labor force (est. 1958, 4,175,000) is engaged in agricultural work, and nearly 85% of the country's exports consist of unprocessed and processed farm products. The net contribution of manufacturing and processing to the national income averages under 20%. Agricultural production in 1958 included the following, in thousands of metric tons (figures for 1957 in parentheses): wheat, 1,787 (1,727); barley, 267 (254); oats, 168 (186); rye, 41 (49); corn, 224 (266); milled rice, 42 (37); tobacco, 84 (102); cotton, 63 (63); currants, 83 (86); raisins, 44 (63); dried figs, 22 (22); olive oil, 99 (164); edible olives, 41 (29); citrus fruits, 263 (228); table grapes, 128 (115); deciduous fruits, 243 (266); vegetables, 1,472 (1,511); potatoes, 438 (460). Fish production, as in 1957, totaled 75,000 tons.

Construction will be begun in 1960 on a nitrogen fertilizer plant partly financed by $12 million from the U.S. Development Loan Fund. Of the government's planned investment in economic development over the next five years, 7.9 billion drachmas have been allocated to agriculture and land reclamation. Government and private investments in industry and mining are aimed at achieving an average annual increase of 9% in industrial production in that period.

Foreign Trade.—During the seven-month period from January to July 1959 the deficit in the trade balance rose to 7,272.9 million drachmas, as compared with 6,799.4 million during the same period in 1958. Exports amounted to $221.4 million from July 1, 1958, to June 30, 1959, as compared with $218.3 million during the same period of the previous year. The main exports in the 1958–59 period, in millions of dollars, were: tobacco ($79.3), cotton ($26.6), currants ($18.5), sultanas ($14.5), metals ($15.6), wines ($13), hides ($8), olives ($4.5), citrus fruits ($4.4), dried figs ($2.8), fresh grapes ($2), and olive oil ($1.1). Greece's products in 1958 went chiefly to western Europe (47%), eastern Europe (15.5%), the United States (15%), and Great Britain (8.2%). Chief suppliers were western Europe (51%), the United States (15.6%), Great Britain (13%), and eastern Europe (7.2%).

Principal Events, 1959. *Cyprus Settlement.*—The topic of general interest in Greece during the year was the solution of the Cyprus question, pending since 1950. Premier Constantine Karamanlis met his Turkish colleague, Adnan Menderes, in Zurich, Switzerland, and on February 11 concluded the agreement whereby Cyprus will be organized as an independent republic under the guarantee of Greece and Turkey. Later in the month, at a conference in London, the prime ministers and foreign ministers of Greece, Turkey, and Great Britain, and representatives of the Greek Cypriotes (Archbishop Makarios) and the Turkish Cypriotes (Dr. Fazil Kütchük) formulated the treaties and conventions regarding the future of Cyprus.

A section of the Greek press and the opposition parties criticized the agreement as unduly favor-

able to Turkey. The focal points in the criticism were the clauses that provided for the presence of Greek and Turkish troops on the island, the veto powers of the Turkish vice president, the three ministerial portfolios to the Turkish Cypriotes, and the allocation of 30% of the seats in the House of Representatives and 30% of the civil service to the local Turks, who constitute less than 20% of the total population. The Greek press followed with keen interest the negotiations that were conducted at Nicosia, Cyprus, during the remainder of the year, between the representatives of Greece and Turkey and the leaders of the Greek and Turkish Cypriotes. (See also CYPRUS; TURKEY.)

Domestic Affairs.—The various phases of the Cyprus question had direct repercussions in Athens. An important domestic affair was the emergence of Colonel (later General) George Grivas as the most popular critic of the Karamanlis cabinet. The former leader of EOKA (the Greek National Organization of Cypriote Fighters) spoke of his readiness to lead the country to reconstruction if the Greek people elected him. However, he took no steps to organize a party.

Among the political parties there was more than usual activity as the government became a target of criticism. Panayotis Kanellopoulos, joint leader of the Populist Party, joined the government as deputy prime minister on January 5. George Papandreou abandoned the Liberal Party and moved toward the organization of a party of his own, with a middle-of-the-road liberal program. Spyros Markezinis, leader of the Progressive Party, discussed possibilities of merging his organization with the Liberal Party of Sophocles Venizelos, and also of cooperating politically with General Grivas. The opposition in Parliament repeatedly asked for new elections, but the government was able to stay in power.

Foreign Affairs.—Relations with Albania and Bulgaria remained cool during the year, with tendencies to deteriorate as a result of a bloody incident along the Albanian frontier and Bulgarian intransigence regarding the payment of reparations ($45 million) from World War II. The Greek and Bulgarian governments exchanged notes in May, and on June 3 the Greek government accused Bulgaria of bad faith. The Bulgarian government, on the other hand, accused Greece of "belligerent" intentions.

Late in April the Greek government announced that the United States was going to provide Greece with tactical ballistic missiles of the Honest John and Nike types. (It was reported in October, however, that these negotiations had been abandoned.) To the protests of the USSR that such an event would be regarded as a hostile action, and to the Soviet note of May 13, the Greek Foreign Office answered, on June 4, that Greece would take all feasible measures for her legitimate self-defense, which is connected with the security of the West. In the same spirit, the Greek government answered the Bulgarian note of May 20, and complained that Greece's peaceful intentions were not reciprocated by Bulgaria. After Nikita Khrushchev's visit to Albania (q.v.) and his warnings to Greece and Italy regarding missile bases, the Greek prime minister stated on June 13 that the notes from the USSR and Bulgaria contained "threats against the Greek nation which cannot be accepted."

Relations with the Western powers became even closer as a result of the agreement on Cyprus. Greece and the United Kingdom are no longer divided on the Cyprus question, and the Greeks have consented to the maintenance of British bases on the island. The United States continued aiding Greece, though to a lesser extent than the

UPI

King Paul and Queen Frederika visit Salonika on October 27 to observe 19th anniversary of Greek defiance of Italy's ultimatum for unconditional surrender of Greek territories.

Greek government desired; and President Eisenhower was greeted by King Paul and a crowd estimated at 500,000 when he visited Athens on December 14–15 in the course of his 11-nation goodwill tour. The president addressed the Greek Parliament and conferred with Premier Karamanlis on Greece's "special situation" in the Balkans and other matters of concern to the two nations.

Vice Chancellor Ludwig Erhard of the German Federal Republic visited Athens from August 22 to August 25, and on September 19 it was announced in Bonn that the West German government had decided to lend Greece 300 million Deutsche marks ($71.3 million), a sum that will be spent on productive enterprises of an industrial and commercial nature.

GREEN, Howard Charles, Canadian public official: b. Kaslo, British Columbia, Nov. 5, 1895. A longtime political associate of Prime Minister John Diefenbaker (q.v.), Green was appointed Cana-

CAPITAL PRESS SERVICE

Howard C. Green, named Canadian minister of state for external affairs, June 4.

dian secretary of state for external affairs on June 4, 1959, following the death of Sidney Earle Smith (q.v.). His appointment capped a quarter-century of public service that began in 1935 when he was elected to Canada's House of Commons as representative of British Columbia's Vancouver South constituency.

Green received his B.A. (1915) from the University of Toronto, served as an infantry officer during World War I, took his law degree (1920) at Toronto's Osgoode Hall, and entered law prac-

tice in Vancouver. After his successful venture into politics in 1935 as a Progressive Conservative, he was re-elected in every subsequent general election (in a 1949 redistribution most of his former district was redesignated as Vaucouver-Quadra). He became Conservative floor leader following his party's victory in the June 1957 elections.

Green was appointed minister of public works in Diefenbaker's first cabinet and, until May 1958, he also served as acting minister of defense production. After his elevation to the external affairs post in June 1959, he continued to hold the public works portfolio until August, when David Walker was appointed to that ministry.

As head of his country's delegation to the Ministerial Committee on the Joint Defense of the United States and Canada, Green went in November 1959 to Washington, D.C., for two days of discussions with U.S. Secretary of State Christian A. Herter and defense officials. Green, as a spokesman for North Atlantic Treaty Organization ministers, urged more consultation among NATO Council members on negotiations with the Soviet Union.

GREENLAND. A department of Denmark in the North Atlantic. Estimated area, 840,000 square miles (143,500 ice-free); pop. (est. 1958), 28,000, mostly of Eskimo and Eskimo-Scandinavian descent. Godthaab (1,021) is the capital and chief city. Under a 1951 agreement with Denmark, the United States maintains a large military airbase at Thule, in the northwest. Greenland sends 2 representatives to the Danish Parliament, and also has its own 13-member Council elected every 4 years.

Chief occupations are fishing and the processing of fish products, sheep raising, hunting and trapping, and mining. The 1957 fish catch totaled 31,500 metric tons. Greenland is an important source of cryolite, an aluminiferous ore; other minerals include coal and lead and zinc concentrates. Greenland's exports in 1957 totaled 62.7 million kroner; imports, 91.0 million. In 1959 a law was passed by the Danish Parliament authorizing the minister of Greenland to invest a total of 57 million kroner (about $8,265,000) over the period 1959–65 for the expansion of fish-processing plants, harbors, housing, and other facilities in Greenland.

GRENADA. See WEST INDIES FEDERATION.

GROMYKO, Andrei Andreyevich, Soviet foreign minister: b. Starye Gromyki, near Minsk, Russia, July 6, 1909. Trained as an economist, Gromyko in 1939 entered the Moscow foreign affairs office as chief of its American division, and was soon sent to Washington, D.C., as a counselor to the Soviet embassy. In 1943, at the age of 34, he was made ambassador to the United States. He headed the Soviet delegation to the U.N. Conference on International Organization in San Francisco in 1945 and in 1946 moved to New York to become his government's chief delegate to the United Nations and permanent representative on the Security Council. Recalled to Moscow as deputy foreign minister in 1948, he became first deputy foreign minister in 1949, served briefly in 1952–53 as ambassador to Great Britain, and in 1953 reassumed his role at the United Nations. He was advanced to chief deputy foreign minister in 1953, and in 1957 succeeded Dimitri T. Shepilov as foreign minister.

A rigidly trained bureaucrat and adept diplomat, Gromyko reflects faithfully and unbendingly Soviet positions on international matters. At the United Nations the austere Gromyko was known as his government's "*nyet* man" in the iciest days of the cold war. It was he who delivered to the Supreme Soviet in Moscow, on Dec. 25, 1958, the fiery speech warning the Western powers that West Berlin, for which "free city" status had been demanded the previous November, might become a "second Sarajevo" and precipitate a "big war." By May 1959, however, when the Soviet line had become more conciliatory, he appeared smilingly in a debonair gray homburg at the foreign ministers' conference in Geneva, and was notably more tractable in talks with the Western representatives. He surprised the world by volunteering to attend the funeral of John Foster Dulles in Washington, D.C., on May 27. And he appeared again in a friendlier mood when he accompanied Premier Khrushchev to the United States in the fall of 1959.

GROSZ, George (65), German-American artist: b. Berlin, Germany, July 26, 1893; d. Berlin, July 6, 1959. Caricaturist of the horrors of war and of man's depravity, Grosz drew and painted a tortured image of the 20th century in styles ranging from the abstract to the representational.

Of a middle-class Lutheran family, Grosz studied art at the Royal Saxon Academy of the Fine Arts in Dresden (1909–10) and at the Berlin Royal Arts and Crafts School (1911). After serving in the German Army from 1914 to 1916, and again in 1917, he employed his skill at caricature against the Prussian militarist—whom he had admired as a boy—and against the civilian war profiteer. At first horrified by war, later disgusted by the callousness, hypocrisy, and selfishness of the bourgeoisie of the Weimar Republic, Grosz produced from 1919 to 1924 his greatest satirical drawings: in 1920 the series *Gott mit Uns* was published and in 1923, the series *Ecce Homo.* Although the Dadaists attracted him for a time, his more rational artistic approach led him to develop independently of it, moving from a semi-abstract style in the early twenties to the realism reflected in his portrait of the poet Max Hermann-Neisse (oil, 1927, Museum of Modern Art, N.Y.).

Arrested three times for "offending public sensibilities" with his mordant drawings, and fearful of the rising Nazi Party, Grosz accepted an invitation to New York's Art Students League in 1932, where he subsequently taught for more than 20 years. He became an American citizen in 1938, a year after his works had been included by the Nazis in the "Degenerate Art" exhibition in Munich. He lived near New York with his wife until shortly before his death.

From 1932 to 1936 he worked in water color and gouache, assuming a milder, more optimistic manner as he explored the country of his adoption in sketches and paintings like *Central Park at Night* (water color and gouache, 1936, Art Institute of Chicago). He then turned to oils, and to the traditional still life, the nude, and landscape. He even tried his hand at illustration in his search for the simple and peaceful. With the outbreak of war in Europe in 1939, violence began to reappear in Grosz's canvases. This time, however, the Daumier quality of his earlier satire was replaced by the nightmare worlds of Hieronymus Bosch and Matthias Grunewald and the novelist Franz Kafka. With great technical facility he built up his visions of ruin and futility with garish colors, as in *The Pit* (oil, 1946, Wichita Art Museum, Kansas) and the *Painter of the Hole* (oil, 1948, Associated American Artists Galleries, N.Y.), sometimes almost seeming to revel in the diabolic. In the last decade of his life, Grosz returned to the quieter mood of the 1930's, his need for vitriolic comment spent for the time.

In 1959 he was awarded the Gold Medal for Graphic Arts by the National Institute of Arts and Letters. His works are in permanent collections in New York, Newark, Chicago, Los Angeles, Dallas, and many other American cities.

Consult his autobiography, *A Little Yes and a Big No* (1946); Baur, John I. H., *George Grosz* (1954).

GROUP INSURANCE. See INSURANCE.

GUADELOUPE. An overseas department of France, in the Lesser Antilles islands of the Caribbean Sea. Area, 687 square miles; pop. (est. Dec. 31, 1958), 260,000. The people are predominantly colored and speak a French creole dialect. The department consists of two larger islands (Basse-Terre or Guadeloupe proper, and Grande Terre; combined area, 583 sq. mi.; pop., 219,395), and six small outlying islands and island groups (Désirade, Les Saintes, Marie Galante, Petite Terre, St. Barthélemy, and part of St. Martin). The city of Basse-Terre (12,381) is the capital; and Pointe-à-Pitre (30,078), on Grande Terre, is the chief port. The departmental prefect is aided by an elected General Council of 36 members. In 1957 there were 43,380 pupils in elementary schools, and 5,000 in secondary schools.

Agriculture is the principal occupation, and sugar and related products are of major importance. Sugar output in 1958–59 totaled 159,000 short tons (131,000 in 1957–58). Other cash crops are bananas, coffee, cocoa beans, vanilla, and pineapples. Chief industries are sugar refining, rum distilling, molasses production, and pineapple canning. Exports in 1958 totaled 14,236 million francs; imports, 20,092 million. Principal exports were: sugar, 113,661 metric tons (value, 6,829 million francs); bananas, 94,097 (5,587 million); and rum, 8,558. Trade is mostly with France. Guadeloupe has 464 miles of national and departmental roads. Four international lines provide air services.

GUAM. An organized but unincorporated territory of the United States, Guam is the largest and most populous of the western Pacific islands known as the Marianas. It lies 13° north of the equator and is situated approximately 6,000 miles southwest of San Francisco, Calif. Guam is 30 miles in length, varies from 4 to 8½ miles in width, and covers 209 square miles.

Population.—The officially estimated population of 65,000, as of June 30, 1959, is almost evenly divided between local civilians, mostly Guamanians, and transient United States civil and military personnel and their families. The present Guamanians are a mixture of native Chamorro stock with outside strains and are predominantly Roman Catholic in religion. Although English is the official tongue, the Chamorro dialect is widely used.

Populations of principal villages in 1959 were as follows: Agaña Heights, 2,557; Agat, 2,958; Barrigada, 3,708; Dededo, 2,323; Sinajana, 4,756; Tamuning, 4,192; and Yona, 2,082. Agaña (1,344) is the capital.

Government.—Guam is administered under the Organic Act of 1950, as amended. The island's relationship with the United States government comes under the general supervision of the U.S. Department of the Interior. Guamanians are citizens of the United States without the right to vote in United States elections and with no representation in the U.S. Congress.

The local government comprises executive, legislative, and judicial branches, with the executive branch of 14 departments headed by a civilian governor appointed by the president of the United States. Richard Barrett Lowe, governor since late 1956, resigned effective Nov. 14, 1959. In the absence of the governor, the presidentially appointed secretary of Guam (in 1959, Marcellus G. Boss) serves as acting governor.

A 21-member unicameral legislature, biennially elected at large, is empowered to pass laws on local matters, including taxation and appropriations measures. Enactments in 1959 of the 5th Guam Legislature, controlled by the Popular Party as the result of elections of November 1958, included a Uniform Reciprocal Enforcement of Support Act and a financial responsibility law for automobile owners. Among others were measures that authorized the Territorial Planning Commission to undertake urban planning and to accept federal grants; established daylight saving time; and provided scholarships and loans for students. A bill pertaining to the tenure of officials requiring confirmation of the legislature was vetoed by the governor.

The District Court of Guam, whose judge in 1959 was Eugene R. Gilmartin, has jurisdiction in all federal cases and in many others arising under the laws of Guam. Its decisions may be appealed to higher United States courts. The Island Court, the Police Court, and the Juvenile Court have jurisdiction in certain cases arising under the laws of Guam.

Finances.—The operating budget for Guam is derived largely from taxes on personal income, specific sales, and business gross receipts. Banking facilities are provided by a branch of the Bank of America and by the Guam Savings and Loan Association.

Education and Social Welfare.—School attendance is compulsory for all between the ages of 6 and 16, inclusive. Enrollment in the public and private elementary and secondary schools was nearly 18,000 in 1958–59, and at the Territorial College of Guam in Agaña, over 800. The government also maintains a vocational school.

Hospital facilities include a 160-bed tuberculosis hospital, a 161-bed general hospital, and 16 village health centers.

Transportation and Communications.—Guam is a port of call for two major shipping lines—the American President Lines, with an average of 18 arrivals a year, and the Pacific Far East Lines, with an average of six arrivals per month—and is the home port of the Pacific Micronesian Lines. The island is a regular stop for Pan American World Airways, with 10 flights weekly, and Transocean Airlines, with four weekly flights.

Local transportation consists mainly of taxicabs, private automobiles, and buses. There are 147.8 miles of paved and 67.1 miles of improved roads. The Radio Corporation of America provides overseas telephone and radio dispatch facilities and, at Agaña, the Guam government operates a telephone exchange serving 1,200 telephones. In 1958–59, telephone lines were extended to the last five unserved villages.

News media include the *Guam Daily News* and a local radio-television station.

Economy.—Relatively poor in natural resources, Guam is nevertheless one of the important military bases of the United States in the Pacific, thereby furnishing an important wage and service economy for local residents.

Agriculture is the other principal element in the economy, although ready employment by the armed forces and the civil government has continued to hamper agriculture with a manpower shortage. A 1957 census showed only 700 persons engaged in full-time farming. Egg production is the greatest source of farm income.

Nonfarming production activities are largely limited to fisheries (376,556 pounds for the 1957–58 fiscal year), quarrying (692,128 short tons of sand and gravel and crushed stone in the calendar year 1958, valued at $774,465), and light manufacturing (mainly food and beverage processing).

Foreign Trade.—In the fiscal year 1957–58, the commercial port of Guam handled 202,507 revenue tons of commercial imports and exports valued at $28,418,603. Principal imports, mainly from the United States, included foods, vehicles, petroleum products, construction supplies, and alcoholic beverages. The leading export is scrap metal. The commercial port, which occupies 24.5 acres, has 2,400 linear feet frontage of deep-water docking space—sufficient for the berthing of three large cargo vessels—and 110,400 square feet of warehouse space.

Principal Events, 1959.—The year's major political developments included the resignation, effective November 14, of Richard Barrett Lowe as governor of Guam; the annual session of the Guam Legislature (see above, *Legislature*); and the establishment of a District Governmental Council to promote local governmental efficiency and a closer relationship between the citizens and the executive branch.

Economic conditions were good in 1959, with retail sales, military, commercial, and private construction, bank clearances, and port receipts at expected levels. The economy expanded as a new cement-packaging plant and several construction companies began operations, and as military contracts were let for new facilities and for increased purchases from farmers.

MARCELLUS G. BOSS,
Secretary of Guam and Acting Governor.

GUATEMALA. This northernmost of the Central American republics is bounded on the west and north by Mexico, on the east by British Honduras and the Caribbean Sea, on the southeast by Honduras and El Salvador, and on the south and southwest by the Pacific Ocean. Most of the 3,546,000 people (est. mid-1958) who live in its 42,042 square miles of territory are either pure Indian (53.5%) or the sturdy Ladino descendants of Indian and Spaniard. Guatemala City, the capital, has a population (est., December 1957) of 374,000. Other towns, with their 1950 census populations, are Quezaltenango (27,696), Puerto Barrios (15,332), Mazatenango (11,032), and Antigua (10,744).

Government.—Executive power in this federal republic of 23 departments is headed by a president who appoints the governors of the departments and each March submits to Congress the list of those from whom it selects designates to take over in the event of the president's absence or death. Legislative power is vested in a unicameral Congress of 66 deputies elected for 4-year terms, with half the membership renewed at 2-year intervals. The judiciary consists of a Supreme Court of Justice, a Court of Appeals, and the usual lower courts. President Miguel Ydígoras Fuentes began his 6-year term of office on March 2, 1958; the designates elected to serve until March 1960 are Manuel Ralda Ochoa and Alberto Urrutia Vasconcelos.

Religion and Education.—Although many of the people still worship the old Indian gods, Roman Catholicism is the prevailing faith. A 1959 presidential decree recognized bishops of the Roman Catholic Church as its legal representatives, thus making it possible for the church to own property through them, for the first time since 1879.

Guatemala's exceptional educational problem is caused by the fact that so much of the work is in rural areas where so many of the people do not understand Spanish and few who know the native languages are trained to teach. On June 30, 1957, among the 644,420 children in the 7–14 age group, only 203,448 were enrolled in either public or private schools. Enrollment of all age groups in kindergartens, primary schools, and secondary schools of all types totaled 305,430 in the 1957–58 school year. The Ministry of Education, with the aid of funds provided by the U.S. International Cooperation Administration (ICA), is constructing schools in rural areas where the community furnishes labor and sometimes materials. On the secondary level each department has a prevocational institute in which the student can complete the first part of the course near his home; many who wish to continue for the final 2 years must go to Guatemala City. There a new $3 million industrial vocational training school was under construction in 1959, while a new campus for the University of San Carlos was also being built on the outskirts of the city.

Finance.—The budget for the fiscal year 1958–59 was originally set, in millions of quetzales (1 quetzal = U.S.$1), at 113.1, with 26.6 allocated for general administrative expenses; 9.2 for defense; 23.0 for social services, including education; 10.1 to service the public debt; 2.2 for government retirement pensions; and 42.0 for economic development. By the end of the fiscal year, however, the budget had been increased to 120.3 million. Budget expenditures for 1959–60 were estimated at 114.9 million.

Due to a continued rise of imports over exports and to a decline in coffee revenue, official gold and foreign exchange holdings decreased to $35.7 million by Sept. 30, 1959. In contrast, business and industrial sales in the first quarter of 1959 were $9 million higher than in the same quarter of 1958.

Transportation and Communications.—Of Guatemala's 719 miles of track, 510 miles belong to the Guatemalan section of the International Railways of Central America, controlled by the United Fruit Company, although the company is under court order to divest itself of its railway holdings by June 30, 1966.

Guatemala has approximately 5,000 miles of roads. In addition to the 73-mile Western Highway from the northern highlands to the Pacific port of Champerico, there are three trunk highways: the 239-mile Pacific Highway along the coastal plain and the 317-mile Inter-American Highway in the highlands, both extending from Mexico to El Salvador; and the 186-mile Atlantic Highway connecting the Atlantic ports with Guatemala City and with the road to the Pacific port of San José. During 1959, 115 miles of the Inter-American Highway were paved, and all bridges were completed on the Atlantic Highway. Nonofficial motor vehicles numbered 28,812 in 1957.

The government-owned national airline, AVIATECA, inaugurated new flights to New Orleans and Houston on May 22, 1959. Five foreign lines also serve Guatemala's international traffic, and La Aurora Airport at Guatemala City is being extended so that it can handle jet planes.

Plans for an $8 million telephone expansion program were approved, and part of the new system—15,000 lines in Guatemala City—was formally inaugurated on July 3, 1959.

Agriculture.—In the 1958–59 season coffee production amounted to 1,345,000 bags (132.276 pounds each), but prices were down, as were those for the 1958 cotton crop, which totaled 60,000 bales. Farm production in 1958 was generally good, especially for the corn (19 million bushels) and beans (65.9 million pounds) needed for domestic consumption. The output of sugar reached a record 120,000 short tons. Cattle herds, rebuilding since 1955, when the ban against the exportation of beef was lifted, numbered 1,333,000 head. Bananas were adversely affected by a windstorm (March 1, 1959) that caused the destruction of 700,000 stems and forced a downward revision of estimated 1959 sales to 5.3 million. United States aid to Guatemalan agriculture in 1959 included a $5 million credit for rubber production.

Industry.—The industrial production index (1953 = 100) rose from 128 in 1957 to 140 in 1958. In that year production was valued, in millions of quetzales, at 110.1, including shoes and clothing, 19.1; food products, 17.9; chemicals, 9.1; beverages, 6.2; nonmetallic minerals, 6.9; printing and publishing, 1.9; and tobacco products, 2.7. According to preliminary figures from Guatemala's first commercial census (February 1959), 23,106 small stores employed a total of 35,007 persons and did over $40 million worth of business. As the result of progress toward Central American economic integration, facilities of a Guatemalan paper plant and match factory are being expanded, while a tire plant and a paint factory are already exporting their products throughout the area. Among other industrial ventures in 1959 were a kenaf bag manufacturing plant, which received $400,000 from the U.S. Development Loan Fund, and a $1.4 million flour mill.

The 1958 electric power output was estimated at 150 million kw.-hr. On July 25, 1959, the Empresa Eléctrica de Guatemala opened the 12,650-kw. third generating unit of its Laguna thermoelectric plant at Lake Amatitlán, thereby increasing power output in the central zone of the country by 43%.

Mineral Products.—Lead, zinc concentrates, silver, antimony, and chromite are mined. The gross metal value runs to $3 million a year, and the industry gives employment to about 800 persons, not including those employed in the search for oil. That search continues with disappointing results despite the exploration concessions granted (58 as of March 1959), drilling operations underway, and the 50,000 quetzal prize offered by President Ydígoras Fuentes for distribution to the first crew to bring in a well producing in commercial quantities. As of September 1959, no such well had been discovered, although the Ohio Oil Company had found a show of oil at Chinajá, Alta Verapaz, and the Atlantic Oil Company at San Francisco, Petén.

Foreign Trade.—In 1958, Guatemala exported goods valued at $107.4 million, as compared with imports worth $134 million. Coffee sales ($77,502,000) accounted for 75% of the export value, with bananas ($8,808,000), cotton ($5,624,000), essential oils ($1,295,000), and chicle ($928,000) among other leading exports. Imports from the

United States, which totaled $78,523,000, included machinery, vehicles, metals and metal products ($33,264,000); textiles, fibers, and fiber manufactures ($10,489,000); chemical products ($9,577,000); and food products ($6,421,000). In the first 6 months of 1959, Guatemala's exports totaled $61.7 million; imports, $60.3 million.

Principal Events, 1959.—On Jan. 23, 1959, Mexico severed its diplomatic relations with Guatemala as the result of the strafing (Dec. 31, 1958) of three Mexican shrimp boats fishing in waters claimed by Guatemala, and of a charge (denied by Mexico) that a conspiracy to overthrow the Guatemalan government was based in that country. Despite new rumors in March of an invasion plot from Mexico headed by Guatemalan exiles, diplomatic relations between the two countries were resumed on September 15 after months of quiet negotiations. Other rumors of invasion, this time from Cuba, came in April, when Guatemala sent guerrillas to aid Panama in repelling invaders from its soil. On May 20 a state of alert was declared in Guatemala itself after four armed schooners from Cuba had been spotted off British Honduras. Ministers of the five Central American republics and Panama met in Guatemala City on June 4–6 to discuss regional means of checking Communist activities in the area.

July and August were marked by the election of Luis Fernando Galich as mayor of Guatemala City and by renewed leftist contention. Dr. Galich had already won the election on Dec. 7, 1958, only to have it annulled on a legal technicality. On July 5, 1959, he won again, with almost 8,000 votes more than those of his only real rival, the right-wing candidate, Carlos Enrique Guillén Rodas, and was sworn in to office on August 5. On July 21, came the first of a series of bombings when home-made bombs were exploded at the archbishop's palace and the United States embassy. Government investigations led to arrests of left-wing individuals.

On October 9, the government announced the resumption of diplomatic relations with West Germany, ending the state of war that had existed since World War II.

On December 5, in a formal notification presented at a special meeting of the Council of the Organization of American States, the government of Guatemala warned of Cuban support of "Communist and pro-Communist" groups preparing an armed invasion of Guatemala from a Cuban base. Similar uneasiness over mounting leftist influence in Guatemala was evidenced in the December 6 congressional elections. Of the 9 political parties which nominated a total of 185 candidates for the 33 seats at stake, 5 were rightist; the others ranged from moderate leftist to Communist infiltrated. The ruling National Democratic Reconciliation Party won 17 seats; right-wing parties, 9; the leftist Revolutionary Party, 5; and others, 2.

MADALINE W. NICHOLS,
Specialist in Latin American Affairs.

GUEST, Edgar Albert (77), American journalist and writer of verse: b. Birmingham, England, Aug. 20, 1881; d. Detroit, Mich., Aug. 5, 1959. Edgar A. Guest, known in his later years as the "poet of the plain people," was taken from England to the United States in 1891 by his parents, who settled in Detroit. In 1895, after attending public schools in that city, young Edgar was employed by the Detroit *Free Press* as an office boy and, subsequently, as a member of its editorial staff.

Guest's homey verse, published in the *Free Press*, gained wide popularity, and he was soon given a column of his own, first entitled "Chaff,"

WORLD BANK

Straddling the Las Vacas River canyon at Guatemala City, this bridge is part of Guatemala's new Atlantic Highway system, connecting the capital with the Caribbean coast.

then "Blue Monday," and finally "Edgar A. Guest's Breakfast Table Chat." Through these columns, which at the height of their popularity were syndicated in hundreds of newspapers, Guest circulated his homespun philosophy and sentimental rhymes, extolling favorite commonplace verities—the virtues of motherhood, friendship, humility, honest labor, and the like. Few readers doubted his sincerity, but critics were for the most part scornful of the literary merit of his work.

Adding to Guest's income, which at its peak was estimated to be as high as $130,000 a year, were radio and television programs and royalties from numerous collections of his cheerful verses, under such titles as *When Day Is Done* (1921), *Harbor Lights of Home* (1928), and *Life's Highway* (1933).

GUIANA. See BRITISH GUIANA; FRENCH GUIANA; SURINAM.

GUIDED MISSILES. See MISSILES and the Index entry, *Missiles.*

GUINEA. An independent republic on the west coast of Africa. Estimated area, 94,925 square miles; pop. (est. Dec. 31, 1957), 2,504,000, consisting chiefly of the Fullah, Malinké, and Soussou ethnic groups. French is the official language. Chief cities are Conakry (49,200), the capital and main port; and Kankan (24,600) in the eastern interior.

Visiting the United States, Guinea's President Sékou Touré (right) is greeted on Nov. 5, 1959, at U.N. Headquarters in New York City by U.N. Secretary General Hammarskjöld.

WIDE WORLD

Government.—Formerly French Guinea, a territory of French West Africa (q.v.), Guinea was the only French territory to reject the new French Constitution in the referendum of Sept. 28, 1958. By this action, Guinea dissociated herself from the newly emerging French Community (q.v.). The Territorial Assembly (elected in 1957) proclaimed Guinea an independent republic on Oct. 2, 1958, constituted itself a Constituent Assembly, and chose Sékou Touré (leader of the dominant Democratic Party) as head of the first government. The assembly adopted a draft constitution on November 12, terming the government a republic of the presidential type. The president, who is invested with considerable power as head of the state and the armed forces, is elected for a seven-year term by universal suffrage. On November 23, Guinea and Ghana signed an agreement for confederation.

Education and Religion.—In 1958 there were 315 schools with a total of 45,389 pupils (11.5% of the school-age population). Expenditure on education totaled 1,082 million francs CFA, or about 15.6% of the territorial budget. The majority of the population are Moslems.

Finance.—The ordinary budget for the territory totaled 6,328 million francs CFA; the extraordinary budget, 635 million (the franc CFA equals 2 metropolitan French francs). In the period 1947–57, French aid granted under the Economic and Social Investment Development Fund (FIDES) was equivalent to $78.7 million. Following Guinea's withdrawal from the French Community, France announced the cessation of aid. In November 1958, Ghana extended to Guinea a low-interest loan of £10 million.

Transportation.—Guinea's railway extends 414 miles from the port of Conakry to Kankan. The road network totals 4,745 miles (1956), including 1,842 miles of highways and 1,341 of other surfaced roads. The principal airports are at Conakry (of international class) and Kankan.

Production.—Guinea's economy is mainly agricultural and pastoral. Rice, millet, peanuts, bananas, and tropical fruits and vegetables are the principal subsistence crops. Cash crops, which provide a large share of exports, include coffee, bananas, palm kernels and palm oil, pineapples, copal gum, kola nuts, sesame, and tobacco. Cattle raising is important in the elevated Fouta Djallon region. Guinea is Africa's largest producer of bauxite (1957 output: 366,000 metric tons). Rich deposits were recently discovered at Boké and in the Fouta Djallon region, and an international consortium, known as FRIA, has been formed to develop a $133 million project for the mining of bauxite and the production of alumina. Output of iron ore (1,089,000 metric tons in 1957) is as yet relatively small, in comparison with Guinea's vast reserves. Diamonds are also mined.

Foreign Trade.—Guinea's exports totaled 4,875 million francs CFA in 1958; imports, 12,999 million. Chief exports were: green coffee, 10,264 metric tons (1,748 million francs CFA); bananas, 64,908 (1,067 million); palm kernels, 19,371 (502 million); bauxite, 263,667 (337 million); and iron ore, 333,821 (244 million). France purchased 69% of exports and provided 72% of imports.

Principal Events, 1959.—The abrupt cessation of French aid following Guinea's opting for independence, and the unwillingness of other Western powers to vex France by rushing in to fill the gap, gave the Soviet bloc a chance to enhance its prestige in Guinea. As early as late 1958, Communist-bloc technicians and advisers were reported in Guinea, and in March and April 1959 three Communist-bloc ships unloaded cargoes of light arms and agricultural equipment at Conakry. Following a visit to the Soviet Union by a Guinea delegation, an agreement was concluded in Moscow on August 24 for a low-interest Soviet loan of 140 million rubles for technical assistance and economic development.

Guinea's leaders, however, denied that these developments meant Guinea's gravitation toward the Soviet bloc. President Sékou Touré declared that Communist arms aid had been accepted only after a request for aid from the United States had remained unanswered. Touré defined Guinea's attitude as one of "positive neutralism," meaning that Guinea would welcome the friendship of all nations, but would be guided specifically by the principle of emancipation of the peoples of Africa. On January 7, technical and cultural accords were signed in Paris, whereby Guinea continued in the franc zone and retained French as the official language. France granted formal recognition to Guinea on January 15. Later in the year, Guinea accepted gift shipments of rice and wheat from the United States, and on October 26, President Touré arrived in the United States on a two-week official visit. Touré followed his visit to the United States with a tour in November of several European countries, including the USSR, which he visited from November 19 to 27.

In the course of a visit to Guinea by Prime Minister Kwame Nkrumah of Ghana, April 23–May 12, Nkrumah and Touré concluded an agreement on May 1, in Conakry, designed to lay the foundation of a Union of Independent African States. The two leaders envisioned a union whose members would have a common defense policy and a common aim of promoting African self-determination, although each member would retain its own army and conduct its own foreign relations. The agreement also provided for the establishment of a Union Economic Council and a Union Bank.

HAITI. A republic comprising the western third of the Caribbean island of Hispaniola. Area, 10,714 square miles; pop. (est. July 1, 1958), 3,424,000. Chief cities and populations (1950 census): Port-au-Prince, the capital, 134,117; Cap Haïtien, 24,423; and Gonaïves, 13,634. The population is Negro, with a mulatto minority forming a social elite. Over four fifths of the population is rural. French, the official language, is spoken by a minority, chiefly in the capital. A Creole French is the popular tongue.

Government.—Following the ouster of President Paul Magloire on Dec. 12, 1956, several provisional governments succeeded one another under conditions verging on civil war. On June 14, 1957, a 3-man military junta seized power. Elections held under the junta on Sept. 22, 1957, resulted in the victory of Dr. François Duvalier, the junta-sponsored candidate. A 21-member Senate was elected for a 6-year term, and a 37-member Chamber of Deputies for a 4-year term. Duvalier took office as president on Oct. 22, 1957, the junta relinquishing its power. Leaders of opposi-

tion parties, charging Duvalier's victory was rigged by the army, have gone into hiding or exile. The Duvalier administration dominates the legislature and permits no criticism. Plots against the regime, government counterterrorism, and rule by decree and under states of siege have been the principal features of Haitian political life since 1957.

Education and Religion.—About 89% of the population over 15 years of age was illiterate in 1950. In 1957, urban primary schools had 96,619 pupils; rural schools, 99,639. On the secondary level there were 15 national *lycées*, 20 private schools, and several professional, technical, and vocational schools. The University of Haiti had 982 students in 1957. Many schools are conducted by Roman Catholic teaching orders and Catholicism is the chief religion. Voodoo is widely practiced in rural areas.

Finance.—The 1958–59 budget passed by the legislature in 1958 called for expenditures of about 192 million gourdes (the Haitian gourde equals U.S.$0.20). The economic depression resulting from the poor 1958–59 coffee crop and the fall in world coffee prices made it clear by January 1959 that revenue would be far below even the 1957–58 total of 140.5 million gourdes. The Duvalier government cut government salaries, reduced public works outlays, and undertook other economy measures, but it was largely United States aid which staved off complete bankruptcy in 1959. (See below, *Principal Events.*)

Transportation and Communications.—The National Railroad Company of Haiti operates a 112-mile line from Port-au-Prince to Verrettes; there is also a narrow-gauge line of 75 miles. Roads suitable for motor traffic totaled 1,862 miles (including 225 miles asphalted) in 1954. The Haitian Aviation Corps provides internal air services; foreign lines operate out of Bowen Field, at Port-au-Prince. Telephones number 4,200 (1958); passenger cars, 5,642 (1958); radios, 19,000 (1956); and daily newspapers, 7 (1958; total circulation: 12,000).

Production.—The great majority of the population are impoverished peasants, subsisting on small, primitively tilled farms. Maize (corn), rice, peas and beans, manioc, yams, mangoes, and avocados are the main food crops. Coffee is the chief cash crop, and yearly variations in yield and price levels exert a decisive effect on the economy as a whole. Exportable coffee output in 1958–59 totaled 300,000 bags (132.3 pounds each), far below the 550,000 of 1957–58. Sugar production in 1958–59 was estimated at 60,000 short tons (prelim.), about half of which was for export; cocoa beans, 4 million pounds (1958–59); sisal, 60 million pounds (est. 1958). Minor cash crops include castor beans, essential oils, bananas, and cotton.

Manufactures are on a small scale and include cement, cotton goods, edible oils, lard, soap, flour, kitchenware, pharmaceuticals, and sisal and straw products. Bauxite is mined by an American firm, and copper ore by a Canadian company. American tourist spending, an important source of income, approximated $7,114,000 in the year ending Sept. 30, 1958, down about 8% from the preceding year.

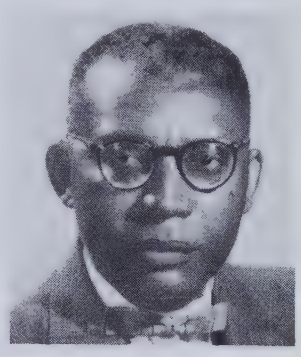
Foreign Trade.—Exports in 1958 totaled 197.1 million gourdes; imports, 202.5 million. Chief exports and values were: coffee, 145.5 million gourdes; sisal, 26.6 million; and sugar, 4.0 million. Over 60% of Haiti's imports come from the United States. Haiti's principal customers are the United States, Belgium, France, and Italy.

Principal Events, 1959.—The extremely poor 1958–59 coffee crop, the fall in world prices of coffee and sisal, and the decline in income from tourism resulted in a severe economic depression beginning in late 1958. Drought cut sugar and sisal output in 1959, and in some areas—as at Jean-Rabel, on the northwest coast—meant famine and death for hundreds of persons. Special food shipments were sent to distressed areas by the Catholic Welfare Service and the Church World Service. To help meet Haiti's budget and balance-of-payments deficits for the period February–September, the United States made available up to $6 million in Mutual Security funds. On May 28, Haiti signed an agreement to receive $4.3 million from the U.S. Development Loan Fund for the completion of the Artibonite Valley project, and on September 23 a $3 million loan was approved by the fund for the completion of a sugar mill project near Cap Haïtien.

Conditions of political insecurity were aggravated by the economic crisis and the general Caribbean unrest. Following the success of the Cuban revolution under Fidel Castro, Haitian leaders in exile, particularly former Senator Louis Dejoie, began broadcasts from Cuba against the Duvalier regime. On April 11, Clément Jumelle, an opposition leader in hiding from Duvalier, died in asylum at the Cuban embassy in Port-au-Prince, and Haitian police seized the body to prevent an antigovernment demonstration at the funeral. Duvalier suffered a near-fatal coronary occlusion on May 25 and was unable to resume his duties until July 6. During this time, rumors were rife of an impending uprising or invasion. The bombing of a government-run gambling casino on June 14 was followed by widespread arrests and the redoubling of the administration's watchdog efforts.

The anticipated invasion came on August 13, when a group of 31 armed men landed at Les Irois, on the southwest peninsula. The rallying of the population against Duvalier, which the sponsors of the invasion apparently counted on, failed to materialize, and the small band was wiped out by Haitian Army forces within a few days. The Haitian government, charging that the invaders had come from Cuba and were mostly members of the Cuban revolutionary army, called for an investigation by the Organization of American States (q.v.).

One of the results of the government's repressive policy was a rift with the church. On August 18 the government ordered the deportation of two French Roman Catholic priests for alleged antigovernment activities. A mass prayer on behalf of the priests in Notre Dame Cathedral was dispersed with considerable brutality by the police. On August 20, Msgr. François Poirier, archbishop of Port-au-Prince, was ordered arrested for having criticized the government in the matter of the priests' expulsion. The arrest order was suspended, however, on August 21.



François Duvalier, president of Haiti, whose regime was subjected to new pressures in 1959.

WIDE WORLD

President Duvalier on October 9 ousted six senators critical of his regime on charges of plotting to overthrow the government. Elections to fill the vacant seats were held on November 15.

M. J. G.

HALIFAX, Earl of (Edward Frederick Lindley Wood) (78), British statesman: b. Powderham Castle, near Exeter, England, April 16, 1881; d. Garrowby Hall, near York, England, Dec. 23, 1959. The first Earl of Halifax served his country for 36 years under seven prime ministers. He was Britain's foreign secretary in the explosive years 1938–40 and ambassador to the United States from January 1941 through World War II until May 1946.

A graduate of Eton and of Oxford University's Christ Church College (B.A. 1903) and All Souls College (M.A. 1906), he was elected in 1910 to the House of Commons, where he served until 1925. During these years he also held posts in the ministry of national service and the colonial service and was president of the Board of Education (1922–24) and minister of agriculture (1924–25). From 1926 to 1931, as the first Baron Irwin of Kirby Underdale, he was viceroy and governor general of India. Thereafter he was again president of the Board of Education (1932–35), secre-

tary of state for war (1935), and lord privy seal (1935–37). He became the third Viscount Halifax in 1934, on his father's death.

In February 1938, on the resignation of Anthony Eden as foreign secretary, Halifax was named to that post by Prime Minister Neville Chamberlain. He worked with Chamberlain in the vain attempt to prevent war, then became an equally ardent supporter of Britain's war effort. Winston Churchill, who succeeded Chamberlain as prime minister, named Halifax ambassador to the United States in January 1941. In the months before Pearl Harbor, he had to conduct delicate negotiations for United States aid to the British war effort in an atmosphere of uncertainty and occasional hostility. By the end of his ambassadorial service, during which he visited every state in the Union, he was a widely respected friend. His services were recognized by King George VI with the earldom of Halifax in 1944 and the Order of Merit in 1946.

Lord Halifax stepped out of public life in 1946. He toured the United States once more in 1951, in behalf of the Commonwealth Fund. His memoirs, *The Fullness of Days,* appeared in 1957.

HALLECK, Charles Abraham, U.S. congressman: b. Demotte, Ind., Aug. 22, 1900. On Jan. 6, 1959, Indiana's Republican representative was elected minority leader of the House of Representatives in the 86th Congress. Taking over leadership of a Republican contingent badly outnumbered (283–152) by the largest Democratic majority in 20 years, Halleck led House Republicans in a strong minority performance. Summing up the first session as it closed, on Sept. 13, 1959, New York *Times* correspondent John Morris wrote: "Particularly in the House of Representatives, the depleted Republican minorities fought [Eisenhower's] causes with an effectiveness far beyond their numerical potential." He attributed their success largely to Halleck's "rise . . . as Republican leader of the House and as a powerful voice in White House councils."

There was a solid background for this successful performance. Both of Halleck's parents were lawyers, and his father served two terms in the Indiana Senate. A Phi Beta Kappa graduate of the University of Indiana (B.A. 1922) and top man in his law school class there (LL.B. 1924), Halleck served 10 years as a state prosecuting attorney before being elected, in 1935, to the House of Representatives. In his 24-year career in the House, he was twice floor leader under Speaker Joseph W. Martin, Jr., of Massachusetts, whom he succeeded as Republican House leader. He developed a single-minded devotion to the Republican Party that enabled him to move without losing stride from a pre-World War II isolationism to his subsequent position as a stanch supporter of the "liberal Republican" policies of President Eisenhower.

HALSEY, William Frederick, Jr. (76), American naval officer: b. Elizabeth, N.J., Oct. 30, 1882; d. Fishers Island, N.Y., Aug. 16, 1959. As commander of powerful naval forces in the Pacific during World War II, he unleashed a series of far-ranging strikes against the Japanese which exacted an enormous toll in enemy personnel, ships, and planes. His great contribution to the science of naval warfare was in the development of the carrier task force, a weapon he used with imagination and daring.

The son of a naval officer, Halsey attended the University of Virginia before entering the Naval Academy in 1900. While at Annapolis he distinguished himself primarily as a football player. (Some say the nickname "Bull" originated here; at any rate, it was an epithet which Halsey disliked.) After graduation in 1904, he rose steadily through the ranks. In World War I he commanded a destroyer force based in Ireland, and he later served in the Pacific, in the Office of Naval Intelligence, and as naval attaché in European posts. In 1926 he became executive officer of the battleship *Wyoming,* and from 1932 to 1934 studied at the Naval War College and the Army War College. A firm believer in naval airpower, he qualified as a naval aviator at the age of 52 and subsequently was given commands of the carrier *Saratoga* and the Pensacola (Fla.) Naval Air Station. Becoming a rear admiral in 1938, he was appointed vice admiral two years later and placed in command of a carrier division.

When the Japanese struck Pearl Harbor on Dec. 7, 1941, Halsey was returning from Wake Island at the head of a carrier task force, the only naval unit operating under battle conditions at that time. Two months later Halsey, in his beloved flagship, the carrier *Enterprise,* launched the first

UPI

William F. Halsey (1882–1959)

counterattack against the Japanese when he led a task force against enemy-held islands in the Marshalls and the Gilberts. In October 1942 he became tactical commander of the South Pacific theater, and in the following month he engaged a Japanese fleet in a major sea battle off Guadalcanal, sinking at least 23 ships and breaking the enemy's momentum in the Solomons. He was promoted to full admiral on Nov. 18, 1942.

For the next two years Halsey mounted a bold and aggressive campaign against the Japanese Navy. His plan of battle was direct and characteristic: "Hit hard, hit fast, and hit often." By the time of his appointment as head of the powerful Third Fleet on June 17, 1944, the tide of battle in the Pacific had turned, due in large measure to the staggering losses his daring forays had inflicted upon the adversary. (In the last five months of 1944 alone, the Third Fleet destroyed 7,315 planes, 90 warships, and 2 million tons of merchant and transport vessels.) The most notable of the late-1944 exploits were the admiral's decimating attacks on the Japanese in the Battle for Leyte Gulf (October 22–27) and an engagement off Cape Engaño (October 25), both in support of the recapture of the Philippines. As the enemy weakened, Halsey pressed the offensive relentlessly, delivering powerful blows in the Ryukyus, Taiwan (Formosa), South China, and other areas leading to and finally including the enemy homeland. On Sept. 2, 1945, the World War II hero witnessed the formal surrender of Japan aboard his flagship, the battleship *Missouri.*

Raised to the five-star rank of fleet admiral on Dec. 11, 1945, Halsey retired from the Navy on April 1, 1947, and the following year entered a

business career. He served as an officer in a number of firms, including subsidiaries of the International Telephone & Telegraph Corporation.

HAMMARSKJÖLD, Dag Hjalmar Agne Carl, secretary general of the United Nations: b. Jönköping, Sweden, July 29, 1905. Although the international scene in 1959 proved to be relatively free of explosive incidents, such as the Lebanon and Quemoy crises of the previous year, Hammarskjöld traveled widely for discussions with world leaders on a number of serious problems, including Germany, the Middle East, and Laos (qq.v.).

The son of Sweden's World War I premier, Knut Hjalmar Hammarskjöld, he was educated at the universities of Uppsala and Stockholm and subsequently held financial posts in the Swedish government. He took part in various post-World War II international conferences, and in 1949 became undersecretary of state in Sweden's Ministry of Foreign Affairs. While serving as deputy foreign minister and as head of the Swedish delegation to the United Nations, he was appointed in 1953 as secretary general of the United Nations. He began his second five-year term in that post on April 10, 1958.

Hammarskjöld started the year 1959 on a January tour of the Middle East, aimed at reducing tensions between Israel and her Arab neighbors. The continued refusal of the UAR to permit Israeli ships or cargoes through the Suez Canal, and Jerusalem's vehement protests, prompted Hammarskjöld to return to the area for a conference in Cairo with President Nasser on July 1. The secretary general failed to persuade Nasser to relax the ban against Israeli shipping, and his later compromise plan, which would have opened Suez to Israeli cargoes carried in foreign-owned vessels, was summarily rejected by the Ben-Gurion government on August 13.

Returning from a four-week tour of nine Asian capitals (in Burma, Thailand, Laos, Cambodia, Malaya, India, Pakistan, Nepal, and Afghanistan), the secretary general stopped off in the Soviet Union to meet with Premier Khrushchev on March 27 at the Black Sea resort of Sochi. It was assumed that their discussions included the Berlin dispute which then held the center of world attention. Before convening the meeting of the Big Four foreign ministers in Geneva on May 11, he offered the U.N. Security Council as a forum for the negotiators, should the conference fail to reach accord on the Berlin issue and on the larger question of German reunification. Hammarskjöld announced (May 21) his opposition to the stationing of a United Nations military garrison in the divided city, but said (July 23) that he was prepared to dispatch an observer group there if so requested by the occupying powers.

Despite Soviet objections, Hammarskjöld visited Laos on November 12–19, where a United Nations subcommittee earlier had investigated Laotian charges that Communist rebels from North Vietnam had invaded her territory. He named a personal representative to survey the situation and to advise him on what assistance the United Nations might extend to that country.

In the introduction to his annual report to the General Assembly, made public on September 2, Hammarskjöld presented his views on the growing tendency of nations to conduct negotiations outside United Nations auspices. Although he approved the principle of private diplomacy without the fanfare of public debate, he advised the major powers against reaching bilateral agreements which might be prejudicial to the smaller nations. The United Nations, he asserted, must continue to hold "primary responsibility" for dealing with situations which threaten world peace. (See also UNITED NATIONS.)

HANDBALL. See SPORTS, GAMES, AND SHOWS.

HARNESS RACING. See SPORTS, GAMES, AND SHOWS.

HAWAII. Admitted to the Union on Aug. 21, 1959, Hawaii is a large archipelago of volcanic origin lying in the Pacific Ocean 2,090 nautical miles southwest of San Francisco. The "Aloha State" constitutes the newest and southernmost of the United States and ranks 44th in population (597,910 civilians as of July 1, 1959, and approximately 43,000 military personnel) and 47th in area (6,406 square miles of land and 16 of inland water). Honolulu (pop., 321,583), on Oahu, is the capital, largest city, and principal port.

Area and Population.—The eight major islands of the state and their areas and populations are as follows:

Island	Land area (sq. mi.)	Population (July 1, 1959)
Hawaii	4,021	59,996
Maui	728	35,364
Oahu	589	466,402
Kauai	551	27,725
Molokai	259	5,909
Lanai	141	2,267
Niihau	72	247
Kahoolawe	45	0

The population is of diverse racial extraction and is characterized by a high ratio (about one third) of intermarriages between the various ethnic stocks. Persons of Japanese and Caucasian origin constitute the two largest groups; others include full-blooded Hawaiians, Chinese, Filipinos, Koreans, Puerto Ricans, and Samoans. Approximately 97% of the entire population are United States citizens.

In addition to the 8 major islands listed above, the state includes the Leeward Islands (except Midway), a chain of small islands, shoals, and reefs extending some 1,250 miles northwestward from Niihau and forming the Hawaiian Islands Bird Reservation, almost uninhabited (except for a few Coast Guard and other official personnel). The Leeward group includes the following: Nihoa, Necker, French Frigate Shoal, Gardner Pinnacles, Maro Reef, Laysan, Lisianski, Pearl and Hermes Reef, and Kure (or Ocean) Island. Other small bodies of land within the archipelago which may be exposed at low tide are deemed part of the state.

Palmyra Island (area about 1 square mile), formerly part of the Territory of Hawaii, was excluded from the jurisdiction of the state under the statehood act.

Government Structure.—The governor and lieutenant governor (not necessarily of the same political party) are elected for four-year terms. The only major units of local government are the three counties of Maui, Kauai, and Hawaii, and the city-county of Honolulu, each governed by an elected board (and, in Honolulu, by a mayor). Most major functions of government, including education, are exercised by the state.

Chief state officers in 1959 were:
Governor: William F. Quinn (Republican)
Lieutenant Governor: James K. Kealoha
Attorney General: Shiro Kashiwa
Superintendent of Public Instruction: Walton M. Gordon
Budget Director: Paul J. Thurston
Chief Justice, Supreme Court: Wilfred Tsukiyama

Constitution and Judiciary.—Hawaii's constitution was drafted in 1950 and ratified by the people twice—on Nov. 7, 1950, by a ratio of 3 to 1 and on June 27, 1959, by 17 to 1. It is relatively brief (11,400 words) and, within an overall spirit of conservatism, incorporates the better provisions of recent constitutional formulations. For example, it is a "short ballot" constitution, limiting elective offices to the governor, lieutenant governor, and legislators; all other officials are appointed either by the governor or, as in the case of the University of Hawaii president, by a governing board appointed by the governor. Decennial reapportionment of the legislature is required, and any citizen may seek a court injunction to compel the governor to fulfill this constitutional duty. Revision of the constitution must also be considered every 10 years. The right to organize is guaranteed to persons in public and private employment.

An anomaly of the constitution, expanded upon in the statehood act, denies the state power to make basic changes in the Hawaiian Homes Commission Act without approval by the U.S. Congress. This measure, enacted by Congress in 1920, makes homesteads available to Hawaiians (50% or more Polynesian blood) at $1 annual

rentals under 99-year leases, and provides for low-cost loans.

The state's judiciary is headed by a 5-member Supreme Court and also includes 11 Circuit Court judges and a tax appeal court, all appointed by the governor, and district court magistrates, appointed by the chief justice of the Supreme Court. As a state, Hawaii continues in the ninth district of the federal court system, but with the jurisdiction of its own Supreme Court considerably enlarged by virtue of statehood.

Legislature.—The first state legislature was elected on July 28, 1959, according to the schedule set by the congressional act admitting Hawaii to statehood. To the state House of Representatives were elected 33 Democrats and 18 Republicans (identical to the division of the last territorial legislature), but the Republicans gained control of the Senate, 14 to 11. At the same time, Hawaii elected Oren E. Long (Democrat) and Hiram L. Fong (Republican) to the U.S. Senate and Daniel K. Inouye (Democrat) to the U.S. House of Representatives. After the 1960 apportionment of Congress, Hawaii is expected to receive a second seat.

The last territorial legislature, which met in February through May 1959, prepared for statehood by making necessary changes in the election laws, setting the salaries of the governor, judges, and other state officers, adopting a state seal, and taking other actions. It also created an interim committee to recommend an administrative structure whereby more than 80 territorial agencies would be reorganized under no more than 20 principal departments, as required by the state constitution.

A reorganization plan was submitted to the state legislature, which met in special session on Aug. 31, 1959. After amendment, it was unanimously approved by the lower house, but rejected by the Senate, and the legislature adjourned on October 31 without having effected reorganization. The governor thereupon called the legislature back into a second special session, beginning November 9, again to attempt reorganization. On November 14 the legislature successfully completed action on the reorganization bill, which creates 18 departments instead of the former 80.

Finance.—Hawaii has a centralized system, wider in scope than most mainland states. Chief revenue sources are the general excise (a comprehensive turnover) tax; personal and corporate income taxes; gasoline, liquor, and tobacco taxes; and a real property tax collected by the state for the counties. The net assessed valuation of real property for the calendar year 1959 was $1,152 million. The average property tax was $15.45 per $1,000 of assessed value.

During the fiscal year ended June 30, 1959, state receipts (general and special funds) totaled $199,468,000; payments totaled $164,046,000. State bonded indebtedness was $97,595,000 on June 30, 1959; the General Fund then had a balance of $18,630,000.

Banking.—Six banks, operating 70 branches, had total deposits of $616,510,000 and total assets of $666,138,000 on June 30, 1959.

Education.—Compulsory education for children between 6 and 16 years of age, inclusive, is centrally administered by the state Department of Public Instruction. Expenditures for public instruction during the fiscal year 1958–59 approximated $40 million for a program administering to 208 public schools with an enrollment of 135,088 and a teaching staff of 5,900. Ninety-five private schools, with classes ranging from kindergarten to 12th grade, enrolled 28,699 pupils.

Five colleges were in operation in 1959, four on Oahu and one on the island of Maui. The University of Hawaii, a land-grant college (founded 1907), with campuses at Honolulu and Hilo, had a student enrollment of 7,505 and a professional staff of 663 during the academic year 1958–59.

Social Welfare.—During the fiscal year 1958–59 the state Department of Public Welfare expended $6,500,000, exclusive of administrative costs, for public assistance programs. Slightly less than half of these costs were borne by the federal government under national social welfare laws.

Transportation and Communications.—Honolulu is a regular port of call for several steamship lines, connecting the islands with the United States mainland and with Canada, Australia, the Philippines, China, and Japan. During the year ended June 30, 1959, 1,243 overseas vessels entered the port of Honolulu with 3,677,000 tons of cargo and cleared with 2,422,000 tons. Freighters, barges, and a limited ferry service provide transportation between the islands, but almost all passenger travel (696,000 interisland trips in 1958) is by air, with 4 airlines and 13 airports serving the state. Seven major and 4 supplemental airlines connect Hawaii with the United States west coast, Canada, Australia, and the Far East, carrying 456,000 overseas passengers in 1958. Late in 1959, jet air travel was begun, which reduced flying time between Hawaii and California to 4½ hours. Earlier in the year, ground was broken at Honolulu International Airport for a $23 million jet airfield.

In 1959 approximately 180,000 passenger motor cars were locally registered. Interisland communications, as well as communications with the continental United States, are facilitated by radiotelephone service. Wireless telegraph service is maintained between the 6 largest Hawaiian is-

(*Left*) President Eisenhower, flanked by Vice President Nixon (left) and House Speaker Sam Rayburn, reaches for one of 12 pens which he used to sign proclamation admitting Hawaii to the Union as the 50th state, August 21. Other witnesses are (from left) Lorrin P. Thurston, Hawaii Statehood Commission chairman; Edward E. Johnston, former secretary of the territory; Interior Secretary Fred A. Seaton; David W. Kendall, special counsel to the president; Senator-elect Oren E. Long and Representative-elect Daniel K. Inouye, both of the new state. (*Right*) Gov. William F. Quinn, who was sworn in the same day, signs Hawaiian statehood documents in Honolulu. Observing the ceremony are Senator-elect Hiram L. Fong (left) and Lt. Gov. James K. Kealoha. Hawaii and Alaska are the first new states since New Mexico and Arizona entered the Union in 1912.

lands, and underseas cables connecting Point Reyes, Calif., and Oahu provide telephone connections to the mainland of North America.

Other communications facilities in 1959 included 185,000 telephones; 15 commercial and 1 noncommercial radio stations; and 3 television stations in Honolulu, with 4 satellite stations on other islands. Six daily newspapers are published in Honolulu (2 in English, 2 in Chinese, 2 in Japanese and English); the other three counties are each served by one English newspaper. Twelve other newspapers and 10 magazines were published in the state in 1959.

Industry.—The production of cane sugar and the production and processing of pineapple, both highly mechanized, are the two most important industries in Hawaii. The combined value of these two crops for 1958 ($106 million for sugar, $124 million for pineapple) constituted about 83% of total agricultural income. In 1958 (all sugar plantations were on strike for 4 months during that year), 221,683 acres of sugarcane were cultivated, producing 765,000 short tons. During 1959, 27 plantations and about 2,000 independent planters employed 15,200 workers (September). For the crop year ending May 1958, pineapple products totaled 27,270,000 cases of canned fruit and juices. The industry employed 12,620 persons (September 1959). Coffee production for 1958 was estimated at 7,248 tons, valued at $7.2 million. Animal products for 1958 had a value of approximately $31 million, and the fish catch for the year was estimated at almost $3 million.

An expanding tourist industry in 1958 brought to Hawaii 171,588 visitors who spent about $82 million in the state.

Construction in 1958 continued at a peacetime high, the value of completed buildings and other improvements aggregating $175 million.

Labor.—The labor force for all industries in September 1959 was estimated to be 224,000. Aside from workers on sugar and pineapple plantations, agriculture employed 12,990 persons. Manufacturing of food, textiles, chemicals, and miscellaneous commodities gave employment to 25,310. Wholesale and retail trade employed 38,960. The largest union is the International Longshoremen's and Warehousemen's Union, which has organized the sugar and pineapple industries, as well as longshore operations. There are also locals of the AFL-CIO and of independent unions in the state.

The largest single employer in the state, the federal government, employed 26,050 civilians plus approximately 43,000 military personnel as of September 1959. In the same month 19,930 persons were employed by state and county governments. In all, government jobs comprised about one fourth of total employment.

Unemployment in 1959 averaged about 3.2% of the labor force. Unemployment benefit payments in the fiscal year 1959 aggregated $3,800,000. Since 1957, and uniquely among the states, Hawaii's employment security program has included agricultural workers.

Economic Level and Balance of Payments.—Hawaii's gross product (aggregate value of all goods produced and services rendered) in 1958 was estimated at $1,400 million. Personal income totaled $1,154 million, with per capita income during 1958 amounting to $1,852—an average which ranked Hawaii 29th among the states, excluding Alaska.

The state's balance of payments for 1958 showed, for the seventh consecutive year, an excess of income from the mainland and other areas ($857 million) over expenditures going outside the state ($822 million). Federal expenditures, mostly military, amounted to $421 million, or almost half of the mainland dollars received by the state's economy; payments (tax and other) to the federal government totaled $191 million.

Principal Events, 1959.—The achievement of statehood distinguished 1959 in Hawaii's history. For more than a century, Hawaii had sought en-

trance into the Union as a state, particularly after 1898, when the Republic of Hawaii voluntarily brought about its annexation to the United States as an organized territory, with an elective legislature but under a governor and judiciary appointed by the president. Beginning in 1919, statehood bills were introduced before the U.S. Congress. Twenty-two times congressional committees held hearings on Hawaiian statehood in Washington or Honolulu.

Despite overwhelming evidence of Hawaii's political maturity and economic development, a variety of obstacles delayed admission. One was reluctance to give statehood to an area noncontiguous with the other states. There was a disinclination to expand the membership of the U.S. Senate, particularly for a tiny area with a small population. Despite its recent voting record, Hawaii was sometimes stereotyped as being Republican, and therefore its statehood aspirations were linked with those of Alaska's, since that territory had been typed as Democratic. Combining in a single bill statehood for both territories, as in 1954 and 1955, joined the opponents of statehood for either. Underneath many voiced objections to Hawaii probably lay unvoiced apprehension about admitting into the Union a state of such mixed ethnic composition.

The way for Hawaiian statehood was cleared in 1958 when Congress voted to admit Alaska. Hawaii leaders, particularly Delegate Jack Burns, worked diligently for Alaskan statehood, understanding that its admission would in itself answer most of the objections to Hawaiian statehood.

The effect was expected; the remarkable speed was not. On March 11, 1959, the U.S. Senate voted (76–15) to admit Hawaii, and the next day the House passed the bill (323–89). President Eisenhower on March 18 signed the measure which granted statehood to Hawaii under its 1950 constitution, modified by Congress in only a few minor respects.

The first state elections were held on June 27 (primaries) and July 28 (general). At the primary election, by a vote of 132,938 to 7,854, voters approved the state constitution and the conditions of admission; the latter related to exclusion of Palmyra Island and the disposition to the state of federally held land. Statehood became official on August 21, when the president signed a proclamation admitting Hawaii as the 50th state. William F. Quinn, the state's first governor, was formally inaugurated on August 29, five days after Hawaii's representatives in the U.S. Congress (see above, *Legislature*) took the oath of office in Washington.

Nature added to the year's excitement. Eruptions of Kilauea Iki, some 30 miles from Hilo on the island of Hawaii, began on November 14 and continued for weeks. (See also GEOLOGY.) Earlier, on August 6, another natural phenomenon, Hurricane Dot, battered the island of Kauai.

Even during the first months of statehood, its stimulus was felt in many ways. At the 1959 elections some 95% of registered persons voted, compared with ratios of 80% to 85% in recent years. During August and September alone, as many persons were naturalized in Hawaii as during the entire preceding year. The tempo of tourism, of business investment, and of economic development generally, was markedly increased. With statehood, a boom was on in Hawaii during 1959.

ROBERT M. KAMINS,
Administrative Assistant to U.S. Sen. Oren E. Long of Hawaii.

HAY. The crop of hay harvested in the United States in 1959 totaled 112.8 million tons, according to the U.S. Department of Agriculture. This yield was 7% less than the record 1958 crop of 121.8 million tons but still 5% above the 1948–57 average. Production by kinds in 1959, in millions of tons, was estimated as follows: alfalfa and alfalfa mixtures, 64.7; clover, timothy, and clover mixtures, 22.1; wild, 8.9; grain, 4.4; lespedeza, 4.4; soybean, peanut, and cowpea, 1.1; and other varieties, 7.1. The 1959 crop was cut from 69.4 million acres yielding an average of 1.62 tons per acre.

HAYWARD, Susan (real name EDYTHE MARRENER), American motion picture actress: b. Brooklyn, N.Y., June 30, 1919. She received the best actress award of the Academy of Motion Picture Arts and Sciences on April 6, 1959, for her highly emotional performance in *I Want to Live!*, a film based on the life of Barbara Graham, who was condemned for murder and executed in California in 1955. Similar recognition was bestowed on Miss Hayward by the New York Film Critics Circle in 1958, and she also won the best actress award at the 1956 Cannes International Film Festival for her portrayal of Lillian Roth in *I'll Cry Tomorrow*.

After attending high school in Brooklyn, she became a photographer's model. Her picture on the cover of a national magazine in 1939 attracted the attention of movie talent scouts, and she was called to Hollywood. She played minor roles in a number of films, beginning with *Beau Geste* in 1939, and first won critical acclaim for her portrayal of a vixen in *Adam Had Four Sons* (1941). Her later films included *I Married a Witch* (1942), *Reap the Wild Wind* (1942), *And Now Tomorrow* (1944), *The Hairy Ape* (1944), *The Saxon Charm* (1948), *Tap Roots* (1948), *David and Bathsheba* (1951), *The Snows of Kilimanjaro* (1952), *The President's Lady* (1953), *Demetrius and the Gladiators* (1954), and *Thunder in the Sun* (1959).

Susan Hayward, in the role of Barbara Graham in *I Want to Live*, for which she won the 1959 Academy Award for best actress.

UNITED ARTISTS

Her portrayal of Barbara Graham was the fifth of Miss Hayward's roles to be considered formally for Hollywood's highest accolade. She had received Academy Award nominations for *Smash-Up* (1947), *My Foolish Heart* (1949), *With a Song in My Heart* (1952), and *I'll Cry Tomorrow* (1955).

In 1944, Susan Hayward was married to actor Jeffrey (Jess) Barker, by whom she had twin sons and from whom she was divorced in 1954. On April 26 of the following year she was found suffering from an overdose of sleeping pills—an apparent suicide attempt, according to the police. She was married to Floyd Eaton Chalkley in 1957.

HEART DISEASE. Cardiovascular Surgery.—It has been shown in recent years that strokes may be caused by obstruction in the chest or neck of the large arteries which supply blood to the brain. A major breakthrough in the treatment of strokes due to this cause has been made by Michael E. DeBakey and associates at the Baylor University College of Medicine, Houston, Texas. They have been able to relieve paralysis in many of these patients by removal of the obstructing clot or by insertion of grafts to bypass the obstruction.

According to C. E. Drew and Ian M. Anderson, of London, England, profound body cooling with bypass of blood around the heart may permit surgical correction of heart defects that are otherwise virtually inoperable. In one case, the patient's mouth temperature was lowered to 15°C. (59°F.) by cooling the blood in a circuit outside the body. Hypothermia (body cooling) has also been used to prevent brain damage after resuscitation from cardiac arrest. Cooling lowers the brain requirement for oxygen, thus minimizing injury due to impaired blood supply.

Andrew Thevenet, Paul C. Hodges, and C. Walton Lillehei of Minneapolis, Minn., have been able to control Stokes-Adams syndrome (recurrent loss of consciousness due to cardiac stand-still) by electrical stimulation of a wire electrode inserted through the chest wall into the muscular wall of the heart. Since the electrode needs only very low voltage, the disadvantages of an external pacemaker—such as muscular twitching of the chest, chest pain, and skin ulceration—are avoided, and stimulation may be maintained for weeks or months if necessary. A small (1 by 2 by 4 inches) lightweight transistorized pacemaker with a self-contained battery may be worn by the patient.

Hypertension-Arteriosclerosis.—Great interest continues in the prevention and treatment of arteriosclerosis, the chief cause of coronary thrombosis with myocardial infarction and of strokes. Vigorous differences of opinion still exist as to the influence of diets with a high content of fat of animal origin. Continued studies of the effects of unsaturated fats in the diet have shown that these substances tend to lower high levels of blood cholesterol, especially if they are used to replace saturated fats. Several commercial preparations of margarine containing principally unsaturated fat are now available and can be used in place of butter and other foods containing principally saturated fats.

Vigorous research is progressing in the use of drugs which reduce cholesterol blood levels, probably by interfering with the formation of an intermediate substance within the liver. Such a drug (laboratory code MER-29) is under investigation, as to its value and toxicity, by the Wm. S. Merrell Company.

Irvine H. Page and Harriet P. Dustan, of the Cleveland (Ohio) Clinic, have studied a new antihypertensive drug, guanethidine, which differs from other blood pressure-lowering drugs in chemical structure and mechanisms of action. Tested in a small group of patients, it appeared to be an effective agent, with mild diarrhea as the principal untoward effect.

Several new drugs have become available for the treatment of high blood pressure and dropsy. These compounds are chemical modifications of chlorothiazide, the very valuable drug introduced in 1958. Early studies suggest that the newer drugs have certain advantages over the parent compound, but more extensive trials will be needed to establish their value.

Jerome W. Conn and coworkers at the University of Michigan reported that a synthetic steroidal spiralactone (SC 8109) was helpful in treatment of swelling associated with heart failure. It apparently acts in part by blocking the water- and salt-retaining action of aldosterone, an adrenal hormone which is produced in excessive amounts in congestive heart failure.

An exciting new approach to the treatment of clots in arteries and veins has been suggested by clot-dissolving substances (fibrinolysin). A fibrinolysin (plasmin) prepared from human blood has been made commercially available. It is said to be useful in the treatment of phlebitis (blood clots forming in veins), and in pulmonary embolism caused by detachment of these clots. Experimental studies in animals suggest that fibrinolysin may be effective in treating occlusion of coronary arteries by blood clots, but clinical application awaits further study in coronary occlusion in man. (See also SURGERY.)

Other Studies.—A report by Harold F. Dorn, of Bethesda, Md., summarized the mortality statistics of nearly 200,000 United States government life insurance policyholders for the period from July 1954 to December 1956. Although the death rate was greater among heavy cigarette smokers, the death rate among regular cigar and/or pipe smokers was not appreciably higher than in nonsmokers. No indication was found that regular cigar and pipe smokers experience a higher death rate from cardiovascular disease than nonsmokers, although the death rate from these diseases is higher among heavy cigarette smokers.

Myers Friedman and Ray H. Rosenman, of San Francisco, Calif., reported on a study of the effects of continuous emotional drive in a group of 212 men. Coronary artery disease was found to be seven times as prevalent among men trying to excel economically and socially as in men not under such habitual stress.

HEATING. See Index entry.

HEBRIDES, THE, or **WESTERN ISLANDS.** These 500 or more islands (aggregating 2,812 square miles) form an archipelago off Scotland's west coast and are part of the Scottish counties of Inverness, Argyll, and Ross and Cromarty. Diminished by emigration, the population was 53,000 in 1951. The islands are in two groups: the Inner Hebrides (among them Skye, Mull, Islay, Jura, Coll, Rum, Tyree, and Colonsay); and the Outer Hebrides, of which the principal islands are Lewis with Harris (1951 pop., 26,465), Barra, North Uist, Benbecula, and South Uist. The latter three islands have been designated as sites for the testing of guided missiles. Oats, barley, and potatoes are grown as subsistence crops. Sheep raising and the weaving of tweeds and other woolens are principal industries. Fishing has recently declined in importance.

HEENEY, Arnold Danford Patrick, Canadian government official: b. Montreal, Quebec, April 5, 1902. Canada's former ambassador to the United States (1953–57) was reappointed to that post on Jan. 17, 1959. Just one day earlier he had submitted to Prime Minister John Diefenbaker his report as chairman of the Civil Service Commission and thereby completed the assignment for which he had been recalled by then Prime Minister Louis St. Laurent in 1957. The report, aimed at improving the efficiency of the government service, recommends the first major changes in 40 years in Canada's Civil Service Act.

Heeney has been in Canadian government service since 1938. Educated at the University of Manitoba and Oxford University, he received law training at McGill University and practiced law in Montreal from 1929 to 1938. In the latter year he became principal secretary to Prime Minister W. L. MacKenzie King and was subsequently clerk of the Privy Council and secretary to the cabinet (1940–49). Entering the foreign relations field, he later served as under secretary of state for external affairs (1949–52) and ambassador to the North Atlantic Treaty Organization (1952–53) before his first appointment as representative of the Canadian government in Washington, D.C.

HELICOPTERS. See Index entry.

HERTER, Christian Archibald, U.S. secretary of state: b. Paris, France (of American parents), March 28, 1895. Following the resignation (announced April 15, 1959) of John Foster Dulles (q.v.) as secretary of state, President Eisenhower

WIDE WORLD

Christian A. Herter, named secretary of state by President Eisenhower on April 18, 1959, succeeding John Foster Dulles.

named Christian A. Herter to that post. Herter's appointment, after his more than two years' service as under secretary of state, came when the United States was entering a period of crucial international negotiations, especially in regard to the Western Alliance and the Soviet Union. Added to the diplomatic problems facing the new secretary was the fact that he succeeded a man of overwhelming drive and dominance, who for six years, almost singlehandedly and with little dependence on his subordinates, formulated American foreign policy.

After graduating from Harvard College in 1915, Herter entered the foreign service. His first assignment, in 1916, was as an attaché to the United States embassy in Berlin. In 1917–18 he returned to his homeland as a special assistant in the State Department. The following year he was in Paris as secretary to the American Commission to Negotiate Peace.

Herter next served as an assistant to Herbert Hoover when that administrator was director general of the American Relief Administration and when Hoover was secretary of commerce in the Harding administration. Herter left the government in 1924 to try his hand at publishing, and from then until 1928 he was coeditor and copublisher of the *Independent*, a journal of opinion. In 1929–30 he was a lecturer on international relations at Harvard.

In 1931 Herter was elected as a Republican to the Massachusetts House of Representatives, where he was speaker from 1939 to 1943. He was elected to the U.S. Congress in 1942, and for the next decade represented the 10th Massachusetts District. His main interests were in foreign affairs, and in 1947, at his urging, a special Congressional Select Committee on Foreign Aid was established. As the committee's vice chairman, Herter led a delegation to study conditions in Europe. The report which followed this trip was a vital factor in gaining bipartisan support for the Marshall Plan.

In an election in November 1952, Herter upset incumbent Paul Dever for the governorship of Massachusetts. He was re-elected in 1954, but declined to run in 1956. It was the latter year Harold Stassen launched a campaign to nominate Herter, rather than Richard M. Nixon, as the Republican vice presidential candidate. Herter gave no encouragement to this move and, at the National Convention in August, placed Nixon's name in nomination.

On Dec. 8, 1956, Herter was appointed under secretary of state, and he was sworn into office on February 21 of the following year. In this post he was overshadowed by his chief, John Foster Dulles, who conducted American foreign affairs from a "commanding position" that allowed little room for major actions by other State Department officials. Herter did, however, play an important role in the 1957 negotiations that followed the Middle East crisis of 1956. In February 1959, when Dulles took a leave of absence because of illness, he turned over his duties to Herter. Even before the announcement of Dulles' resignation on April 15, it was acknowledged that Herter would represent the United States in future major Western negotiations.

President Eisenhower delayed three days before naming Herter as Dulles' successor; but it was pointed out that Herter's nomination awaited the outcome of a thorough physical examination (he suffers from arthritis of the hips), and that the president was obviously upset by the resignation of a man who had been his close and trusted associate for over six years. On April 21, in order to allay any signs of division on the choice of Herter, the Senate acted quickly to confirm his appointment, and, on April 22, when he assumed office, President Eisenhower praised him as the "man best qualified to take over the office of the secretary of state."

(See also FOREIGN POLICY OF THE U.S.; UNITED STATES—*The United States in 1959.*)

HEYROVSKY, Jaroslav, Czechoslovak chemist: b. Prague, Czechoslovakia, Dec. 20, 1890. The first Czechoslovak to become a Nobel laureate, Heyrovský was awarded the 1959 Nobel Prize in chemistry for his development, 27 years earlier, of the polarographic method of electrochemical analysis. Along with the other Nobel winners, he received the prize (worth $42,600) at ceremonies in Stockholm, Sweden, on Dec. 10, 1959.

Educated at the universities of London and Prague, Heyrovský became an instructor at University College, London, in 1913. From 1920 to 1954 he was a member of the faculty of Charles University, Prague, becoming professor of physical chemistry in 1926. He left this post in 1954 to assume the directorship of the Institute of Polarography in Prague (an adjunct of the Czechoslovak Academy of Science), which the government had created for him.

Heyrovský's research has centered on the application of physical chemistry to analytical chemistry, specifically to the problem of accurately analyzing substances for their chemical content. In 1922 he developed polarography, an electrochemical method of analysis. Essentially polarography is the measurement of the current-voltage behavior of microelectrodes. It involves the electrolysis of a solution containing a small amount of a substance which is reducible in oxidation-reduction reactions. When increasing voltages are applied across the electrolytic cell, the microelectrode changes potential (polarization occurs). The resulting current-voltage curve is automatically registered by the polarograph, an instrument invented in 1925 by Heyrovský and an associate, M. Shikata.

Polarography has found application in determining traces of metals in alloys, ores, and such organic substances as certain medicinals and vita-

mins. It has also proved useful in theoretical chemistry in, for example, measuring reaction rates and rates of diffusion.

HIGH-FIDELITY RECORDINGS. See RECORDS, PHONOGRAPH.

HIGHWAYS. Highway construction in the United States again surpassed previous records in 1959. Estimates indicate that $10,504 million was spent during the year for improvement, maintenance, highway police, administration, and interest on highway debt of the nation's roads and streets. Of this total, construction expenditures accounted for $5,750 million, and $1,190 million was spent for preliminary engineering work and the acquisition of rights-of-way. Capital expenditures totaled $5,487 million for construction plus preliminary engineering and right-of-way costs on the improvement of 39,000 miles of principal highways, and additional capital expenditures of $1,453 million went for the improvement of 93,000 miles of local roads and streets.

Total road and street mileage in the United States is 3,479,000. Motor vehicle registrations in 1959 were expected to exceed 70 million, a gain of 3.1% over the previous year's total.

Federal-Aid Program.—The federal government's program of aid to the states for highway improvement, administered by the Bureau of Public Roads, was greatly enlarged by the Federal-Aid Highway Act of 1956. This act provided for construction, in a 13–16-year period, of the National System of Interstate and Defense Highways. This nationwide system of 41,000 miles of controlled-access expressways will serve 90% of all cities of 50,000 population or more. It is designed to handle adequately the traffic of 1975, when more than 100 million motor vehicles are expected to be registered. The cost of this network is being met with 90% federal and 10% state funds.

The regular federal-aid program, in which federal funds are matched 50–50 by the states, continued on a larger scale than ever before. Roads and streets eligible for federal aid in 1959 totaled about 815,000 miles, of which 260,000 miles (including the Interstate System) were in the federal-aid primary system, and 555,000 miles were in the federal-aid secondary system of farm-to-market and feeder roads.

Funds authorized by the 1956 Highway Act for the fiscal years 1957, 1958, and 1959 totaled $6,550 million and were allotted to the states in 1956 and 1957. The Federal-Aid Highway Act of 1958 provided additional funds for fiscal 1959, which were apportioned among the states on April 17, 1958. Included were $200 million more for the Interstate System, and a special fund of $400 million to finance primary, secondary, and urban projects which were placed under contract before Dec. 1, 1958, and completed within a year, as an antirecession measure.

On Aug. 1, 1958, apportionment of $3,400 million was made to the states in federal aid authorized by the 1958 Highway Act for the fiscal year 1960. This amount, the largest single federal-aid apportionment ever made, exceeded the total of all authorizations made during the first 24 years (1917–40) of federal aid for highways. The 1960 fiscal year apportionment included $2,500 million for the Interstate System and $900 million for primary, secondary, and urban highways.

The Highway Act of 1956 anticipated a close balance of authorizations paid out and tax revenues received, but this balancing was based on the life of the Interstate System, not on a year-by-year reckoning. Congress anticipated a surplus in the first few years, followed by several years of deficits which would be balanced by surpluses in the closing years of the program. The legislation permitted repayable advances from the general funds in the Treasury to the Highway Trust Fund to iron out this deficit-surplus problem. But a pay-as-you-go clause also included in the 1956 Highway Act had the effect of requiring a year-by-year balance. This limitation had no immediate impact on the Interstate System program, but as the fiscal year 1959 approached it was evident that the increased authorization called for in the 1958 Highway Act could not be met by the Highway Trust Fund revenues anticipated for the fiscal years 1959 and 1960. Accordingly, Congress in the 1958 act waived the pay-as-you-go clause for two years and directed that the full amounts authorized for fiscal 1959 and 1960 be apportioned to the states.

These and other financial provisions of the 1958 legislation which increased federal outlays advanced the day when the Highway Trust Fund would be threatened with a deficit, for this act made no commensurate provision for additional revenue, and the pay-as-you-go requirement would come back into effect after its two-year suspension. To meet this situation, the Federal-Aid Highway Act of 1959 increased the motor-fuel tax by 1 cent a gallon (from 3 to 4 cents) during the period Oct. 1, 1959—June 30, 1961. In addition, from July 1, 1961, to June 30, 1964, one half of the 10% tax on new automobiles and five eighths

APPORTIONMENT OF FEDERAL-AID HIGHWAY FUNDS AUTHORIZED FOR THE FISCAL YEAR 1961

Political unit	Primary, secondary, and urban program	Interstate System program	Total

of the 8% tax on motor vehicle parts and accessories are earmarked for the Highway Trust Fund rather than, as at present, for the general fund of the Treasury. The 1959 Highway Act also reduced the Interstate System authorization for the fiscal year 1961 from $2.5 billion to $2.0 billion; however, only $1.8 billion could be apportioned. The accompanying table shows the apportionment of funds to the states for the fiscal year 1961.

Federal-Aid Work in 1959.—Federal funds totaling $3,223 million were obligated in the federal-aid program during the fiscal year 1959. Completions of all federal and federal-aid projects resulted in the improvement of 32,828 miles of roads and streets at a cost of $3,275 million, including $2,095 million of federal funds.

On the Interstate System, work costing $1,325 million was completed in the fiscal year, of which $1,039 million was federal aid. Construction contracts were completed on 2,290 miles. Much of the year's expenditures was for preliminary engineering and right-of-way purchase.

On the federal-aid primary system, 7,135 miles of highway improvements were completed at a cost of $781 million, including $407 million of federal funds. Federal-aid secondary system improvements on 16,310 miles of farm-to-market roads cost $505 million, of which $261 million was federal aid.

Projects were completed during the fiscal year on 1,113 miles of roads in national parks and forests, on national parkways, and on flood-relief projects, at a cost of $75 million, including $65 million of federal funds.

Foreign Activities.—Since World War II the Bureau of Public Roads has assisted many countries in highway activities in cooperation with the Department of State, the Export-Import Bank of Washington, the International Bank for Reconstruction and Development, and the International Cooperation Administration. During 1959 established programs continued in Jordan, Liberia, Ethiopia, Nepal, Iran, Sudan, and the Philippines. Assistance was also planned for Laos and Yemen.

The Inter-American Highway.—Since 1930 the United States, through the Bureau of Public Roads, has assisted the Central American republics in construction of their portions of the 3,200-mile Inter-American Highway from Laredo, Texas, to Panama City. Mexico financed and built the 1,600-mile section within its borders. By 1959, 72% of the highway was paved and another 24% was usable the year round. It is now possible to travel by car from Laredo to San Isidro, Costa Rica—a distance of 2,725 miles. The next 150 miles to Concepción, a few miles beyond the Panama border, though under construction, were still impassible in late 1959.

Safety.—The Bureau of Public Roads promotes public safety by its research work in the design, construction, and the operation and use of highways. Planned and controlled access is required on all routes of the Interstate System, and is a factor in sharply reducing accident and fatality rates on these new freeways. This modern feature was one of many discussed in a recent broad study of safety carried out by the bureau under the 1956 Highway Act. Other vital safety factors include more extensive education, more effective enforcement, and safer vehicles. In 1959 the President's Committee for Traffic Safety continued its emphasis on the need for organized public support.

HONDURAS. This Central American republic is bounded on the northwest by Guatemala, on the southwest by El Salvador, and on the south by Nicaragua. The area, more than 80% of which is mountainous, is 43,227 square miles (with additional territories in dispute), and the population is 1,887,626 (1959 est.). The capital, Tegucigalpa (elevation about 3,200 feet), has a population of about 110,000 (1959 est.). The second most important city is San Pedro Sula, located on the north coastal lowlands, with a population of 71,217 (1959 est.) in the district and 27,519 in the urban area. Among the smaller cities are Puerto Cortés, Choluteca, La Ceiba, Santa Rosa de Copán, Tela, Trujillo, Comayagua, Danlí, and Juticalpa. According to the latest census (1950), ethnic distribution is as follows: mestizos, 91%; Indians, 6%; Negroes, 2%; and whites, 1%.

Government.—Honduras is a unitary state with a presidential structure in the central government which exercises great control over the departmental and local units. Governed by the constitution of 1957, Honduras in 1959 had a president (Dr. José Ramón Villeda Morales); 3 presidential designates; a 58-member single-chamber Assembly of Deputies; and a 5-man Supreme Court elected by the congress. Administration of the country's 17 departments is conducted through governors appointed by the president.

Education and Religion.—About 50% of the children do not receive any education, and many of the remainder attend school for 3 years at the most. Illiteracy of those 10 years of age and older is estimated at 60–65%. In 1957 there were 1,879 rural schools, including 91 private schools, providing 3 years of instruction. In the same year there were 437 urban schools, including 55 private schools, which provided a 6-year course. Progress is being made; there were 1,325 elementary schools in 1937 and 2,316 in 1957.

The United Nations Educational, Scientific and Cultural Organization (UNESCO) began to help reorganize the elementary school system in 1958. Of the 60 secondary schools (total enrollment about 7,000), more than half are located in Tegucigalpa and San Pedro Sula. The National University, located in new quarters in the city of Comayagüela, adjacent to Tegucigalpa, has about 1,000 students, including about 150 women. There are some vocational schools, the most important probably being the School of Agriculture at Zamorano, founded in 1943 by the United Fruit Company. It offers free courses in scientific husbandry, and its attendance is limited to 160.

Public education was allocated 12,971,433 lempiras in the 1959 budget.

Finance.—The budget for the calendar year 1959 was fixed at 89,593,938 lempiras (2 lempiras = U.S.$1), as compared with 92,400,000 lempiras in 1958. The internal debt increased sharply from 7,400,000 lempiras in 1954 to 26,600,000 lempiras in 1958, largely as a result of deficit financing. The external debt increased from 1,400,000 lempiras in 1954 to 7,200,000 lempiras at the end of 1957. Net international reserves showed improvement, however. They increased from $14.6 million at the end of June 1958 to about $18 million in June 1959.

Transportation and Communication.—Inadequate roads are retarding economic progress in Honduras, although great efforts at improvement have been made in recent years. There were only 24 miles of paved roads in 1955. No main highway crosses the country from east to west, and only horse or mule trails can be found in the entire eastern half of the country. The Inter-Oceanic Highway crosses the country from north to south, but parts of it are passable only in dry weather.

The three railroad lines, which have about 1,000 miles of track, all operate near the port cities of Puerto Cortés, Tela, and La Ceiba, and service mainly the banana industry. United Fruit Company and Standard Fruit Company ships call regularly at the three active ports of Puerto

Cortés and La Ceiba on the north coast and Amapala on the Pacific coast. Only Toncontín, completed in Tegucigalpa in 1955, meets international standards among 30 airports.

The government's domestic telephone service covers the most important population centers. There are 3,455 miles of telegraph lines to some 300 communities. The country's 17 radio stations include 7 in Tegucigalpa and 5 in San Pedro Sula. A 50-foot tower and 2,000-watt transmitter costing $280,000 were under construction in 1959 to provide television broadcasts for Tegucigalpa.

Agriculture and Industry.—About 83% of the people work in agriculture, which comprises about 50% of the gross domestic product (manufacturing accounts for 11.7%, and wholesale and retail trade for 11.3%). The total gross product rose 34% between 1948 and 1957, but manufacturing increased 116.2%, and utilities 550%. Agricultural practices are backward; there is only one plow for every 4.3 farms or for every 14.4 persons engaged in agriculture. Blowdowns destroyed about 2 million stems of bananas, the country's chief crop, by mid-1959, but exports for the full year were expected to approach those of 1958. The production of ginned cotton was about 76,000 quintals (1 quintal = 101.43 pounds) in 1958 but may fall to only 33,500 quintals in 1959. Acreage in cotton dropped from 11,000 manzanas (1 manzana = 1.7 acres) in 1958 to slightly over 2,000 in 1959. It was expected that coffee production would total 440,000 quintals in 1959, an increase of 10% over 1958. Honduras exports the least coffee of any Central American country.

Although richer in minerals than any other nation in Central America, Honduras lacks the iron and coal for heavy industry. The Mochito mine of the New York and Honduras Rosario Mining Company, developed in 1948, was producing 2,200,000 ounces of silver by 1957.

Light industry has been developing rapidly since the end of World War II. The Empresa Nacional de Energía Eléctrica (ENEE) was created in 1957 to plan hydroelectric development. Although the hydroelectric potential is estimated at 1,040,000 kilowatts, Honduras has less electric power than any country in the Western Hemisphere except Haiti. No power plant exceeds 5,000 kilowatts in total installed capacity, and rates are high. The country's first cement plant (near San Pedro Sula) began operations in July. Initial production is estimated at 84,000 quintals per month, but the potential is about 200,000.

Foreign Trade.—Honduras achieved a favorable trade balance in 1958 when exports rose to 143.6 million lempiras (from 129.8 million in 1957) and imports declined to 133.2 million lempiras (from 137.4 million the previous year). Shipments of bananas, the country's leading export, were valued at 75.2 million lempiras, an increase of 7.8 million over 1957. For the first 6 months of 1959 banana exports were estimated at 7 million stems, or 900,000 stems below the same period in 1958; for the full year 1959, exports were expected to reach 12–13 million stems, as compared with 13.5 million in 1958. Other major exports in 1958 included (in millions of lempiras) coffee, 21.8 (24.0 in 1957); lumber, 13.1 (15.6 in 1957); and silver, 4.9 (4.1 in 1957). About two thirds of Honduras' trade is with the United States, which, along with Canada, imported most of the banana crop in 1958. Cotton exports in 1957–58 went mainly to Japan, France, Belgium, and Italy. Commerce is also conducted with Germany and the United Kingdom.

Principal Events, 1959.—President Villeda Morales and the Liberal Party continued to put into effect their program of welfare and government-directed development. It was not contemplated that heavy public expenditures and deficit financing would result in unemployment and rising prices, but when these things occurred, many people in both political parties blamed the administration. Although the new labor code and social security law were not to go into effect until after August 31, businessmen immediately estimated that labor costs would be increased 18–20%. Wage rates remained the same, but fringe benefits increased—such as full pay during illness up to 8 months, severance pay on similar terms, 10 week's full pay for pregnant women workers, and employer-supported nurseries. The Standard Fruit Company indicated that it might terminate banana cultivation by December 1959, and the United Fruit Company planned to close 5 plantations.

A *cuartelazo*, or barracks uprising, led by Lt. Col. Armando Velázquez Cerrato, began in Santa Bárbara, 150 miles northwest of Tegucigalpa, early in February. The main resistance was broken by February 10, but bombings and street fighting continued in Tegucigalpa, and final surrender did not come until March 9. Another attack by insurgents was made on Gracias on May 11 but was repulsed. Colonel Velázquez Cerrato led another attempted coup on July 12, but it failed within a day. University students and professional people, as well as army officers, appeared to be in opposition to the government.

On January 5, Honduras presented its petition to the International Court of Justice at The Hague to adjudicate the long-standing boundary dispute with Nicaragua.

William S. Stokes,
Professor of Comparative Political Institutions, Claremont Men's College.

HONDURAS, British. See British Honduras.

HONEY. Honey production in the United States in 1958 totaled 265.6 million pounds with a value of $46.2 million, according to the U.S. Department of Agriculture. This yield was up 9% from the previous year's total of 243.9 million pounds and 13% above the 1952–56 average. The crop was produced by 5.4 million colonies, yielding an average of 49 pounds of honey. The states producing the largest crops were California, Minnesota, Florida, Wisconsin, and Texas.

HONG KONG. A British colony since 1841, Hong Kong is situated on the southeastern coast of China's Kwangtung Province and includes numerous islands off the Chinese mainland. The colony (area, 391¼ square miles) comprises the island of Hong Kong (32 square miles), on which is Victoria, the capital; the New Territories (with numerous islands, 356 square miles), leased in 1898 from China for 99 years; and the ceded territory of Kowloon (with Stonecutters Island, 3¼ square miles). A strip of water about one-fourth mile wide separates Hong Kong island from the mainland and provides a fine natural harbor for the colony, which is a thriving international seaport and a "listening post" for the free world to Communist China.

Population.—At the end of 1958 the civilian population was estimated at 2,806,000, the great bulk of which is Chinese and lives in Victoria and Kowloon. The non-Chinese population numbered 22,900, including 15,000 British subjects, 2,147 Americans, and 1,630 Portuguese. The influx of refugees from China, estimated at over 1 million since 1954, has posed serious problems for the administration. Resettlement of the squatter population continues; by June 30, 1959, resettlement areas and estates contained 286,313 persons. The New Territories are the site of several rapidly growing market towns and Tsuen Wan, an expanding industrial center.

Government.—The colony is administered by a governor (Sir Robert Black, who was installed on Jan. 23, 1958). He is assisted by a 12-member Executive Council headed by the commander of British forces (Lt. Gen. Sir Edric M. Bastyan), and a 17-member appointed Legislative Council.

Finance.—Government revenue for the fiscal year ending March 31, 1959, was HK$629,336,662; expenditure, HK$589,958,367. The largest single item of outlay was about HK$187 million for public works. (HK$1 = U.S.$0.175.)

Education.—Although education is not compulsory, the government has undertaken an ambitious seven-year plan to provide (by 1961) educational facilities for all children of primary school age. Primary school enrollment during the first five years of the plan has nearly doubled, increasing from 160,024 pupils in 1954 to 313,718 as of March 31, 1959. On that date there were 1,457 schools with a total enrollment of 435,774 students, of whom 181,790 were receiving government-aided education. Two teacher-training colleges (Grantham and Northcote) prepare 600 primary teachers annually. In 1959 the University of Hong Kong had 1,059 students; the technical college, 5,171.

Transportation and Communications.—In the fiscal year 1959, 50,061 vessels totaling 33,912,425 net tons entered and cleared the port; 1,127,882 passengers were embarked and disembarked. A government-owned railway links Kowloon with Shumchun (a distance of 22 miles) on the Chinese frontier and affords direct communication with Canton, Hankow, and Shanghai. In 1957, roads totaled 479 miles, of which 187 miles were situated on Hong Kong island, 166 miles in the New Territories, and 126 miles in Kowloon. The colony is served by 18 international airlines, which use Kai Tak Airport's new 8,350-foot runway that projects into Kowloon Bay and is suitable for all types of aircraft. In the fiscal year 1959 there were 9,858 international flights carrying 262,204 passengers to and from Hong Kong. The colony had 74,803 telephones in 1958.

Economy.—Although its traditional entrêpot trade continued to decline somewhat in 1958, Hong Kong's economy registered substantial gains during the year in manufacturing, construction, and tourism. Manufacturing provides employment for more than one half of the working population. In 1958 local manufactures accounted for 42% of the colony's export value and totaled HK$1,260,284,756. The important textile industry supplied export income of HK$230,059,583 in cotton piece goods alone, and an export value of HK$423,237,532 in outerwear, cotton yarn, shirts, and cotton singlets. Other consumer goods locally manufactured for export in 1958 included footwear (HK$97,733,101), enamelled and aluminum household utensils (HK$75,784,771), toys and games, furniture, and flashlights. Important industrial undertakings include shipbuilding and repairing, iron foundries, and rolling mills. The cost of private building construction in 1958 was HK$260 million, half again as much as in 1957. Tourism income was estimated at U.S.$62 million; a record 103,759 tourists visited the colony in 1958.

Agriculture employs over 100,000 persons; the output in 1958–59 included 84,718 metric tons of vegetables and 33,008 metric tons of rice paddy. Mineral production in 1958 was as follows (in metric tons): iron ore concentrate, 105,125; kaolin, 7,621; quartz, 4,484; graphite, 3,285; and feldspar, 1,653. Hong Kong's fishing fleet, the largest in the Commonwealth, comprised 7,421 junks in 1959.

Foreign Trade.—The value of Hong Kong's exports in 1958 was HK$2,988,801,712 (down less than 1% from 1957); imports, HK$4,593,733,632 (down about 11%). In the first half of 1959, exports totaled HK$1,025,918,545, of which 30% were listed as re-exports. Principal exports are textile yarns, fabrics, and manufactured articles, all of which were valued at HK$666,417,506 in 1958, and clothing, which had an export value of HK$525,114,151. Imports include foodstuffs, textile fibers, base metals, industrial raw materials, machinery, building materials, and pharmaceuticals. Hong Kong's chief customers in 1958 were the United Kingdom, which took 13% of total exports; Malaya, which received 12%; the United States, 11%; Thailand, 7%; and Indonesia, 7%. Main suppliers in 1958 were Communist China, which provided 30% of the colony's imports; Japan, which supplied 13%; the United Kingdom, 12%; and the United States, 10%.

Principal Events, 1959.—As of February 2, the Hong Kong government imposed controls on cotton cloth exports to Great Britain in accordance with an agreement reached in 1958 by a United Kingdom Cotton Board delegation and the Hong Kong Textiles Negotiating Committee. The colony will restrict for three years the quantity of cotton goods exported to the United Kingdom to 115 million square yards annually, or 4.1% less than the amount exported in 1958. The measure was taken to protect Britain's textile industry, which was unable to compete with the lower prices of cotton cloth manufactured in the colony. Efforts by the United States to obtain similar restrictions on Hong Kong's textile exports were reportedly opposed by local manufacturers.

Relations with Communist China became strained as a result of several intrusions by Chinese ships into Hong Kong waters. In January and May, Chinese gunboats allegedly violated those waters to seize junks piloted by Chinese citizens who were attempting to flee from Communist China.

A large-scale economic development program was in progress in the New Territories, according to a United Nations report released in March. The program stresses the building of dams and channels for irrigation, road construction, resettlement of unused areas, and agricultural improvements, all of which are designed to help accommodate the many refugees who have recently entered the colony.

Prince Philip, Duke of Edinburgh, visited Hong Kong on March 6–8. He laid the foundation stone of the Queen Elizabeth Hospital, Kowloon, which is to cost an estimated HK$60 million and is to be completed by mid-1962.

HORSE SHOWS. See SPORTS, GAMES, AND SHOWS.

HORTICULTURE. For the past three to five years, the eastern part of the United States and Europe have experienced a series of unfavorable spells of weather (see METEOROLOGY and CLIMATOLOGY). Winter months have been unusually cold and wet, with the summers hot and dry; and the winter of 1958–59 and the 1959 growing season were no exceptions. For all plants there is a limit of tolerance beyond which the combination of winter injury and drought becomes fatal; and others which survive become weakened. The marked increase in the number of dead plants as a result of infections from secondary organisms is a good indication of the stress which plants have undergone in recent years.

Undoubtedly these stresses have had much to do with the dying of trees and shrubs throughout the East. Wilts infecting maples, oaks, and sweetgums; phloem necrosis and Dutch elm disease; rusts on hawthorns, cedars, and junipers; borers in locusts; leaf miners in birches; and root and crown rots of beeches, apples, peaches, cherries, and roses have all become more serious. As specimen shade trees in landscape plantings and on streets and boulevards die out, the search for superior varieties of trees is intensified.

In the face of the steady rise in the Consumer Price Index (see COST OF LIVING), horticultural commodities did not vary much in price in 1959. In some items, prices actually declined, especially in the apple industry, where the large crop was ultimately sold at prices essentially the same as the cost of the containers. The small margin of profit in those horticultural commodities which are

considered risk items is of major economic concern.

New Developments.—The creation of parklike shopping malls in Toledo, Ohio, and Kalamazoo, Mich., to stimulate business and rejuvenate downtown business areas is of considerable interest to ornamental horticulture. The first prolonged downtown shopping mall experiments have had a marked effect not only on business (overall business in the landscaped areas increased by approximately 15%) but also upon taxes. In the two-block area landscaped in Kalamazoo, increases in valuation of personal and real property brought $35,000 in additional taxes to the city in 1959. (See also CITY PLANNING.)

The business side of horticulture is receiving considerable attention today. Trade magazines, conferences, and associations are devoting large portions of their time and space to problems of business management, sales, and merchandising. In the past the degree of success of the professional horticulturist was dependent almost entirely on his knowledge of plant behavior, whereas today an extensive knowledge of merchandising methods is required.

In contrast to the family-owned and -operated business so typical of agriculture, the business of horticulture is becoming more corporate. Where the purchase of land was formerly the major expense of establishing a business, the cost of equipment necessary to produce and market the crop, as well as the cost of physical facilities for storage of equipment and merchandise, and for the handling, packaging, processing, and marketing of the commodities, now frequently exceeds by several times the cost of the land itself.

In an effort to reduce labor problems, equipment has become a major capital expense item. Almost all phases of production are now mechanized, from pruning to thinning, cultivating, and spraying. Machines to harvest nearly all types of vegetables, nuts, and cranberries, as well as to dig and plant flower bulbs, trees, and shrubs, are in wide use. Machinery to harvest blueberries, cherries, strawberries, raspberries, tomatoes, and apples are being developed. Automatic and semiautomatic equipment is in use for handling, sorting, sizing, and packing many commodities.

In spite of these labor-saving devices, labor itself has become increasingly costly. Family labor and materials produced on the land have been replaced by hired help and manufactured materials. Growth regulators to control the development of the commodity, herbicides to control weeds, and chemicals to eliminate both air- and soil-borne insects and disease are complicated and expensive. Their proper use has become a science in itself, requiring the employment of skilled labor.

Obtaining capital to establish and operate a modern horticultural business has become a matter of major concern. This, accompanied by problems of taxes and inheritance, has forced most of the larger businesses to become incorporated and and to issue stock. The one-time family business has become divided into different phases of operation, employing specialists and consultants in production, processing, and sales. With this, the art of growing plants has been relegated to a more minor position, as business management assumes an increasingly important role in the industry.

New Plant Varieties.—Open competitions are held each year to determine the most outstanding new plants. The All-America Selections' council of judges made the following selections for 1960: Just Right, an F_1 hybrid turnip; Bronze Rocket, Golden Rocket, Orchid Rocket, Red Rocket, Rose Rocket, and White Rocket, a new first-generation (F_1) hybrid Rocket snapdragon series; Vanguard, a double, rose-pink F_1 hybrid double snapdragon; Glamour, a salmon-colored annual phlox; Toreador, a large, orange Climax class F_1 hybrid marigold; and Spun Gold, a golden-yellow marigold. Headliner and Mardi Gras were fall-flowering mums selected along with Pink Cherub, a pompon mum; the first two are walnut-coral and bicolored red and gold, respectively.

The American Rose Society sponsors the All-America Rose Selections from trials held in 23 official test gardens across the United States. For 1959 the winners were Starfire, a cherry-red grandiflora, and Ivory Fashion, a white floribunda.

The 1960 award winners of the All-America Gladiolus Selections, Inc., trials were Landmark, a cream-colored gladiolus created by D.W. White, of Ste. Thérèse, Quebec, and Little Pansy, a deep blue gladiolus created by Carl Fischer, of Minnesota.

Awards, 1959.—Horticultural awards presented in 1959 included the following:

American Association of Nurserymen's Norman Jay Colman Award: Dr. Kenneth F. Baker, University of California, Los Angeles.

American Horticultural Council citations: E. S. Boerner, New York; H. J. Kohankie, Ohio; F. F. Rockwell, Massachusetts; T. P. Reilly, New York; J. N. Ott, Illinois.

Liberty Hyde Bailey Medal: B. Y. Morrison, Washington, D.C.

F. H. Bartlett Medal: B. H. Slavin, New York.

American Pomological Society's James Pinchney Wilder Medal: M. B. Davis, H. P. Olmo, California; T. J. Talbert, Missouri; the New York State Fruit Testing Cooperative Association.

American Society for Horticultural Science: Alex Laurie Award in Floriculture to C. D. Paris and W. J. Haney, Michigan; C. G. Woodbury Award in Raw Products to J. N. Moore, A. A. Kattan, and J. W. Fleming, Arkansas; Joseph Harley Gourley Award in Pomology to C. B. Shear, Florida; Leonard H. Vaughn Award in Vegetable Crops to Margaret N. Lesley and J. W. Lesley, California; Leonard H. Vaughn Award in Floriculture to Sam Asen and N. W. Stuart, Maryland.

Massachusetts Horticultural Society's Awards for 1958: George Robert White Medal of Honor to C. L. Wirth, Washington, D.C.; Thomas Roland Medal to A. B. Butler, Massachusetts; Jackson Dawson Medal to L. C. Chadwick, Ohio.

Arthur Hoyt Scott Garden and Horticultural Award: Not awarded in 1959.

Associate in Horticulture, Agricultural Experiment Station, Purdue University.

HOSPITALS. In 1958, 6,786 hospitals in the continental United States, with a total of 1,572,036 beds, admitted 23,697,157 patients. The average number of patients each day was estimated at 1,322,938—an occupancy of 84.2%. A total of 3,742,028 births was recorded in 1958 by 4,992 hospitals. Hospitals with less than 50 beds comprised 36 per cent of all hospitals and reported 11 per cent of all admissions.[1]

In the 5,290 nonfederal hospitals providing predominantly short-term care, there were 609,732 beds and 21,683,528 admissions. An average 451,144 patients were in these hospitals each day; the average occupancy was 74.0% and the average length of stay was 7.6 days.

For all listed hospitals, total assets in 1958 were in excess of $15 billion, and total expenses exceeded $7 billion, of which $4.7 billion was for payroll expense.

There were 1,464,829 full-time workers in all listed hospitals (including full-time equivalents for part-time employees), an average of 111 workers per 100 patients. The average number of personnel ranged from 224 per 100 patients in voluntary short-term general hospitals to 34 per 100 patients in nonfederal psychiatric hospitals.

Hospital utilization, financing, and staffing are shown in the accompanying table, from the American Hospital Association journal, *Hospitals*, Part 2, for August 1959.

[1] Of all hospitals with 25 beds or more, 58 per cent were accredited. In the nonfederal short-term hospitals of this size, 61 per cent were accredited; while in the voluntary hospitals of the short-term group, 73 per cent were accredited, with 100 per cent accreditation in the hospitals with 300 beds or more.

U.S. HOSPITAL STATISTICS

Category	All hospitals	Voluntary short-term general and special hospitals
Number:		
1946	6,125	2,583
1958	6,786	3,203
Number of beds:		
1946	1,435,000	300,000
1958	1,572,000	424,000
Number of admissions:		
1946	15,674,000	9,553,000
1958	23,697,000	15,825,000
Average daily census:		
1946	1,141,000	231,000
1958	1,323,000	321,000
Percentage of occupancy:		
1946	79%	76%
1958	84%	76%
Number of births:		
1946	2,135,327	1,596,127
1958	3,742,028	2,731,884
*Number of full-time personnel:		
1946	829,000	361,000
1958	1,465,000	720,000
Full-time personnel per 100 patients:		
1946	73	156
1958	111	224
Payroll expense:		
1946	$1,102,000,000	$ 431,000,000
1958	$4,660,000,000	$2,076,000,000
Payroll expense per patient-day:		
1946	$2.93	$ 5.11
1958	$9.63	$17.71
Total expense:		
1946	$1,963,000,000	$ 848,000,000
1958	$7,133,000,000	$3,427,000,000
Total expense per patient-day:		
1946	$ 5.21	$10.04
1958	$14.74	$29.24

*Includes full-time personnel plus full-time equivalents of part-time personnel; excludes residents, interns, and students.

Recent Trends.—Since 1954, the number of hospitals has been slowly decreasing so that the 6,786 hospitals listed for 1958 approximates the total number (6,788) listed for 1950. This decline is due largely to the decrease in numbers of proprietary short-term hospitals, nonfederal tuberculosis hospitals, and nonfederal long-term hospitals. On the other hand, the total number of beds in the voluntary short-term hospitals has increased about 3% per year since 1953. Current data further confirm the established trends toward increases in personnel and finances. The ratio of admissions to population has risen steadily, particularly in the short-term nonfederal hospitals.

Progressive Patient Care.—An exciting new idea in hospital service is progressive patient care—care services arranged in accordance with the patient's individual needs. According to the U.S. Public Health Service, progressive patient care includes the following five elements integrated in a continuing patient care program: (1) intensive care unit for the critically ill; (2) intermediate care unit for patients whose condition has stabilized and who require medical care; (3) self-care unit for patients who are physically able to care for themselves and who require restorative or diagnostic care; (4) continuation care unit for long-term patients requiring prolonged care; and (5) an organized home care program that is hospital based.

Many studies are now being conducted regarding costs of such a program, quality of care received, design of facilities to facilitate this approach, and related factors. If such studies prove this concept of medical nursing care is a better approach to meeting the health needs of patients in the general hospital, considerable changes would be forthcoming in hospital construction, financing, third-party payments, and the like.

HOTELS. During the first nine months of 1959 the United States hotel industry had an increase in room sales of 4% over the comparable period of 1958. Average room occupancy was 67%, the same as in the previous year, but this represented a drop of 25% from the highest occupancy level, recorded in 1946. According to the latest (1954) available census, there were 24,778 hotels of six rooms or more, including about 15,000 hotels of over 25 rooms, of which more than 50% had more than 50 rooms; only 800 hotels had over 300 rooms.

Announced expenditures for new hotel construction during the first nine months in 1959 totaled $486 million. This included 90 new hotels, 36 additions to existing structures, and 24 new hotel-owned motor hotels, adding a combined total of 33,000 rooms. Average construction cost per room was $16,350 for new hotels, $11,403 for motor hotels, and $9,215 for new rooms in existing hotels.

In 1959, hotel directories listed 230 hotel chains, the fastest growing group being the Sheraton Corporation of America with 54 hotels and over 25,000 rooms. During the year several hotel chains set their sights on foreign markets, and those with overseas units announced plans for expanding these operations. The Hotel Corporation of America announced plans for a hotel in San Juan, Puerto Rico; Western Hotels created a subsidiary to operate a hotel in Mexico City to be completed in 1960; Hilton Hotels Corporation started construction on a hotel at Port of Spain, Trinidad; and Sheraton Corporation of America acquired the four Matson Navigation Company hotels in Hawaii. Zeckendorf Hotels Corporation, which controls six hotels in New York City, extended its operations by acquiring the Sherman, the Ambassador East, and the Ambassador West hotels in Chicago.

Among the larger hotels which opened during 1959 were the 800-room Pittsburgh Hilton in Pittsburgh, Pa.; the 600-room Sheraton-Dallas in Dallas, Texas; the 536-room Robert Meyer in Jacksonville, Fla.; and the Executive House in Chicago, Ill., with 448 suites and studio rooms. Hilton Hotels entered the airport hotel field with inns at San Francisco and New Orleans. New inns in Binghamton, N.Y., and Portland, Oreg., were added to the Sheraton holdings. The Shelter Island Inn in San Diego, Calif., also was opened.

Hotels outside the United States which were completed in 1959 included the Aruba Caribbean Hotel, Aruba, Netherlands Antilles; Howard Johnson Nassau Beach Lodge, Nassau, Bahamas; Nile Hilton, Cairo, Egypt; and the Ritz, Lisbon, Portugal.

The number of new motor hotels completed in the United States during 1959 indicates an increased demand by motorists for modern sleeping accommodations convenient to major highways. Among those opened were the Lake Tower, Chicago, Ill.; South Gate, Washington, D.C.; Marriott Key–Bridge, Arlington, Va.; Howard Johnson, Atlanta, Ga.; Charterhouses (Hotel Corporation of America) in Annapolis, Md.; and motels located at Newton and Waltham, Mass., Cleveland, Ohio, Alexandria, Va., and Bangor and Kittery, Maine.

Hilton Hotels entered the rapidly expanding credit card field in 1959 with the introduction of

its Carte Blanche, which is also honored by many hotels outside of the Hilton organization. Credit cards issued by the "big three" (Carte Blanche, American Express, and Diners Club), for which holders pay approximately $5 a year, took on more comprehensive proportions during the past year. Previously honored solely by hotels and restaurants, the cards are now used also for charging car rentals, air and rail tickets, and theater tickets.

WALTER O. VOEGELE.
*Late Editor, "Hotel Management."**

HOUSING. The year 1959 was characterized by several significant developments in housing in the United States. The volume of private housing built reached the second highest level in the history of the nation; housing costs—labor, material, land, and interest rates—nevertheless, continued to rise; and a higher proportion of the new housing accommodations were apartments. The federally supported aspects of the urban renewal program were retarded during the year because of shortage of funds, but many cities carried on their own neighborhood improvement programs. Several states gave attention to the matter of discrimination in public and private housing. Finally, after passing two housing bills which met with presidential vetoes, Congress in September passed a measure which the president approved and which became the Housing Act of 1959 (see below, *Congressional Action, 1959*).

Housing Demand.—The estimated number of households in the United States increased by 7.7 million, or about 18%, between March 1950 and March 1959, according to the U.S. Bureau of the Census. There were an estimated 51.3 million households in March 1959, compared with 43.6 million 9 years earlier. During the 9-year period, the total population of the continental United States increased about 16%, from 150.5 million to 174.5 million.

The total number of households increased by about 861,000 a year, on the average, during the period from 1950 to 1959. However, urban and rural-nonfarm households increased by about 955,000 a year, whereas farm households declined by about 100,000 a year during the same period. In March 1959 there were 45.9 million urban and rural-nonfarm households and 5.4 million farm households. In March 1950 the corresponding figures were 37.3 million and 6.3 million.

Of the 39.5 million married couples in 1959, only 1.1 million, or 2.8%, did not maintain their own households, according to the Bureau of the Census. This 1959 estimate of "doubled-up" married couples may be compared with the higher rate of 6.1% in 1949. The number of married couples who live in doubled-up quarters has dropped about 50% in the last decade.

Households in urban areas were estimated to represent 64% of all households; those in rural-nonfarm areas, 26% of the total; and those on farms, 10%.

Volume of New Private Housing.—The upward trend in new housing units built, which began in 1958, continued into 1959. The heavy volume of new construction of private housing in the spring and summer of 1959 was expected to result in approximately 1.32 million new privately owned houses and apartments for the year. This would be short of the all-time high of 1,352,200 new private nonfarm housing units started in 1950, but would exceed the second highest number of 1,309,500 in 1955.

* Mr. Voegele, who served as editor of the magazine from 1936, died in New York City on Nov. 24, 1959, shortly after this article was written.

EMERY ROTH AND SONS

Baruch Houses, a low-rent housing project on New York's East Side, was completed in 1959 at a cost of $30 million.

The trend toward a significant number of two-family and multifamily structures built, compared with the single-family structures, continued the momentum gained in 1958. For the first 7 months of 1959, 17% of all privately owned permanent nonfarm dwelling units started were in multifamily structures, and another 4% were in two-family structures, leaving 79% in single-family structures. The increased percentage of multifamily structures was due primarily to the shortage of lots within reasonable commuting distance of most cities. An important contributing cause, however, was the increased demand for rental units, especially on the part of the increased number of young couples and aged families. Many of the new apartments were in high rental brackets.

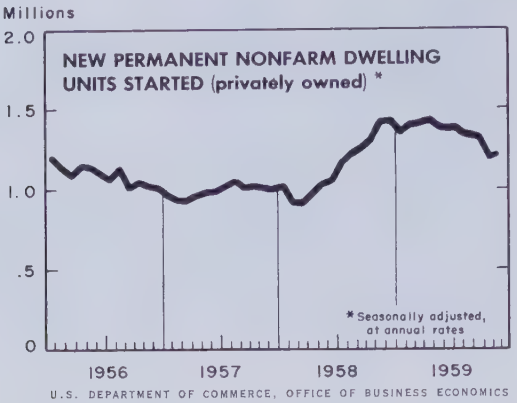
Conventional financing (that is, without government assistance) accounted for 71% of the nonfarm mortgage recordings of $20,000 or less at the end of the first 6 months of 1959, compared with 20% for mortgages insured by the Federal Housing Administration (FHA), and 9% for mortgages guaranteed by the Veterans Administration (VA).[1] This percentage distribution of the dollar amounts of mortgage recordings, however, does not reflect the distribution of the number of new housing starts because higher-priced houses tended to be financed with conventional loans and lower-priced housing with FHA-insured loans. A total of only 66% of the privately owned permanent nonfarm dwelling units started were financed with conventional loans, 25% were financed under the FHA, and 9% under the VA. (See also VETERANS ADMINISTRATION.)

Interest Rates.—Interest rates on home mortgages increased throughout the United States in 1959. In June, Congress voted an increase in the rate on VA-guaranteed mortgages from 4¾% to 5¼%. In September the rate on FHA-insured mortgages was increased from 5¼% to 5¾%. Interest rates on conventional mortgages averaged 6.1% in October 1959, according to a government report, compared with 5.65% a year earlier.[2]

Construction Costs.—The average cost of single-family dwelling units reached an all-time high of $13,750 by mid-1959. Residential building costs

[1] The percentage of mortgage defaults remained extremely low during 1959. By midyear (June) the VA announced that only 44,153 loans, representing 1.14% of all VA-guaranteed home loans outstanding, were in default. Of these, only 4,872 were listed as serious defaults, with foreclosure probably imminent. The FHA announced that approximately 14,702 of its mortgages were in default, representing only 0.54% of all insured home mortgages outstanding. Of these, foreclosure was imminent among 6,109.

[2] There was some variation in interest rates on conventional mortgages in different regions—from 5.85% in the Northeast to 6.5% on the west coast. The VA and FHA rates, of course, were the same in all regions.



climbed 5 points between July 1958 and July 1959 to 138.2 on the E. H. Boeckh Index (1947–49 = 100). The increase in the cost of building resulted from the increase in both wages and materials. Union wages climbed 7.6 points during that 12-month period to an estimated 170.0 by July 1959. This increase resulted from such rises in hourly wages as those in plumbing and heating, from $3.24 to $3.39; in painting and decorating, from $3.06 to $3.19; and in electrical work, from $3.55 to $3.68. Wholesale prices of construction material increased 5.8 points to 135.4 by July 1959. Contributing primarily to this gain were advances in the prices of lumber, including millwork and plywood, plumbing equipment, and structural clay products.[3]

Another factor contributing to increased housing costs in 1959 was the continued rise in land prices, due largely to the scarcity of lots in most cities. In many cities the price rose to between $10,000 and $12,000 per acre (where land had cost only $3,000 to $5,000 per acre four or five years ago). Some years ago land generally represented approximately 10% of the total cost of house and lot, but in 1959 in many cities it was found to represent between 15% and 20% of this total.

Vacant Dwelling Units.—The supply of available vacant dwelling units for sale in the United States remained low (approximately 1%) in 1959 despite the high rate of new home construction. However, the percentage of vacant units for rent was appreciably higher. During the third quarter of 1959, according to the Bureau of the Census, 8.8% of the rental units in the South, 8.6% in the West, 6.3% in the Northwest, and 3.5% in the Northeast, were vacant. Many of the vacant units were substandard in quality, but there also were some new apartments vacant, especially in cities in the South and West. The overall vacancy picture, however, was not alarming since it represented little change from 1958 for most communities.

Urban Renewal and Public Housing.—The urban renewal program, known as the Title I Program—a section of the Housing Act of 1949 (Public Law 171) that makes possible federal-city slum clearance programs—continued in 1959. Under this program a city is permitted, through condemnation or negotiated purchase, to acquire slum areas and parcels of substandard housing and to resell the land to private developers at an economical price.[4]

In 1959 the federal Housing and Home Finance Agency (HHFA) approved the 1,000th "workable program" for the prevention and elimination of slums and blight under Title I. By mid-year, the HHFA announced that there were nearly 400 cities with which its Urban Renewal Administration (URA) had contracts, for about 650 projects. (Most of the large cities had projects under way, but half of the cities having URA contracts had a population of less than 30,000.) Those aspects of the urban renewal program requiring federal grants-in-aid were retarded during 1959 by the scarcity of federal funds available for this purpose. However, in many cities neighborhood improvement programs not requiring federal monies proceeded at a rapid rate.

Only 11,500 new units of federally sponsored low-rent public housing, under Public Law 171, were initiated during the first seven months of 1959 (and 13,100 previously started units were completed during this period). However, the government announced that many low-income families were accommodated in the approximately 100,000 vacancies that occur in public housing each year.

Discrimination in Housing.—There was considerable activity in the form of anti-bias laws during the year. Four states—Colorado, Massachusetts, Connecticut, and Oregon—became the first to adopt laws forbidding racial discrimination in the sale or rental of private housing. Several other states had previously barred discrimination in the sale or rental of homes involving federal financing.

Congressional Action, 1959.—Although Congress had expected to enact a new broad-scale housing law early in the year, the Housing Act of 1959 was not signed by President Eisenhower until September 23. The delay was caused in part by disagreements tying up the legislation in the House of Representatives for a part of the time, and by presidential vetoes of two measures, one on July 7 and the other on September 4, before a measure was finally sent to the White House that the president felt he could approve.

The first bill passed by Congress would have authorized $900 million for a two-year program of urban renewal and 145,000 additional public housing units for future years, among other authorizations, and was vetoed by the president because he felt it was "extravagant," "inflationary," and "not needed." An attempt was made by Congress to override the veto, but it failed. A second bill was passed by Congress in August. It reduced the urban renewal authorization to $650 million for one year and the public housing authorization to 37,000 units. There also were some other changes, but this bill likewise was vetoed.

Some of the provisions of the third bill passed by Congress, which became the Housing Act of 1959 (Public Law 86–372) are summarized below.

FHA Insurance Programs. *FHA Mortgage Insurance for Sales Housing.*—The maximum amount of a mortgage which can be insured by FHA under the Section 203 sales housing program was increased from $20,000 to $22,500 for a one-family house, and from $20,000 to $25,000 for a two-family house. A new down-payment schedule for

[3] The Consumer Price Index, as differentiated from the cost-of-construction indexes, also reached an all-time high in 1959. For all items, according to the U.S. Department of Labor, the July index stood at 124.9 (1947–49 = 100). The index for housing alone stood at 129.0, the index for rents stood at 139.6, and for foods, 119.4. These indexes indicate the extent to which the increase in housing costs have outstripped the increase in food. (See also COST OF LIVING.)

[4] In order that a city may qualify for federal assistance under this program, it must have an approved "workable program" which promises enforcement of local housing codes, a comprehensive plan for future community development, a study of the community's neighborhoods in order to determine treatment needs to eliminate and arrest the spread of blight, an effective administrative agency to carry out the program, adequate financing to meet the city's redevelopment responsibilities, a means of relocating displaced families whose homes are demolished, and active community support and participation.

sales housing under the regular Section 203 program and the Section 220 urban renewal housing program was authorized as follows: up to $13,500, down payment of 3%; $13,500 to $18,000, 10%; and over $18,000, 30%.

Low-Cost Housing in Outlying Areas.—Provisions of the FHA Section 203(i) program of mortgage insurance for low-cost housing in outlying areas were changed by increasing the maximum mortgage amount from $8,000 to $9,000; by making existing housing eligible for mortgage insurance; by permitting the FHA to accept VA construction inspections; and by removing a separate insurance ceiling on certain farm housing which may be insured under this program.

Mortgage Maximums for FHA's Regular Rental Housing Program (Section 207).—The maximum amount of a mortgage which can be insured by FHA under its regular Section 207 rental housing program was increased from $12.5 million to $20 million. Per-room and per-unit mortgage limitations were increased as follows: $2,250 per-room limitation increased to $2,500; $8,100 per-unit (for efficiency units), increased to $9,000; $2,700 per-room for elevator structures, increased to $3,000; $8,400 per-unit for efficiency apartments in elevator structures, increased to $9,400; and $1,000 additional amount per-room for high-cost areas, increased to $1,250.

FHA Mortgage Maximums for Trailer Courts.—The $1,000 per-space mortgage limitation for trailer courts and the $300,000 mortgage limitation for trailer courts were increased to $1,500 and $500,000, respectively.

FHA Cooperative Housing (Section 213).—FHA mortgage limitations per project, per unit, and per room were increased for management-type cooperative housing.

FHA Mortgage Insurance for Nursing Homes.—A new program of FHA mortgage insurance for privately owned nursing homes was authorized. The property can be a new or rehabilitated nursing home, and the insurable mortgage cannot exceed $12.5 million or 75% of the estimated value of the property.

Housing for the Elderly. *New FHA Mortgage Insurance Program.*—A new Section 231 authorizing FHA mortgage insurance for both nonprofit and profit-making rental housing for the elderly was added to the National Housing Act. Property eligible for mortgage insurance under this program includes rental housing consisting of eight or more new or rehabilitated living units, not less than one half of which are specially designed for the occupancy of elderly persons. The property covered by the mortgage can include such commercial and special facilities as the federal housing commissioner deems adequate to serve the occupants. There was also a per-unit limitation of $9,000 for garden-type apartments and $9,400 for elevator-type apartments, except that these limitations can be increased by $1,250 per room in high-cost areas.

Direct Federal Loans.—A new program of direct federal loans for rental housing for the elderly was authorized. Eligible borrowers are private nonprofit corporations; eligible property includes new or rehabilitated rental housing structures and such related facilities as dining halls, community rooms, infirmaries, and other essential service facilities. A loan cannot exceed 98% of the total development cost.

Federal National Mortgage Association. *Increased Dollar Limit for Mortgages Purchased.*—The limit on the amount of a mortgage which may be purchased by FNMA was increased from $15,000 (for each family residence or dwelling unit covered by the mortgage) to $20,000 if purchased in its secondary market operations, and from $15,000 to $17,500 if purchased in its special assistance operations. Section 220 urban renewal housing was excepted from the dollar limits.

Urban Renewal and Planning. *Grant Authorization.*—The authorization for capital grant contracts and other grants for assistance to urban renewal was increased by $350 million, as of the date of enactment of the Housing Act of 1959, and by an additional $300 million on July 1, 1960.

Nonresidential Redevelopment.—The amount of the urban renewal grant authorization available for nonresidential redevelopment projects was increased from 10% to 20%.

State Loan Ceiling Removal.—The 12½% ceiling on the proportion of loan funds which can be expended in any one state was removed from the urban renewal law.

Relocation Payments.—Urban renewal relocation payments were authorized to be made when the displacement from the urban renewal area is a result of any governmental activity in the area, code enforcement, or programs of voluntary repair and rehabilitation. Prior to this new law, relocation payments were available only where displacement resulted from an urban renewal project. The maximum amounts of relocation payments were increased from $100 to $200 when made to individuals and families, and from $2,500 to $3,000 when made to business concerns.

Statewide Planning.—The Housing and Home Finance administrator was directed to encourage the utilization of local public agencies established to operate on a statewide basis in behalf of smaller communities within the state which are undertaking urban renewal programs. The governing body of the community must approve, by resolution or ordinance, the utilization of the state agency.

Community Renewal Programs.—The housing administrator was authorized to contract to make grants, up to two thirds of cost, for the preparation or completion of community renewal programs which would include identification of slum or blighted areas in the community, measurement of blight, determination of resources needed and available to renew such areas, identification of potential project areas and types of action contemplated, and scheduling of urban renewal activities.

Increase in Authorization for Federal Grants for Planning.—An additional $10 million was authorized to be appropriated for federal matching grants to assist state and urban planning.

Urban Planning Grant Program Broadened.—The scope of the urban planning grant program was broadened by authorizing federal matching grants to state planning agencies for the provision of planning assistance to municipalities having a population of less than 50,000 (previously 25,000); to counties with a population of less than 50,000 (previously only to counties with populations of 25,000 or more in cases of disaster); any group of adjacent communities having a population of less than 50,000 and common planning problems resulting from rapid urbanization; and to any cities and counties which have suffered from major disaster (cities and counties of 25,000 or more with major disasters previously eligible).

Low-Rent Public Housing. *Authorization of Additional Low-Rent Public Housing.*—New contracts were authorized for federal financial assistance to an additional 37,000 units of low-rent public housing.

Declaration of Policy.—The new law declares that it shall be the policy in the development of low-rent housing to make adequate provision for larger families and for families consisting of elderly persons.

Rents and Income Limits.—The statutory ceilings on family income for both admission and continued occupancy were eliminated. The local housing agency, with approval of the Public Housing Authority (PHA), was authorized to establish income limits and rent limits (subject to 20% gap between upper rental limit for admission and lowest rent on adequate private housing). In the case of housing for families displaced by governmental action, the required 20% gap was reduced to 5%.

College Housing. *Increase in Loan Authorization.*—The revolving fund for college housing loans was increased by $250 million. Of this increase, $25 million may be made available for "other educational facilities" such as dining halls and student centers, and $25 million may be made available for student nurse and intern housing facilities.

Armed Services Housing. *New FHA Mortgage Insurance Program for Military Housing.*—A new FHA Section 810 mortgage insurance program to provide not more than 5,000 units of housing for military and essential civilian personnel was authorized.

Farm Housing Research.—The authority of the Housing and Home Finance Agency to make grants to land-grant colleges for farm housing research was continued until June 30, 1961. The grants cannot exceed $100,000 during the two-year period beginning July 1, 1959.

HUMAN RIGHTS. See Index entry.

HUMPHREY, Hubert Horatio, Jr., U.S. senator: b. Wallace, S. Dak., May 27, 1911. On December 30, 1959, Humphrey became the first major declared candidate for president in 1960, formally announcing his entry in the race for the Democratic nomination and his intention to run in the Wisconsin (April 5), District of Columbia (May 3), Oregon (May 20), and South Dakota (June 7) primaries. He recognized, he said, that it would be "an uphill fight." Failing selection by his party at its July convention, he faced a contest for his Senate seat in November.

After a college career interrupted by the depression, when he worked in his father's drugstore, Humphrey took his B.A. degree with honors at the University of Minnesota in 1939. While doing graduate work at the Universities of Louisiana (M.A. 1940) and Minnesota, and in 1943–44 at St. Paul's Macalester College, he also taught political science.

In his first try for elective office, Humphrey ran unsuccessfully for mayor of Minneapolis in 1943. The following year he was instrumental in bringing about a merger of the state's Democratic

and Farmer-Labor parties, a coalition that has since been the source of his political strength. He ran again in 1945 for the Minneapolis mayoralty and won, and in 1947 he was re-elected by the biggest margin in the city's history.

Humphrey first appeared on the national political scene as a delegate to the Democratic National Convention of 1948 in Philadelphia. Here he made a speech that was considered crucial in winning inclusion in the party's platform, over bitter Southern opposition, of a strong civil rights plank. In November 1948 he became the first Democrat ever sent to the U.S. Senate by the people of Minnesota. In the Senate he became a major spokesman not only for civil rights but for federal aid to education and housing, economic aid to underdeveloped countries, disarmament, and the extension of bans on nuclear tests. He is chairman of the Senate Subcommittee on Disarmament. In December 1958 he was much in the news as a result of his eight-hour interview with Soviet Premier Khrushchev in the Kremlin.

When the Humphrey-for-President Committee was established in mid-July 1959 the senator called for a Democratic program of "sane liberalism and prudent progressivism," to be led by "a walking, talking liberal"—a fairly accurate description of himself.

HUNGARY. A Communist-ruled people's democracy in central Europe, Hungary is bounded on the north by Czechoslovakia, on the east by Rumania and the Ukrainian SSR, on the south by Yugoslavia, and on the west by Austria. It occupies an area of 35,912 square miles and has an estimated population (March 31, 1959) of 9,898,000, of which about 40% is urban.

According to the 1949 census, Hungarians comprise 94.6% of the population; there are small Slovak, Rumanian, Yugoslav, and German minorities. The capital and principal city is Budapest, which, with its suburbs, has a population of 1,850,000 (est. 1957). Other important cities, with 1957 estimated populations, are Miskolc, 150,000; Debrecen, 130,000; Pécs, 110,000; Szeged, 100,600; Györ, 66,000; and Kecskemét, 64,000.

Government.—According to the constitution of 1949, the highest organ of the state is the unicameral National Assembly. When this body is not in session, it is represented by the 21-member Presidium of the National Assembly. Both these agencies, as well as the cabinet, are controlled by the Hungarian Socialist Workers Party (HSWP)—another name for the Communist Party—and merely ratify decisions made at the top level of the party. The president of Hungary is István Dobi; the premier is Ferenc Münnich; and János Kádár is first secretary of the HSWP's Central Committee.

The HSWP, which claimed 450,000 members in 1959, is the guiding force in the country's political, social, and economic life. It exercises power through its various branches and organizations and through auxiliaries which it controls, the most important of which are the People's Patriotic Front (PPF) and the youth, labor, and women's organizations. The PPF is a Communist "mass organization" which includes, besides the HSWP, groups willing to cooperate with the Communists. The members of the central government and local governments—the people's councils—are drawn exclusively from the PPF and are either Communists or their collaborators.

Education.—In 1946 the educational system was secularized and subordinated to full state control. Four years of elementary and four years of secondary schooling is compulsory between the ages of 6 and 14. The educational system was reorganized in 1959 to combine students' training with part-time work in industry and agriculture. In 1957–58 there were 1,259,114 pupils enrolled in the general schools, 126,500 in secondary schools, and 32,944 in the six universities and other institutions of higher education. In 1958–59 the number of university students totaled 31,600. The highest scientific institution is the Hungarian Academy of Sciences, which has been completely reorganized on the model of the Soviet Academy of Sciences. Under its auspices the first experimental atomic reactor in Hungary was put into operation on March 25, 1959.

Religion.—About two thirds of the people of Hungary are Roman Catholics. Protestants include members of the Reformed Church (1,954,000 in 1955), Lutherans (432,000), and Baptists (14,000). Although full separation of the church and state is constitutionally established, religious affairs are supervised and controlled by the State Office for Church Affairs, which was reorganized in 1959. The state exerts its influence on the clergy by fostering movements such as the Catholic Opus Pacis, which is cooperating with the government.

In April 1959, several Roman Catholic leaders, including József Grösz, archbishop of Kalocsa, swore allegiance to the state. On April 3, Dr. Imre Papp, spiritual director of the Roman Catholic Seminary of Budapest, and two other members of the staff were removed from their posts for political reasons, and on April 9 some students refusing to pledge complete obedience were also expelled. On April 14 the Vatican accused Hungary of trying to turn the teachers and the students into a kind of "ecclesiastical police." Pope John XXIII denounced on May 17 the interference of the state in the affairs of the church, protested against the government's attempts to control the appointments of church ecclesiastics, and accused the government of fomenting a schism within the church by having established the Opus Pacis movement. On July 11 the Vatican protested against decrees which authorized the State Office of Church Affairs to fill all church posts vacant more than 90 days. However, the government appointed four new Roman Catholic bishops on July 25. József Cardinal Mindszenty remained in the United States legation, to which he had fled after the revolution of October 1956.

National Defense.—Under the terms of the 1947 peace treaty, Hungary's army was to be limited to 65,000 men, and its air force to 5,000. In 1955, foreign observers estimated Hungarian armed forces at 12 divisions, totaling 165,000 to 180,000 men. Because of its failure in the October 1956 revolution, the army was drastically reorganized in 1957. The Soviet government announced on Jan. 30, 1959, that the total strength of its forces in Hungary had been reduced.

Finance.—The 1959 national budget called for expenditures of 52.1 billion forints (up 11.9% over 1958) and revenues of 52.9 billion forints (up 11.8%). The expenditures were distributed as follows: national economy, 28.9 billion forints; social and cultural expenditure, 16.3 billion (up 17% from 1958); defense, 4.9 billion; and administration, 2.0 billion. In February 1959, Minister of Finance István Antos announced that most of the income would come from the increased production by state industry. In 1959, Hungary reportedly invested 14.7 billion forints toward economic and social development. The bulk of the investment will go into development of electric power and coal mining industries, and the production of diesel engines, high-tension equipment, telecommunications equipment, and instruments. About 1 billion forints were allocated for cooperative farm investment.

Transportation and Communications.—Hungary had 8,220 miles of railways and 17,915 miles of roads in 1956. In 1954 there were about 170,000 motor vehicles of all types. There are 871 miles of navigable waterways, the most important being the Danube and Tisza rivers. In 1956 there were only 6 large river freighters with tonnages ranging from 1,800 to 3,000. Hungary had 347,672 telephones in 1957 and 1,274,000 licensed radio receivers in 1956. According to official reports there has been in recent years a constant increase of railway, truck, and Danube traffic.

Agriculture.—With a farm population approximating 43% of the total population, and with arable land amounting to 62% of the total area of the country, agriculture is exceedingly important to Hungary's economy. Chief crops and estimated 1957 output (in thousands of metric tons) were: wheat, 19,549; maize (corn), 3,284; barley, 968; rye, 487; oats, 263; sugar beets, 1,948 (1956); potatoes, 2,055 (1956). In 1958 there was a considerable increase in livestock. The agricultural plans provide for further expansion of cultivable and irrigated land, and increases in number of livestock and production of cereals and fruit.

In 1959 the collectivization drive was intensified, and indirect coercive methods were used by the government to compel peasants to accept collective farming. At the end of March 1959 there were 4,517 collective farms, or 1,010 more than at the end of 1958. Communist First Secretary János Kádár reported on April 4, 1959, that 1,300 cooperative villages containing 354,000 farmers had been formed in the two-month collectivization drive, and that 50% of Hungary's arable land belonged to the socialist sector. By July this figure was increased to 61.5%. Collectivization and the mechanization of agriculture made such quick

progress that Hungary found it necessary to increase imports of machinery and fertilizers. According to an agreement signed in Moscow on April 24, the USSR undertook to supply Hungary with tractors, combines, and other farm machinery.

Industry.—In 1958 the overall industrial production was 4% over the planned figures. Productivity in heavy industry rose by 12%, and in the light and food industries by 5%. The current Three-Year Plan (1958–60) is designed to step up production for export and to accelerate the completion of investment projects. The government in 1959 drafted a long-range Five-Year Plan (1961–65) to develop the petroleum, chemical, and light industries, and to further decentralize industry, as 51.9% of the country's entire industrial system is concentrated in Budapest. The National Planning Bureau has decided to relocate 12 new projects originally scheduled for Budapest.

The economic plan for 1959 provided the following increases over 1958 production in the basic industries: electric power, 10.4% (6.5 billion kw.-hr. in 1958); machinery, 10.7%; chemicals, 6.3%; mining, 3.8%; food, 4.2%; and light industry, 3.2%. Industrial production in 1958 was reported as follows (in thousands of metric tons): coal, 24,200; crude steel, 1,627; bauxite, 1,053; crude oil, 829; and aluminum, 39.

An electric power station at Tiszapalkonya was put into operation in July 1959; it is expected to supply one fifth of the electric energy in Hungary. Construction was also begun on another huge 200,-000-kw. plant at Százhalombatta, 20 miles south of Budapest. Hungary has reported new discoveries of oil at Battonya and Orosháza, and of natural gas at Tótkomlós and Kaszaper. (See below, *Principal Events, 1959.*)

Foreign Trade.—Soviet industrial assistance to Hungary in 1958 increased markedly in value to 3,413 million rubles. Hungary's trade with Communist countries continued to increase in 1958, when it comprised 71.8% of Hungarian foreign trade. There has been an expansion in trade with other countries as well. However, trade with China declined from exports of 262 million rubles in 1955 to 229 million in 1958. Hungary aimed to increase her trade in 1959 by 13.6% over that of 1958, with the ultimate goal of becoming self-supporting.

Principal Events, 1959.—The political, economic, and cultural life of Hungary still bears the wounds of the revolution of October 1956. Some participants in the revolution have recanted their "mistakes" and declared their allegiance to the Communist Party. With few exceptions, the partial amnesty announced on April 2 did not include those persons who had been involved in the 1956 revolt. One of those amnestied was Zoltán Tildy, former president of Hungary and a member of the Imre Nagy cabinet, who had been sentenced to six years in prison.

Purges of suspected and distrusted persons continued, and executions of some persons who took part in the 1956 revolution were reported. In April the well-known professor of psychology, Ferenc Mérey, and the journalist, Sándor Fekete, were sentenced to imprisonment for alleged "subversive antistate" activities. On April 4 the International League for the Rights of Man charged that the Hungarian government had instituted criminal procedures against 6,000 of the 21,000 refugees who had returned to Hungary under promises of amnesty. The government denied the charges. Since 1957 about 42,000 Hungarian citizens out of the 200,000 who fled abroad during the 1956 revolt had returned to Hungary.

It was announced on September 26 that the government had permitted the rebirth of the Hungarian Writers Union, a center of the agitation that had led to the October 1956 revolution. The president of the union is József Darvas, former minister of agriculture, and its general secretary is Imre Dobozi, a leading journalist. Gyula Kállai, a member of the Communist Central Committee, warned, however, that the regime would not allow artistic or literary activity "aimed against the legal order of the state."

In line with Soviet policy, much energy is being spent in promoting cooperation between Hungary and other Communist countries. Hungary participated in the meeting of the Soviet bloc's Council for Mutual Economic Assistance at Tiranë, Albania, on May 13–16, which agreed on further integration of the economies of the member states.

Much stress is put on exchanges of official visits by the leaders of Communist states. During his visit to Czechoslovakia on February 18–21, Communist First Secretary János Kádár commended that nation for successes in industry and agriculture, and attacked Yugoslavia for "revisionism." On June 4–6, Soviet Premier Khrushchev stopped off in Budapest while on his way to Moscow from Albania. A delegation led by Hungarian Premier Münnich visited the Mongolian People's Republic, North Vietnam, China, and North Korea in April and May. Later, on July 29, the Hungarian Parliament ratified a new Chinese-Hungarian friendship treaty.

Relations between the United States and Hungary remained strained. The United States rejected the Hungarian note of Jaunary 27 requesting the termination of the "absurd abnormal" relations between the two countries on grounds that the note implied threats of retaliation unless the United States agreed to negotiate. On July 6 the Hungarian government restricted the movement of the members of the United States legation to within 25 miles of the center of Budapest because the legation's activities allegedly constituted a constant danger to the Hungarian state. The United States retaliated by restricting the movement of Hungarian diplomats in the United States to within 25 miles of New York City and Washington.

During Soviet Premier Khrushchev's visit to the United States in September, official spokesmen found it necessary to remind the Hungarian people that the meeting between Khrushchev and Eisenhower would not have "internal political effects" in Hungary, and that "the social order and internal system of the socialist countries are problems exclusively concerning the peoples of these countries."

The Central Committee of the Hungarian Communist Party announced on November 23 the ex-

Hungary's Premier Ferenc Münnich (left) and Communist Party leader János Kádár (right) greet Soviet Premier Khrushchev on the latter's visit to Budapest, June 4, 1959.

WIDE WORLD

pulsion of 11 party members for spreading revisionist ideas. Another 20 members retained membership in the party after admitting their mistakes, and a number of other members were accused of having cooperated with the "enemies of the working people" in 1956. The purges apparently were necessary in order to eliminate dissident elements prior to the first party congress held in Hungary since 1956.

The Seventh Communist Party Congress met at Budapest on Nov. 30–Dec. 5, 1959, and was attended by Premier Khrushchev. In an address at the opening session of the congress, János Kádár said that Soviet forces would remain in Hungary as long as the international situation required their presence, and that his government favored negotiations for the withdrawal of all foreign troops from Europe. (It is estimated that about 50,000–80,000 Soviet troops are stationed in Hungary.) Kádár also denounced the United States for allegedly trying to "undermine" the Hungarian regime, although he expressed a wish for "normal relations" with the United States. He praised the Soviet Union for its work toward peace, thanked that country for its help in crushing the 1956 revolt, and lauded Khrushchev for his successful trip to the United States. In his speech to the congress on December 1, Khrushchev warned that the Soviet Union had enough rockets to destroy all its foes, and insisted that the West Berlin issue must be settled. He blamed the Hungarian revolution of 1956 on "serious mistakes" committed by Mátyás Rákosi (former Hungarian leader), and admitted that his own denunciation of the "cult of personality" (Stalinism) in 1956 had started a "kind of fever" in all Communist countries.

The congress approved decisions to intensify the ideological campaign against class enemies and "revisionism," and to accelerate land collectivization and industrial expansion. A new Central Committee of 71 members was elected, replacing the existing committee of 53 members. Kádár was again elected first secretary; other secretaries are Jenö Fock, Gyula Kállay, Károly Kiss, and György Marosán, who with seven other party members[1] constitute the new 12-member Politburo. The congress adopted the Second Five-Year Plan (1961–65), which is the first Hungarian plan to be completely coordinated with the economic planning of the Soviet bloc's Council for Mutual Economic Assistance. Hungary is to receive 1 million kw.-hr. of electric power from the Soviet Union, 245,000 kw.-hr. from Czechoslovakia, and 250,000 kw.-hr. from East Germany. A pipeline (to be constructed) will bring oil to Hungary from the Volga basin in the USSR. Hungary is to supply the telecommunication equipment for these projects. The government has announced that all essential industrial raw materials needed for the Second Five-Year Plan will come from the Communist countries.

[1] Antal Apró, Béla Biszku, Lajos Fehér, Ferenc Münnich, Sándor Ronai, Miklós Somogyi, and Bezso Nemés.

In a report issued on November 27, Sir Leslie Munro, the United Nations special representative on the question of Hungary, charged that the Hungarian government had violated fundamental human rights and was still executing patriots involved in the 1956 revolution. He challenged the Hungarian authorities "to allow the true facts to be known" by permitting him to visit their country, and said that the withdrawal of Soviet forces from Hungary would contribute toward "normalization of the situation." The U.N. General Assembly approved on December 9 a new resolution urging the Soviet Union and Hungary to cooperate in honoring previous United Nations resolutions which had called on the USSR to withdraw from Hungary and had sought admission of a United Nations representative to survey the situation there. The decision by the United Nations to debate the Hungarian question had previously been condemned by János Kádár, who said it constituted a violation of the United Nations charter.

HYDROELECTRIC PROJECTS. See Index entry.

HYDROGEN BOMB. See Index entry.

HYGIENE. See INDUSTRIAL HEALTH AND SAFETY; PUBLIC HEALTH; SANITARY ENGINEERING.

ICE HOCKEY. See SPORTS, GAMES, AND SHOWS.

ICE SKATING. See SPORTS, GAMES, AND SHOWS.

ICELAND. An island republic in the North Atlantic, located close to the Arctic Circle. Estimated area, 39,770 square miles; pop. (Dec. 1, 1958), 170,156 (over 70% urban). Reykjavík (69,268) is the capital and chief city.

Government.—Iceland's Althing (parliament) consists of 60 members elected for 4 years by a system of mixed proportional and direct representation (see below, *Principal Events*). The Althing selects a third of its members to constitute an upper house, the remainder forming the lower house. Following the elections of Oct. 25–26, 1959, party seating in the Althing was: Independence (Conservatives), 24; Progressives, 17; Labor Alliance (Communists and allies), 10; and Social Democrats, 9. Premier Olafur Thors (Independence) heads an Independence–Social Democratic coalition cabinet formed on Nov. 20, 1959. Asgeir Asgeirsson was re-elected to a 4-year term as president of the republic in 1956.

Education and Religion.—Education is compulsory for children aged 7 to 15. Primary schools in 1954 numbered 135 (17,200 pupils); secondary, 64 (5,585). There were also several technical, teacher-training, and other special schools. The university in Reykjavík had 750 students. The Evangelical Lutheran Church is the national church, but there is complete religious freedom.

Finance.—Treasury cash transactions in 1958 (with 1957 data in parentheses) were: revenue, 954.7 million krónur (882.3 million); expenditure, 893.7 million (910.0 million). The par value of the króna is 16.3 krónur per U.S.$1. Following the issuance of a law on Jan. 30, 1959, for the simultaneous reduction of wages and prices, the cost-of-living index dropped about 5% from January to April, and remained stable for the rest of the year. In 1959 the U.S. International Cooperation Administration granted Iceland a loan of $1,760,000 (expected to be used to complete construction of a third power station on the Sog River), and a loan of $3 million to finance essential commodity imports.

Transportation and Communications.—Iceland has no

railroads. High roads approximate 5,123 miles. Keflavík Airport, 31 miles from Reykjavík, is a base for major international airlines. Passenger cars in 1958 numbered 12,939; telephones, 33,295; licensed radio sets, 45,000 (1957).

Production.—Iceland's fish catch, a mainstay of the economy, totaled 502,700 metric tons in 1957 (chiefly cod, herring, and ocean perch). Agriculture, which engages about a fifth of the population, consists mainly of livestock raising (sheep and cattle), and Iceland is nearly self-sufficient in dairy products, meat, and wool. Principal manufactures are foodstuffs, wearing apparel, footwear, furniture, and other light items. Electric power output totaled 427 million kw.-hr. (about 97% hydroelectric) in 1957, or more than twice that of 1951. National income in 1957 was estimated at 3,800 million krónur.

Foreign Trade.—Exports in 1958 totaled 1,069.1 million krónur (up 8% over 1957); imports, 1,399.9 million (up 3%). Fish and fish products constitute about 95% of exports. Imports are chiefly fuels and lubricants, cereals and other foodstuffs, fertilizers, wood, and iron and steel products. The Soviet Union, Iceland's chief trading partner, took 16% of 1958 exports and provided 17% of imports. Other important trading partners are the United States, Britain, and West Germany.

Principal Events, 1959.—A redivision of voting districts to take account of population shifts, and an increase in the membership of the Althing from 52 to 60 took place in 1959. Forty-nine seats are now filled by direct election, and 11 are apportioned among the parties to render seating proportionate to popular vote. Since constitutional amendments require passage by two separate Althings, two general elections were held during the year. In the elections of June 28, the Independence Party scored gains, while the Communists' popular vote dropped about a fourth. In the elections of October 25–26, however, the Independence Party, though retaining its lead, showed less strength than expected, while the Communists recouped their losses. Social Democratic Premier Emil Jónsson resigned on November 19, and Independence leader Olafur Thors formed a new Independence–Social Democratic coalition government on November 20.

Iceland's "fishing war" with Britain continued in 1959. Iceland registered diplomatic protests against British fishing operations within the 12-mile limit (unilaterally proclaimed by Iceland on Sept. 1, 1958), Icelandic patrol boats fired occasional warning shots near British trawlers, and in a few instances British skippers were fined and fishing gear confiscated. On April 27 the Icelandic government warned that Britain's refusal to accept the 12-mile limit was imperiling Iceland's support of the North Atlantic Treaty Organization (NATO).

On September 11, Iceland protested in Washington against the maltreatment of two Icelandic civil air officials who allegedly had been forced by a United States sentry to lie on wet ground at Keflavík Airport while he ascertained their right to pass. This and other minor incidents reflected popular resentment over the presence (mainly at Keflavík Airport) of some 5,000 U.S. servicemen as part of the NATO air defense system. Following the Icelandic protest, the commander of the United States forces was removed. A reduction in United States forces by about 1,200 men was planned in the first half of 1960.

M. J. G.

IDAHO. Northwestern state, United States; admitted to the Union, July 3, 1890. The "Gem of the Mountains State" ranks 13th in area and 42d in population among the 50 states.

Area and Population.—Area: 83,557 square miles (land, 82,769; inland water, 788), divided into 44 counties. Population: (1950) 588,637; (est., July 1, 1958) 652,000. Urban places with 1950 populations above 7,500 (unless another date is given): Boise, *the capital* (special census, 1957), 34,383; Caldwell, 10,487; Coeur d'Alene, 12,198; Franklin-Whitney-Airport, unincorporated, 7,809; Idaho Falls, 19,218; Lewiston, 12,985; Moscow, 10,593; Nampa, 16,185; Pocatello (special census, 1957), 27,140; and Twin Falls, 17,600.

Executive.—Chief state officers in 1959:
Governor: Robert E. Smylie (Republican)
Lieutenant Governor: W. E. Drevlow
Secretary of State: Arnold Williams
Treasurer: Rulon Swensen
Attorney General: Frank L. Benson
Auditor: Joe R. Williams
Supt. of Public Instruction: Delmar F. Engelking

Constitution and Judiciary.—The present constitution went into effect in 1890. The Supreme Court comprises five justices; chief justice in 1959 was James W. Porter.

Legislature.—The Idaho Legislature comprises a 44-member Senate (in 1959, 27 Democrats, 17 Republicans) and a 59-member House of Representatives (36 Democrats, 23 Republicans), which meet in odd-numbered years commencing the first Monday after January 1.

The 1959 session was distinguished both by accomplishment and failure. With an opportunity to effect important governmental reorganization it rejected proposals to consolidate agencies, reduce the number of elected state officials, and streamline the lawmaking process by creating a Legislative Interim Council. Nevertheless it worked hard for 64 days and passed over 300 bills, of which some dozen were vetoed and about 250 became law.

Among significant enactments were a revised income tax law which placed the Idaho income tax structure on the federal model, and a controversial $10 tax for all required to report income. These measures were calculated to support a General Fund appropriation of $75 million. Other important measures included an appropriation of $27 million (up $5 million from 1957–58) for the public schools, a strengthened traffic code giving special attention to juvenile drivers, reorganization of the justice courts (including abolition of the fee system for justices of the peace), and establishment of a run-off primary when no candidate for governor, U.S. senator, or congressman obtains 40% of the vote. The lawmakers also extended federal food and drug laws to intrastate traffic and submitted two constitutional amendments for popular vote in 1960: (1) to lower the voting age from 21 to 19; and (2) to raise the bonded debt limit from $2 million to 3% of the state's assessed valuation, thus increasing the limit to approximately $20 million on the basis of current assessments.

Finance.—In the 1958–59 fiscal year, revenue included $46,061,106.45 from state tax sources and $65,621,889.33 from the federal government. State tax revenue included $13,229,364 from individual income taxes, $4,298,422 from corporate income taxes, $13,484,451 from motor fuel taxes, and $12,769,159.84 from licensing. Expenditures of $182,403,525.93 consisted of $21,059,354.36 for education, $16,255,070.03 for health, welfare, and safety, $37,382,831.90 for highways, and $107,706,269.64 for other purposes. State long-term indebtedness on June 30, 1959, amounted to $1,620,000.

Banking.—As of June 10, 1959, the state's 10 national banks had $491,695,000 in assets, $278,955,000 in demand deposits, and $173,066,000 in time deposits. The 20 state banks had assets of $168,906,196.08, demand deposits of $101,021,456.52, and time deposits of $53,653,964.30.

Education.—School attendance is compulsory between the ages of 7 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $35,577,880.48 ($259.97 per pupil), and revenue of $50,305,543.71 included $22,523,864.39 from local school district taxes, $11,921,092.42 from the state, and $2,587,545.80 from the federal government. Capital outlays for new construction and improvements amounted to $14,979,925.95. Teachers' salaries (1958–59) averaged $4,281 (high school, $4,472.19; junior high, $4,254.89; elementary, $3,857.67).

In the 1959–60 school year there were 427 public elementary schools with 3,309 teachers and 92,443 pupils, and 195 secondary schools (including 67 junior high schools) with 2,787 teachers and 63,447 pupils. College and university enrollment in the 1958–59 school year totaled 10,829.

Social Welfare.—Public assistance expenditures in the 1958–59 fiscal year from state and federal funds (excluding institutional costs) totaled $10,238,231.72, including $4,047,234.36 for the aged, $1,796,841 for dependent children, and $3,786,901.16 for general relief. A monthly average of 10,742 persons received public assistance.

Labor Force.—In June 1959 the state's labor force totaled 272,200 persons, including 74,900 agricultural workers. Nonfarm employment stood at 186,600, compared with 185,200 a year earlier and an average of 179,700 for the intervening 12

months. Major employment sources were trade, 20.2%; government, 17.7%; and manufacturing, 15.6%. Unemployment of 10,700 on June 30, 1959, was down from 12,900 a year earlier.

Manufacturing.—There were 26,235 persons employed in manufacturing plants in 1957 who received $109,331,000 in wages. Value added by manufacture totaled $212,192,000, and outlays for new plant and equipment amounted to $19,144,000. Leading manufactures were the lumber and wood products industry, which added $76,356,000 in value by manufacture, employed 11,912 persons, and paid $51,979,000 in wages; foods and food processing ($54,412,000; 7,666; $26,119,000) and chemicals and products ($21,397,000; 966; $5,473,000). Production workers averaged $91.37 for an average workweek of 39.9 hours in August 1959.

The U.S. Atomic Energy Commission is a major employer in the state. Its Idaho operations in 1959 engaged 4,300 permanent employees and its payroll totaled up to $30 million.

Mining.—Idaho ranked 33d among the states in the value of its mineral output in 1958, with 0.39% of the national total. It produced most of the domestic output of antimony and was the principal producer of cobalt. The state also led in output of columbium-tantalum and lead, and continued first in silver (nearly 47% of United States output); was third in nickel, phosphate rock, recoverable zinc, and zirconium.

IDAHO MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Copper	9,846	$ 5,179,000
Gold (ounces)	15,896	556,000
Lead	53,603	12,543,000
Phosphate rock (long tons)	1,291,000	5,652,000
Sand and gravel	6,714,000	6,305,000
Silver (ounces)	15,953,000	14,438,000
Stone	1,122,000	1,710,000
Zinc	49,725	10,144,000
Other minerals	...	7,929,000
Total	...	$64,456,000

(Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1959 totaled $258,443,000, compared with $259,326,000 for the corresponding period of 1958. For the full year 1958, income comprised $190,818,000 from livestock and livestock products, $213,025,000 from crops, and $10,274,000 from government payments. Principal income sources in 1958 were: cattle, $96,141,000; wheat, $65,347,000; potatoes, $52,799,000; and dairy products, $50,399,000.

IDAHO CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	1,476	1,200	1,250
Barley (1,000 bu.)	14,696	19,775	16,916
Beans, dry (1,000 bags)	2,293	2,697	2,592
Cherries (tons)	3,392	4,310	2,300
Corn (1,000 bu.)	2,441	4,216	5,600
Hay (1,000 tons)	2,693	3,117	2,911
Hops (1,000 lb.)	2,755	5,670	6,790
Oats (1,000 bu.)	8,435	9,100	7,399
Peas, dry field (1,000 bags)	1,119	1,116	1,827
Potatoes (1,000 cwt.)	29,234*	43,838	40,222
Prunes (tons)	20,880	19,300	22,500
Sugar beets (1,000 short tons)	1,387	1,902	1,901
Wheat (1,000 bu.)	40,284	42,492	42,748

* Average, 1949–57. (Source: U.S. Department of Agriculture.)

The state had 39,000 farms in 1958. Their acreage (1954) of 14,364,000 included 3,728,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 1,414,000 cattle, 1,060,000 sheep, and 1,722,000 chickens (excluding commercial broilers). Some 76,000 family and hired workers were engaged in farming in the week of Oct. 18–24, 1959.

Transportation and Communications.—State and federal funds disbursed for highways in the 1958 calendar year totaled $30,820,200, and 922.6 miles of new construction were completed.

Highways and roads on Dec. 31, 1958, totaled 42,476 miles (23,536.2 surfaced). Registered *motor vehicles* numbered 370,814 on the same date, including 240,018 passenger cars. There were (1958) 9 *railroads* operating 3,094.44 line miles; and (1959) 4 regularly scheduled *airlines* and 164 *airports and airfields* (84 commercial and municipal, 1 military, 54 private, and 25 state).

Communications media (1959) included 30 AM *radio stations;* 5 VHF *television stations;* 14 daily *newspapers* (circulation, 141,192) and 75 other newspapers (98,100); and (January 1) 55,200 business and 153,400 residential *telephones.*

Principal Events, 1959.—Politics and fish stirred Idahoans in 1959. Democrats controlled the legislature and, except for the governorship, held all elective state offices. The governor controlled most appointments. Political partisanship flourished. Patronage-hungry Democrats blocked a reorganization program which would have reduced the number of elective officials to three: governor, lieutenant governor, and a proposed new office of comptroller, combining the offices of treasurer and auditor. The Democrats tried to transfer the tax collector and the Bureau of Accounts from the governor's control to that of the auditor, but they were blocked by a veto in the first and a court ruling in the second instance. They fired Park Superintendent J. W. Emmert and tried unsuccessfully to have State Forester Roger Guernsey removed from office. Attorney General Frank L. Benson, repeatedly in the news, failed to get the courts to block use of highway funds for a state office building or to declare the new income tax law invalid. He tried without success to establish the principle that all state agencies needing legal advice must use his office. Governor Smylie also showed partisanship, vetoing a law to designate "Democratic" as the official name for that party, and, on the death of State Treasurer Ruth Moon, hastily appointing Rulon Swenson to replace her in order to prevent a Democrat from getting the office while he toured the Soviet Union.

The new state tax program was unlikely to resolve the tax issue or to end the pressure for a sales tax. The income tax law, which created a furor when an error—later corrected by court order—was discovered in the bill signed by the governor, remained under attack by both Democrats and Republicans who feel that taxes could be cut by reverting to old rates. By adopting the federal income tax code and by imposing a $10 tax on all who file, the new program was expected to reach between 30,000 and 70,000 new taxpayers. It could also create a surplus of from $2 million to $5 million. This fact, the regressive nature of the "head tax," and the obvious political advantages of advocating or seeming to advocate tax cuts, would indicate a continuing fight between supporters of the new program, the old law, and a sales tax.

Idahoans, strong for the development of the lower Snake River, which would bring slack water, navigation, and industry above Lewiston, were in 1959 heatedly debating the merits of the Nez Perce and Mountain Sheep (middle Snake), Bruces Eddy and Penny Cliffs (North and Middle forks of the Clearwater) dam sites. Multimillion dollar facilities to pass a few thousand game fish up and down streams seemed extravagant to advocates of economic development However, in a state which, with a population of 650,000, sold 246,101 resident fish and game licenses in 1959, this matter was not an academic one, and it threat-

ened to delay development of power facilities in the area.

Among educational developments, the Idaho Education Association came out for a sales tax, and the University of Idaho started a Ph.D. program, opened an adult education center in Boise, and began a study of the human and material resources of the Fort Hall Indian Reservation.

Legislature and Principal Events by:

[1] Special census, 1958. [2] Special census, 1957.

Executive.—Chief state officers in 1959:
Governor: William G. Stratton (Republican)
Lieutenant Governor: John W. Chapman
Secretary of State: Charles F. Carpentier
Treasurer: Joseph D. Lohman
Attorney General: Grenville Beardsley
Auditor: Elbert S. Smith
Supt. of Public Instruction: George T. Wilkins

Constitution and Judiciary.—The present constitution went into effect in 1870. The Supreme Court comprises seven justices; chief justice in 1959 was Byron O. House.

Legislature.—The Illinois General Assembly comprises a 58-member Senate (in 1959, 34 Republicans, 24 Democrats) and a 177-member House of Representatives (92 Democrats, 85 Republicans), which meet in odd-numbered years commencing the first Wednesday after the first Monday in January. (See below, *Principal Events, 1959.*)

Finance.—In the 1957–58 fiscal year, state revenue of $946,598,972 consisted of $768,370,820 from state tax sources, $163,434,563 from the federal government, and $14,793,589 from other sources. Tax revenue comprised $316,203,000 from a 2½% general sales and use tax, $149,170,408 from motor fuel taxes, $114,586,000 from licensing, and $188,411,412 from other state tax sources. Expenditures of $899,232,010 consisted of $197,455,781 for education, $302,488,111 for health, welfare, and safety, $274,346,393 for highways, and $124,941,725 for other purposes. State long-term indebtedness on June 30, 1958, totaled $198,272,200.

Banking.—As of June 10, 1959, the state's 395 national banks had $12,522,330,000 in assets, $7,936,132,000 in demand deposits, and $3,120,301,000 in time deposits. The 553 state banks (Dec. 31, 1958) had assets of $5,372,686,904.78, demand deposits of $3,148,052,197.11, and time deposits of $1,827,951,259.14. There were also 460 savings and loan associations with assets of $2,556,704,890.68.

UPI

Dutch freighter *Prins Johan Willem Friso*, first ocean-going vessel to reach Chicago via the St. Lawrence Seaway, is welcomed by crowd at Lake Michigan pier, April 30, 1959.

Education.—School attendance is compulsory between the ages of 7 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $580,761,784.68 ($410.86 per pupil), comprising $447,186,574.21 from local school districts, $127,767,592.63 from the state, and $5,807,617.84 from the federal government. Outlays for construction and improvements amounted to $172,181,569.07, and teachers' salaries averaged $4,918.37 (high school, $5,305.58; elementary, $4,462.94).

In the 1957–58 school year there were 1,145 public elementary school districts with 43,967 teachers and 1,294,713 pupils, and 276 public secondary school districts with 19,022 teachers and 411,154 pupils. Higher educational institutions included 21 junior colleges with 27,777 students, 5 teachers colleges with 11,243 students, and 46 colleges and universities with 136,743 students.

Social Welfare.—In the 1958–59 fiscal year, public assistance expenditures from federal and state funds (excluding institutional costs) totaled $201,635,000, including $65,353,000 for the aged, $61,934,000 for dependent children, and $53,908,000 for general relief. A monthly average of 363,834 persons received public assistance. The state spent $66,457,068 for all mental health activities and $25,100,631.78 (1957–59 biennium) for its prison and penal programs.

Labor Force.—The state's labor force totaled 4,255,300 on May 15, 1959, including 230,000 agricultural workers. On June 15 there were 3,455,700 nonagricultural workers, compared with 3,328,400 a year earlier and an average of 3,316,000 for 1958. Of total nonfarm employees, 1,233,700 were active in manufacturing, 718,600 in trade, and 424,100 in service industries. Unemployment fell to 201,000 on May 15, 1959, from the previous May 15 total of 335,000. The state paid $217,349,260 in unemployment compensation claims during 1958.

Manufacturing.—In the first quarter of 1958 there were 14,641 manufacturing establishments covered by unemployment insurance which were employing 1,163,446 persons and paying $1,529,961,191 in wages. Estimated employment in all establishments (including those not covered by unemployment insurance) was 1,163,900. Value added by manufacture (1957) totaled $12,363,458,000, and outlays for new plant and equipment amounted to $923,428,000. Production workers averaged $96.81 for an average workweek of 40.6 hours in July 1959.

MAJOR ILLINOIS MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.* (thousands of dollars)
Nonelectrical machinery	227,067	$1,214,664	$2,199,375
Food and kindred products	130,311	629,010	1,585,671
Electrical machinery	160,032	747,916	1,334,232
Fabricated metal products	129,176	655,886	1,212,843

Transportation equipment	57,335	324,668	723,028
Instruments and related products	41,673	196,698	410,447
Stone, clay, glass products	35,456	175,215	392,082

* For definition, see text footnote 1 in the article *Industrial Production*. (Source: *Annual Survey of Manufactures: 1957*.)

Mining.—In 1958 Illinois stood seventh among the states in the value of its mineral output, with 3.52% of the United States total. The fuel group of minerals contributed 77% of the year's record total value. Illinois continued first in fluorspar output (48% of national total); second in perlite; third in stone; and fourth in bituminous coal and pig iron.

ILLINOIS MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Cement (bbl.)	9,618,000	$ 30,858,000
Clays	2,335,000	5,910,000
Coal	43,912,000	176,614,000
Coke	1,910,835	37,406,376[1]
Fluorspar	152,087	7,931,000
Iron, pig	4,217,898	258,661,000[1]
Lead[2]	1,610	377,000

Stone	35,016,000	44,245,000
Zinc[3]	24,940	5,088,000
Other minerals	...	32,157,000
Total	...	$582,412,000[4]

[1] Values for processed materials are not included in the total. [2] Recoverable content of ores. [3] Preliminary. [4] Total adjusted to eliminate duplication in the value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1959 dropped slightly to $1,464,370,000 from $1,500,090,000 for the corresponding period of 1958. For the full year 1958, income comprised $1,301,130,000 from livestock and livestock products, $782,649,000 from crops, and $41,342,000 from government payments. Principal income sources in 1958 were: cattle, $520,166,000; hogs, $501,152,000; corn, $319,714,000; and soybeans, $271,470,000.

ILLINOIS CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	2,672	2,140	2,300
Broomcorn (tons)	1,160	300	300
Corn (1,000 bu.)	509,193	587,673	673,350
Hay (1,000 tons)	4,558	4,709	4,508
Oats (1,000 bu.)	141,331	133,485	89,320
Peaches (1,000 bu.)	374	500	365

Soybeans (1,000 bu.)	96,964	141,848	125,610
Wheat (1,000 bu.)	44,246	53,361	42,330

(Source: U.S. Department of Agriculture.)

There were 168,000 farms in the state in 1958 with a total acreage of 30,500,000 (20,100,000 in harvested cropland). Livestock on farms (Jan. 1, 1959) included 4,061,000 cattle, 7,106,000 hogs, and 17,399,000 chickens (excluding commercial broilers). There were 254,000 persons engaged in agriculture between January and June 1959.

Transportation and Communications.—State and federal funds spent for highways in 1958 totaled $250,323,476, and 1,486.79 miles of new construction were completed.

Highways and roads on Dec. 31, 1958, totaled 102,247.77 miles, exclusive of 21,000 miles of municipal streets; in all, 92,669.3 miles were surfaced. Registered *motor vehicles* on the same date numbered 3,734,487, including 3,127,657 passenger cars. There were (1959) 57 *railroads* operating 11,412 line miles; 20 regularly scheduled *airlines;* and 660 *airports and airfields* (122 commercial and municipal, 3 military, and 535 private).

Communications media (1958) included 92 AM and 30 FM *radio stations;* 17 *television stations;* (1957) 94 daily *newspapers* (circulation, 3,829,219) and 667 other newspapers; and (Jan. 1, 1959) 1,274,100 business and 3,015,900 residential *telephones.*

Principal Events, 1959.—A hectic legislative session highlighted Illinois public affairs during the year. Starting with a sharp contest over the speakership and ending in much confusion, the session set many records. A contest for the speakership ended with Paul Powell (D., Vienna) being elected with the votes of the Republican minority. The dispute for the office grew out of a division in the Democratic Party between Chicago and downstate representatives.

More bills were introduced and passed than in any previous session, and the governor vetoed the largest number of bills in the state's history. On the next to last day, the House unseated one of its members, the first such action in recent years. The end of the session was marked by much confusion, and it was necessary on the last night to remain in session for 13 hours with the clock stopped in order for the legislature to complete its work.

To deal with financial problems, the legislature raised the state sales tax by a half cent to 3 cents per dollar. Counties were given the same power that cities already had to levy an additional half-cent sales tax in unincorporated areas. The legislature defeated a Democratic proposal to increase corporation taxes and an administration proposal to broaden the base of the sales tax. The tax on liquor was increased. A record budget was approved, but after the session the governor froze the funds for capital improvements, and many of the building projects at the state's institutions were held up.

The legislature enacted significant changes in the state's judiciary. The position of court administrator was created to speed up the flow of litigation, and the first appointee to the position was Henry P. Chandler, former administrator of federal courts. The number of justices of the peace in the state will be substantially reduced in 1961 and they will be put on a salary rather than fee basis. Other legislation provided for uniform daylight saving time from April to October, and a bonus for certain Korean War veterans.

For the first time since the adoption of the "Gateway" amendment in 1950, there will be no constitutional amendment on the ballot in 1960. There will be two bond issues on the ballot, however, providing funds for buildings at state educational and welfare institutions.

An unusually large number of foreign visitors came to Springfield and the Lincoln shrines during the year, including King Hussein of Jordan, President José María Lemus of El Salvador, and President Sean O'Kelly of Ireland. Mayor Willy Brandt of West Berlin, who spoke at a February 12 Lincoln sesquicentennial dinner, said that Lincoln's "house divided" speech contained "truths" which were "perhaps even more applicable to the present situation of the German people."

Although the steel strike had caused considerable unemployment, overall nonfarm employment was up 72,400 in September 1959 over the same month in 1958. Late in October the number of

those made jobless by the steel strike was 29,595.

Roger (The Terrible) Touhy, a well-known Chicago gangster of the prohibition era, was fatally shot by unknown assailants on December 16, three weeks after being freed on parole. He had served 25 years for a crime he said he did not commit. Touhy had been sentenced in 1934 to 99 years on a charge of having kidnaped John (Jake the Barber) Factor.

ILLITERACY. See Index entry.

IMMIGRATION AND NATURALIZATION. Immigration.—The number of persons who entered the United States during the year ended June 30, 1959, reached a new high of 157 million. This figure includes 84 million alien and 66 million citizen entries made across the Canadian and Mexican borders. The remainder were immigrants, crewmen, agricultural laborers, tourists, diplomats, students, other alien visitors, and United States citizens returning from abroad.

During the year, 260,686 immigrants were admitted to the United States for permanent residence, an increase of about 3% over the previous year's figure. This number includes 25,424 Hungarians who have been in the United States for two years or more and who gained adjustment of their status to that of permanent residents under the terms of an act of July 25, 1958. Also included are 24,834 persons admitted to the United States under the provisions of an act of Sept. 11, 1957, which is approximately the same number of persons admitted under this act during the previous year. Among the special groups covered by the act, 2,934 orphans and 1,471 highly skilled aliens, as well as 1,457 spouses and children of such aliens, gained admission to the United States. Also admitted under this law were 1,036 parents of United States citizens, 5,154 spouses and children of resident aliens, and 12,782 refugees. Quota immigrants in the fiscal year 1959 numbered 97,657, showing a 4% decrease from 1958. This decrease was mainly due to the smaller number of immigrants coming from the United Kingdom and Ireland. Other countries show less variation from the previous year's figure.

Within the national quotas, preferences are established for highly skilled aliens and for specified close relatives of United States citizens and resident aliens. The first preference portion allots 50% of the quota for highly skilled professional and technical persons whose services are urgently needed in the United States. A little over 3,500 persons were admitted in this category in the fiscal year 1959, showing an 11% decrease from 1958. Their spouses and children admitted under the same classification numbered over 3,000. In addition, 6,843 relatives of United States citizens were admitted in the second and fourth preference categories, and 7,543 spouses and children of resident aliens entered under the third preference classification.

Nonquota immigrants are not restricted numerically, but they must meet the standards of health, morals, literacy, and economics established for all immigrants. In 1959, 163,029 persons were admitted as nonquota immigrants, an increase of almost 12,000 compared with 1958. Again in 1959, the largest nonquota class admitted consisted of 66,386 natives of the independent countries of the Western Hemisphere. This is a decrease of approximately 23% as compared with the previous year's figure, and was caused by a considerable decline in the number of immigrants from Canada, Mexico, and Cuba.

Spouses and children of United States citizens, totaling 36,402, were the second largest group of nonquota immigrants. The greatest number of wives came from Germany (5,399) and Japan (4,412), while the largest number of nonquota husbands were natives of Italy (1,734).

The 25,424 Hungarians mentioned previously were included in 1959 in the nonquota group under the act of July 25, 1958, as were the 24,834 admitted under the act of Sept. 11, 1957.

Table 1 shows, by principal countries of birth, the number of quota and nonquota immigrants admitted.

Table 1—IMMIGRANT ALIENS ADMITTED TO THE UNITED STATES IN THE YEAR ENDED JUNE 30, 1959

Country or region of birth	Total admitted	Quota immigrants	Nonquota immigrants
All countries	260,686	97,657	163,029
Europe	158,023	89,145	68,878
Austria	2,355	1,474	881
Czechoslovakia	2,813	2,219	594
France	4,487	2,784	1,703
Germany	31,422	23,997	7,425
Greece	4,507	435	4,072
Ireland	7,371	7,291	80
Italy	16,251	5,871	10,380
Netherlands	4,005	2,903	1,102
Norway	2,484	2,248	236
Poland	8,301	5,894	2,407
Sweden	2,079	2,020	59
United Kingdom	20,954	20,279	675
Yugoslavia	4,349	1,146	3,203
Other Europe	46,645	10,584	36,061
North America	64,740	1,527	63,213
Canada	23,082	9	23,073
Mexico	23,061	1	23,060
West Indies	12,218	1,212	11,006
Central America	5,808	102	5,706
Other North America	571	203	368
South America	9,792	160	9,632
Asia	24,312	4,941	19,371
Africa	2,631	1,115	1,516
Australia and New Zealand	870	503	367
Other countries	318	266	52

(Source: U.S. Department of Justice, Immigration and Naturalization Service.)

Admissions of nonimmigrants (aliens admitted for temporary periods) totaled more than one million in the 1959 fiscal year, an increase of 21% over the previous year's figure. This includes approximately 600,000 tourists, more than 35,000 students, and some 24,000 exchange visitors.

In addition to the above, approximately 450,000 Mexican agricultural laborers were admitted. Also, 1,692,893 alien crewmen serving on vessels and planes arriving in the United States were inspected and granted permission to land.

Apprehension and Expulsion of Aliens.—The number of deportable aliens who were located and found to be illegally in the United States declined further to 64,819 in the fiscal year 1959. This decline is due chiefly to the decrease in the number of Mexicans who entered the United States surreptitiously. In 1959, 7,988 aliens were formally deported from the United States, an increase of about 10% over the previous year's figure. Violation of nonimmigrant status and illegal entry were the main grounds for deportation; 56,610 aliens were required to depart without formal proceedings.

Naturalizations.—During the year ended June 30, 1959, 103,931 persons were granted United States citizenship through naturalization. Of these, 72% were from Europe (chiefly Germany, the United Kingdom, Italy, and Poland), 10% were

from Canada, and 5% were from Mexico. Besides the 77,000 persons naturalized under the general provisions of the law, there were 19,000 spouses and almost 6,000 children of United States citizens naturalized under the special provisions applicable to these classes. A third of the children were formerly German, and another 6% were Japanese.

Table 2 shows the principal countries of former allegiance of all those naturalized during the years ended June 30, 1955–59.

Table 2—PRINCIPAL COUNTRIES OF FORMER ALLEGIANCE OF PERSONS NATURALIZED IN THE UNITED STATES
(Years Ended June 30, 1955 to 1959)

Country of former allegiance	1959	1958	1957	1956	1955
All countries	103,931	119,866	138,043	145,885	209,526
British Empire	10,990	12,428	13,210	13,600	22,974

Poland	7,603	11,038	16,582	17,256	27,777
USSR	3,205	4,582	6,993	7,771	8,627
Yugoslavia	2,121	4,154	4,647	4,681	3,689
Other	20,756	22,645	26,840	30,378	44,140

(Source: U.S. Department of Justice, Immigration and Naturalization Service.)

Certificates of derivative citizenship were issued to 25,162 persons during the fiscal year 1959, including 6,907 cases where citizenship was acquired by birth to citizen parents abroad. Petitions for naturalization were denied in 2,208 cases, generally because the petitioner withdrew or failed to prosecute the petition.

JOSEPH M. SWING,
Commissioner of Immigration and Naturalization, U.S. Department of Justice.

IMPORTS. See INTERNATIONAL TRADE and the *Foreign Trade* section of articles on countries.

INCOME. National Income and Product.[1]—National economic activity in the United States was markedly higher in 1959 than in the previous year. As shown in Table 1, gross national product for the first three quarters of 1959 was at a record annual rate (seasonally adjusted) of $478 billion, 8% above the 1958 total of $442 billion. (The annual rate data represent the average of estimates for the first three quarters which have been adjusted for seasonal influences and multiplied by four to facilitate comparison with previous annual totals.) The bulk of the rise in gross national product from 1958 to 1959 represented an expansion in the physical volume of production; the general average of prices increased relatively little over the period.

National income in the first half of 1959 amounted at an annual rate to $397 billion, as compared with $366 billion in 1958. (See Table 2.) Although complete information for the third quarter was not available in 1959, it was evident that the annual rate of national income for the first nine months of the year would also show an increase of about 8% over the full year 1958.

In the first three quarters of 1959, personal income was at an annual rate of $378 billion, and disposable income—personal income less personal taxes—amounted to about $333 billion. (See Table 3.) Both of these comprehensive measures of the flow of income to individuals averaged 5% higher than in 1958.

Table 1—GROSS NATIONAL PRODUCT OR EXPENDITURE, 1956–59
(Billions of dollars)[1]

Item	1956	1957	1958	1959[2]
Gross national product	419.2	442.5	441.7	477.8
Personal consumption expenditures	269.9	284.8	293.0	309.5

Patterns of Economic Change.—The expansion of income and production in 1959 reflected recovery of the economy from the business recession which extended from the fall of 1957 to the spring of 1958. However, the economic scene in the latter part of 1959 was dominated by the prolonged steel strike, which served to offset in part the gains achieved through midyear.

Table 2—NATIONAL INCOME BY DISTRIBUTIVE SHARES, 1956–59
(Billions of dollars)[1]

Item	1956	1957	1958	1959[2]
National income	350.8	366.5	366.2	396.7

[1] Detail will not necessarily add to totals because of rounding.
[2] Data cover first two quarters and represent averages of seasonally adjusted quarterly totals expressed at annual rates. (Source: U.S. Department of Commerce.)

From the third quarter of 1957 to the first quarter of 1958, gross national product declined 4% in value and 5% in physical volume—the difference between these percentages reflecting the further edging up of prices during the period of

[1] *National income* is the sum of the net earnings of labor and property which arise from the current production of goods and services by the nation's economy. It measures, therefore, the total factor cost of the goods and services produced by the economy. Earnings are measured in the forms in which they accrue to residents of the nation, before deduction of taxes on those earnings.

Personal income is the current income received by persons from all sources, including transfers from government and business but excluding transfers among persons. It differs from national income by the inclusion of transfers (such as relief, veterans' pensions, and unemployment compensation) which are not in return for current productive services, and by the exclusion of earnings (social insurance contributions and undistributed corporate income) which are not actually received by persons in the current period.

Gross national product or expenditure measures the market value of the output of goods and services produced by the nation's economy, before deduction of depreciation charges and other allowances for durable capital goods used up in the productive process. Other business products used by business in the accounting period are excluded.

business downturn. The economy made its turnabout in the second quarter of 1958 and expanded rapidly thereafter. In the second quarter of 1959, gross national product attained a record annual rate of $484.5 billion—about $54 billion, or 12%, above the first-quarter 1958 recession low. With prices showing only moderate rises, a very large proportion of the increase represented growth in the physical volume of goods and services.

The following generalizations emerge from a comparison of changes in overall production and prices during the 1957–59 cycle in business with those recorded for corresponding periods of the two earlier postwar swings in economic activity:

(1) Based on the movement of gross national product in real terms (adjusted for changes in price), the 1957–58 recession was the sharpest of the postwar period. It was also the shortest, since the first substantial stride in recovery came after three quarters (two of decline and one of leveling out), as against four quarters in the 1948–49 recession and five quarters in the 1953–54 downturn.

(2) More broadly, all three recessions may be characterized as relatively mild, with the declines serving to check only briefly the underlying forward motion of the national economy.

(3) The first five quarters of business recovery brought roughly equal expansions of total national output in the three postwar cycles.

(4) Real gross national product was not so much above its prerecession peak in the second quarter of 1959 as it had been at comparable points of the earlier recoveries. This distinguishing feature was directly attributable to the somewhat greater severity of the latest downturn, but it did not reflect any relative lack of strength in the recovery which got under way in the spring of 1958.

(5) The phenomenon of rising prices during a recession was not unique to the 1957–58 period. Taken together, the movements of prices in the three postwar business cycles were symptomatic of an almost total absence of downward pressure on

Table 3—PERSONAL INCOME AND DISPOSITION OF INCOME, 1956–59

(Billions of dollars)[1]

Item	1956	1957	1958	1959[2]
Personal income	332.9	350.6	359.0	378.0
Wage and salary disbursements	227.6	238.5	239.4	256.6
Other labor income	8.1	9.1	9.3	9.9
Proprietors' and rental income	54.6	56.0	58.4	58.2
Dividends	12.1	12.5	12.4	13.1
Personal interest income	17.5	19.5	20.4	22.0
Transfer payments	18.8	21.7	26.1	26.5
Less: Personal contributions for social insurance	5.8	6.7	7.0	8.3
Less: Personal tax and nontax payments	40.0	42.7	42.6	45.4
Federal	35.2	37.4	36.7	39.1
State and local	4.8	5.4	5.8	6.3
Equals: Disposable personal income	292.9	307.9	316.5	332.6
Less: Personal consumption expenditures	269.9	284.8	293.0	309.5
Equals: Personal saving	23.0	23.1	23.5	23.2

[1] Detail will not necessarily add to totals because of rounding. [2] Data cover first three quarters and represent averages of seasonally adjusted quarterly totals expressed at annual rates. (Source: U.S. Department of Commerce.)

the United States price level during the postwar period.

The upward movement of the economy at the middle of 1959 was checked by the work stoppage in steel, which lasted 116 days until the half-million workers out on strike returned to the mills in November under a Taft-Hartley Act injunction upheld by the Supreme Court. (See also IRON AND STEEL; LABOR.) In the third quarter of 1959, gross national product declined to an annual rate of $478.5 billion—about $6 billion below the peak attained in the previous three months.

Gross National Product.—The 1959 data on gross national product revealed marked changes in distribution of national output among its major markets. These changes did not constitute a fundamental alteration in the pattern of gross national product but represented primarily a reaction from the 1957–58 recessionary developments.

Most noteworthy was the strong expansion in investment demand, which had been sharply affected by the recession. Residential construction rose substantially; business inventories were again accumulated in 1959 following a liquidation during the period of recession; and producers' durable equipment also advanced, although remaining well below the 1957 level. Nonresidential construction changed little in the aggregate from 1958 to 1959.

Table 4—PERSONAL INCOME BY STATES AND REGIONS, 1957 AND 1958[1]

State and region	Total personal income (millions of dollars) 1957	1958	Per capita amount 1958	Per cent of national per capita income 1958

The estimates of "state personal income" shown in this table differ in definition in one respect from the personal income data in Table 3. This pertains to the exclusion from the state estimates of income disbursed by the federal government to its civilian and military personnel stationed outside the continental United States. (Source: U.S. Department of Commerce.)

The United States business recovery through mid-1959 was generated primarily by the shift

from inventory liquidation to accumulation, the increase in residential building, and greater government purchases. Fundamental support came from the continuing steady advance of consumer spending. This mainly reflected, and contributed to, a rising trend in personal income.

In the third quarter of 1959, business inventories constituted by far the largest element of change in gross national product. Stocks were liquidated at a rate of $1 billion, following an accumulation at the very high annual rate of $10.5 billion in the previous quarter. Developments in steel were mainly responsible for this substantial shift. After building up steel supplies in the spring months as a hedge against the possibility of the strike which actually occurred, the principal steel-consuming industries drew heavily on these supplies in the third quarter to maintain deliveries, thereby offsetting the further increase of inventories elsewhere in the economy.

Termed "final purchases," total gross national product, except for the change in business inventories, advanced from an annual rate of $474 billion in the second quarter of 1959 to $480 billion in the third. While affected to some extent by the steel strike, basic market demands in the third quarter thus continued strong and expansionary.

National Income.—Among the major industrial divisions of the economy, the main impact of the recession was on manufacturing, particularly durable goods industries. Besides manufacturing, the fluctuations in economic activity during 1957–59 had a noticeable effect on transportation, mining, and certain other lines. On the other hand, the recession served barely to check the pace of continuing upward trends in such industrial divisions as communications, public utilities, services, and finance and insurance.

As is shown in Table 2, the principal changes from 1957 to 1959 in the distributive shares of national income were registered by corporate profits. Wages and salaries in private industry also reflected the impact of the recession, but the decline and ensuing recovery were much less marked than in the typically volatile profits item.

Personal Income by States.—The dollar flow of income to individuals was at a record high in nearly every state in 1958, the latest year for which official estimates were available in 1959.

Personal income in the continental United States as a whole was up 2% in 1958 over 1957. Rates of increase were largest in the Great Plains, Southeast, Southwest, Rocky Mountain, and Far West regions. (See Table 4.) Income expansion was comparatively limited in New England and the Mideast, while the Great Lakes states experienced an actual small decline. It was in these three industrialized regions that the slump in manufacturing activity during the 1957–58 recession had its principal impact, and in which the generally sharp expansion of farm income contributed least to overall income.

INCOME TAX. See TAXATION.

INDIA, Portuguese. See PORTUGUESE TERRITORIES.

INDIA, Republic of. Seventh largest country in the world (area, including Sikkim, 1,269,835 square miles), India extends southward for 2,000 miles from the Himalaya in a tapering peninsula that is flanked on the west by the Arabian Sea and on the east by the Bay of Bengal. The population, which increases by more than 5 million annually, was estimated on July 1, 1958, at 397,540,000, being exceeded only by that of Communist China.

Formerly an imperial realm of Great Britain, India became a sovereign democratic republic under a constitution inaugurated on Jan. 26, 1950, with full membership (from April 27, 1949) and dominion status in the Commonwealth of Nations. Under the States Reorganization Act (effective Nov. 1, 1956), it consists of 14 states, 7 centrally administered territories, and the protected state of Sikkim. Included in the aggregate population and area is the disputed state of Jammu and Kashmir (see KASHMIR). Components of India, with areas and populations as issued by the Indian registrar general in December 1957, based on 1951 census figures adjusted to the reorganization of states in 1956, are as follows:

REPUBLIC OF INDIA

Component	Area (sq. mi.)	Population (1951)[1]	Capital
States			
Andhra Pradesh	105,963	31,260,133	Hyderabad
Assam[2]	85,012	9,043,707[3]	Shillong
Bihar	67,164	38,783,778	Patna
Bombay[4]	190,919	48,265,221	Bombay
Jammu and Kashmir[5]	92,780	4,410,000[6]	Srinagar
Kerala	15,035	13,549,118	Trivandrum
Madhya Pradesh	171,201	26,071,637	Bhopal
Madras	50,110	29,974,936	Madras
Mysore	74,326	19,401,193	Bangalore
Orissa	60,136	14,645,946	Bhubaneswar
Punjab	47,456	16,134,890	Chandigarh
Rajasthan	132,077	15,970,774	Jaipur
Uttar Pradesh	113,409	63,215,742	Lucknow
West Bengal	33,945	26,302,386	Calcutta
Territories			
Andaman and Nicobar Islands	3,215	30,971	Port Blair
Delhi	578	1,744,072	Delhi

Protected State			
Sikkim	2,744	137,725	Gangtok
Total	1,269,835	361,606,647	

[1] Census populations adjusted to political divisions as reorganized in 1956. [2] Includes North-East Frontier Agency and Naga Hills–Tuensang Area, which are administered by the president of the republic acting through the governor of Assam. The latter, formed on Dec. 1, 1957, comprises 6,236 square miles and has a population of about 369,000 people of the Naga groups, living in 718 villages. Numerous raids by Naga tribal rebels occurred in 1959. [3] Excludes population of Part B tribal areas (est. 561,000), where census was not taken. [4] Includes Gujarat and Maharashtra. [5] Status in dispute with Pakistan. [6] Estimate; census not taken in the state. [7] Includes Pondicherry, Karikal, Yanaon, and Mahé, formally ceded by France in 1956.

Although the population dependent on agriculture numbered 249 million at the 1951 census, the share of urban dwellers in the total population had increased from 13.9% in 1941 to 17.3% in 1951. In that year, 26.5% of the rural population lived in villages of fewer than 500 persons; 38% of the urban population, in the 73 cities with populations exceeding 100,000.

The capital, New Delhi, had a population of 276,314 in 1951. Major seaports, with 1951 populations, are Calcutta (2,548,677; in 1955, 3,344,938), Bombay (2,839,270), and Madras (1,416,056). Other large cities are Hyderabad (1,085,722), Old Delhi (914,790), Ahmadabad (788,333), Bangalore (778,977), Kanpur (705,383), Lucknow (496,861), Poona (480,982), Nagpur (449,099), and Howrah (433,630).

The People.—Partition of the subcontinent in 1947 reduced the Moslem population of India to 35,400,117 (1951 census). In 1951, Hindus numbered 303,186,986; Christians, 8,157,765; Sikhs, 6,219,134; Jains, 1,618,406; Buddhists, 180,767; Parsis, 111,791; and Jews, 26,781.

The Indian birth rate (crude rate, est. 39.9 per 1,000 in 1958; registered rate, 23.9) is one of the highest in the world, the death rate (crude rate, est. 27.4 per 1,000 in 1958; registered rate, 11.9) is similarly high, and the proportion of people who live beyond middle age is very low. India accordingly has a large juvenile population (38.3% of the total), or only slightly less than that of the countries of Africa (39.1%). The average population density is 313 persons per square mile. In February 1959 the Indian government decided to provide surgical facilities (at first for males only) in state-owned hospitals as a means of controlling population growth. As yet only the governments of Madras and Kerala have officially adopted the sterilization of men.

Government.—Under the Indian Constitution, the executive consists of a president (Dr. Rajendra Prasad, re-elected on May 10, 1957, for a second 5-year term by an electoral college consisting of the elected members of both houses of Parliament

and of the legislative assemblies of the states) and a vice president (Dr. Sarvepalli Radhakrishnan, re-elected for a second 5-year term on April 23, 1957). A 13-member Council of Ministers is headed by Prime Minister Jawaharlal Nehru, leader of the Congress Party. In addition, there are 14 ministers of state and 12 deputy ministers.

Parliament comprises a Council of States (Rajya Sabha) of 232 members, of whom 12 are nominated by the president and 220 elected by state legislative assemblies; and a House of the People (Lok Sabha), consisting of a maximum of 500 members directly elected in the states on the basis of adult suffrage and of not more than 20 members chosen to represent the Union territories. Each of the states has its own popularly elected legislature.

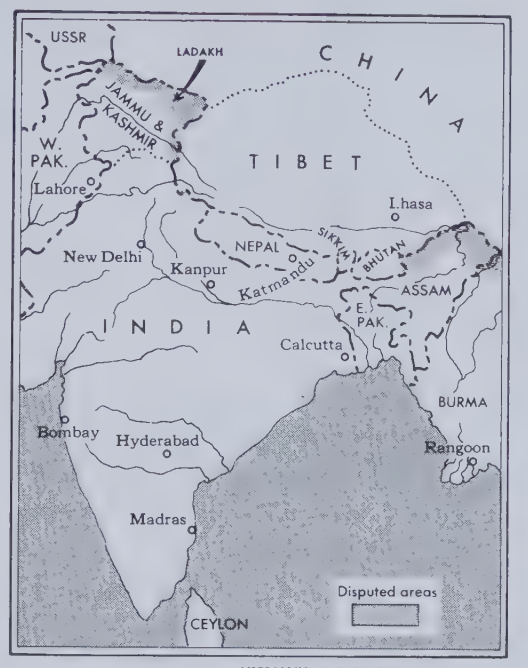
When the Indian states and territories were reorganized, largely on linguistic lines, in 1956, Bombay remained bilingual. Two main groups, the Marathi-speaking people, numbering 29,500,000, of the central and southern regions, and 18,500,000 Gujaratis in the north, pressed for a division of the state between them, but the future status of the city of Bombay caused a deadlock. Finally, on Dec. 4, 1959, a 9-member study group recommended partition of the state into two new states, Gujarat and Maharashtra, with the city falling within the boundaries of the latter. It was expected that the Congress Party would secure legislation to put the recommendation into effect in 1960.

On Feb. 2, 1959, Mrs. Indira Gandhi, daughter of Prime Minister Nehru, was elected to the presidency of the Indian National Congress, an office held by both her father and her grandfather. On December 3, Neelam Sanjeeva Reddy, chief minister of Andhra Pradesh, was chosen to succeed her in 1960.

Finance.—The 1959–60 budget provided for a deficit of Rs.583 million (1 rupee = U.S.$0.21) on the revenue account. Total revenue was estimated at Rs.9,314 million, including income tax, Rs.1,663 million; excise duties, Rs.3,251 million; and customs, Rs.1,328 million. The principal categories of expenditure were building development and social service, Rs.2,529 million; defense, Rs.2,427 million; and debt and administrative services, Rs.1,124 million. The budget was also debited with Rs.1,646 million of revenue transferred to the states. Capital outlay by the central government was estimated at Rs.4,775 million, and loans and advances at Rs.3,868 million. The net permanent debt was Rs.3,979 million.

United States economic assistance to India, which began in 1951, totaled $1,792.7 million by Aug. 31, 1959. In November 1959, agreements were reached covering sales of United States agricultural commodities valued at $257.3 million. Assistance from Great Britain included credits of £28.5 million (December 1958) and £19 million (November 1959) and a loan of £13 million (June 1959) for an oil pipeline in Assam and Bihar. (For Soviet assistance, see below, *The Year 1959 in India.*)

Education.—Education in general is the responsibility of the state governments; the Union government determines standards for higher education and administers 4 universities: Aligarh, Varanasi (Banaras), Delhi, and Visva Bharati. It was announced in September 1959 that literacy had increased to 40.7% of the population, as compared with 16.6% in 1951. Under plans formulated for compulsory and free education for all children up to 14 years of age, basic education schools, of which there were 47,813, with 5,060,807 pupils, in 1955–56, are to replace primary schools (278,765, with 22,965,562 pupils, in 1955–56). At basic schools academic learning is correlated with such activities as spinning, weaving, and domestic crafts. Similarly, secondary schools (32,568, with 8,526,509 students, in 1955–56) are being converted into multipurpose institutions, offering instruction in languages, social studies, science, and crafts. In 1955–56, India had 32 universities, 712 arts and science colleges, 34 research institutions, 346 professional colleges, and 112 special education colleges. The Second Five-Year Plan called for the establishment of 6 more universities by 1960–61



AMERICANA MAP BY DONALD T. PITCHER

INDIA'S DISPUTED BORDER AREAS

A major international trouble spot developed in 1959 when Communist Chinese troops attacked Indian outposts in the region of disputed border areas (shaded portions on map) between the two countries. In the North-East Frontier Agency, China claims large areas of Indian territory below the McMahon Line, established in 1914 as India's border with Tibet and China. In the west, the Chinese have built a highway through the Ladakh section of Kashmir, connecting Gartok, Tibet, with the Sinkiang Province of China.

(the 37th, Vikram University, Ujjain, was opened in 1957).

Defense.—India's armed forces consist mainly of a small regular army, a National Volunteer

"SOMETHING MUST HAVE GONE WRONG"

PLETCHER IN THE SIOUX CITY JOURNAL

Force with a training program involving 500,000 men, a National Cadet Corps (at strength in 1958 of 4,500 officers and 160,000 cadets), and an Auxiliary Cadet Corps (780,000 in 1958). Regular personnel in the air force number 26,400, and there are about 450 operational aircraft.

In connection with his announcement (Aug. 28, 1959) of attacks by Communist Chinese forces (see below, *The Year 1959 in India*), Prime Minister Nehru stated that all of the North-East Frontier Agency had been placed under army control, with the chief of staff, Lt. Gen. K. S. Thimayya, in command. Operational headquarters were set up in Jorhat, Assam, and the Assam Rifles, a civilian force under the state government, was incorporated with regular elements. Other frontiers were reinforced, with defense in the Ladakh section of Kashmir being planned by senior army and air force officers in consultation with local commanders. Estimates put the number of Chinese troops deployed on the Tibetan border at 40,000.

Second Five-Year Plan (1956–61).—Of the Rs.10,943 million earmarked for industrial expansion under the plan, 45.9% was to be spent by 1960–61 on metallurgical industries, 13.7% on heavy and light engineering, and 12% on the chemical industry. Expansion of facilities to produce heavy chemicals, including nitrogenous fertilizers, and of the iron and steel industry were given priority in 1959. The first blast furnaces were opened at the Rourkela steel plant, built with West German assistance, on February 3, and at the Bhilai plant, erected with Soviet aid, on February 4. With the Durgapur mill's first blast furnace opened on December 29 with British assistance, the new plants were scheduled to add over 3 million tons to India's steelmaking capacity.

Agriculture.—Official estimates of the 1958–59 rice crop were a record 43.7 million tons of paddy and 29.7 million tons of grain. Food prospects were further improved by the success of kharif pulses, of which 1,542,000 tons were produced. Production of wheat rose from 290 million bushels in 1958 to 362 million in 1959, and that of corn from 120 million to 126 million bushels. Overall food grain production in the crop year 1958–59, at 73.5 million tons, fell short of national requirements by 6.7 million tons, however, and 3,173,000 tons of grain, valued at Rs.1,205 million, had to be imported.

India produces almost half the world's supply of tea, the 1958–59 crop amounting to 701,600,000 pounds. In 1958–59 centrifugal sugar production declined to 2,642,000 short tons; tobacco production rose from 530,640,000 pounds in 1958 to 588,880,000 pounds in 1959. In 1959, 4 million bales of cotton and 2,040 million pounds of jute were produced.

Mineral Production.—In 1958, India produced 6,132,000 metric tons of iron ore. Bauxite deposits are widespread, and in 1958 output of primary aluminum totaled 9,109 short tons. Coal reserves are estimated at 50 billion tons; in 1958 production reached 45,350,000 metric tons, to which the private sector contributed 39,550,000 tons. Production of refined copper amounted to 7,967 metric tons in 1958; that of refined lead, to 3,360 metric tons. According to the Indian Atomic Energy Commission, the country has established uranium reserves of 30,000 tons.

Industrial Production.—While the industrial production index (1953 = 100) rose from 130 in 1957 to only 132 in 1958, it averaged 139 in the first 6 months of 1959. Besides the products of heavy industry, including 2,148,000 metric tons of pig iron and ferroalloys and 1,848,000 tons of crude steel in 1958, India turns out a wide variety of consumer goods. In 1958–59 these included 1,689 million pounds of cotton yarn, 4,915 million yards of mill cloth, 1,111,700 motor vehicles, 28,620 tractors, 260,875 tons of paper, 30,671 million cigarettes, and 805,200 tons of wheat flour. The output of cement in the calendar year 1958 totaled 6,168,000 metric tons. In 1958–59, 12,597 million kw.-hr. of electricity were generated, as compared with 10,869 million kw.-hr. in 1957–58. The International Bank for Reconstruction and Development (IBRD) made a $25 million loan for the Koyna hydroelectric project in Bombay State on April 8, 1959.

External Trade.—Strict licensing control accounted for a decline in imports from the high level of Rs.10,683 million in 1957 to Rs.8,642 million in 1958. As a result, India's trade deficit was reduced from Rs.4,118 million to Rs.2,862 million. Total earnings from exports also decreased, from Rs.6,565 million in 1957 to Rs.5,780 million in 1958, but exports of tea rose from Rs.1,243 million to Rs.1,368 million. In 1958 imports from the United States amounted to Rs.1,615 million; exports to the United States, to Rs.932 million. Total imports were valued at Rs.4,157 million in the first half of 1959; total exports, at Rs.2,687 million.

Transportation and Communications.—In 1958–59 gross traffic receipts on the government railways were estimated at Rs.4,075 million, working expenses at Rs.3,306 million, and passengers at 1,382.5 million. The system, which is the largest in Asia after that of the USSR, totals 34,744 route miles. On July 15, 1959, the IBRD extended a $50 million loan for its expansion and modernization. National highways, aggregating 13,800 miles, connect state capitals; about 126,000 miles of surfaced and 205,000 miles of unsurfaced roads are maintained at public expense. A 6,074-foot, double-decker road and rail bridge across the Ganges, named Rajendra Bridge for the president, was opened at Mokameh on May 1, 1959. The only bridge across the river in Bihar, it was expected to improve communications both within that state and with Nepal and other buffer states. Indian aircraft flew 23.4 million miles on scheduled services in 1957, carrying 593,700 passengers and 98 million pounds of cargo and mail.

In 1958, India had 6,472 telephone exchanges, 334,773 telephones, and 1,540,495 radio licenses. The first television station was opened in New Delhi on Sept. 18, 1959.

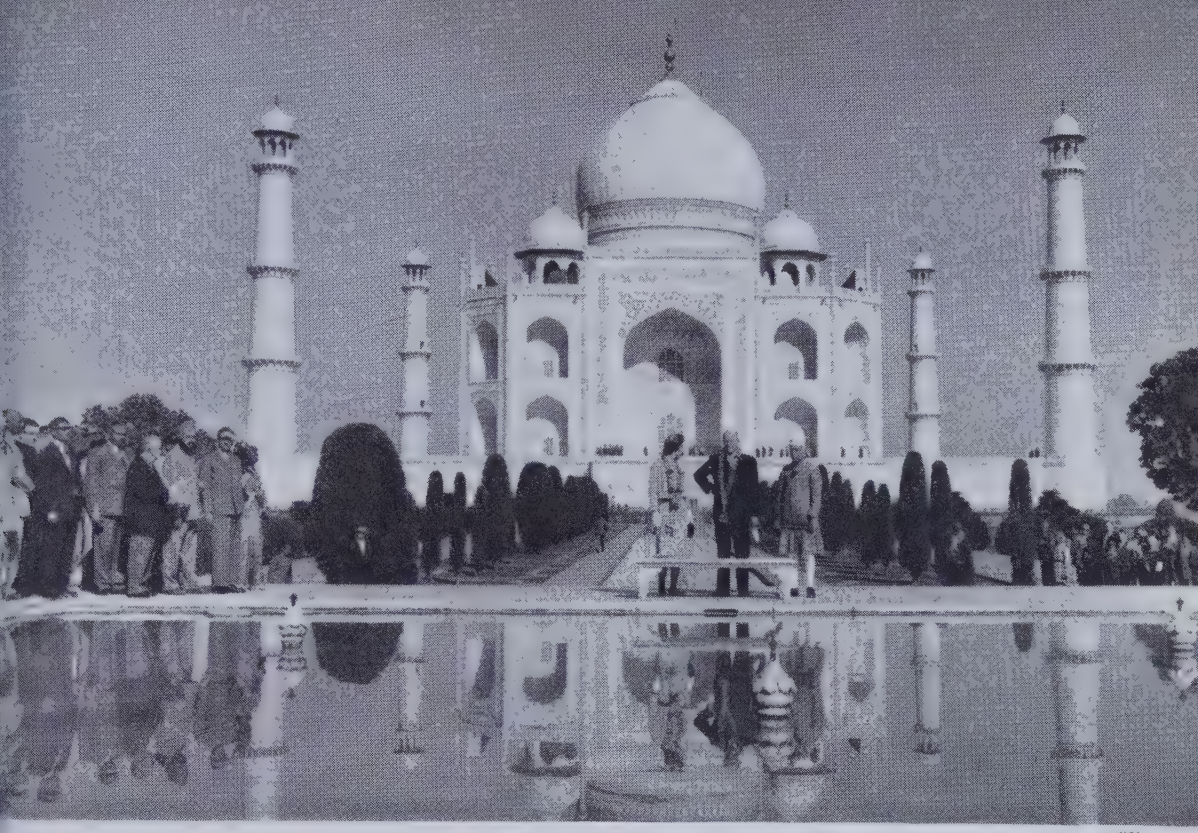
Dalai Lama (right), who fled from Tibet in March, is met at Mussoorie, India, on April 24 by Prime Minister Nehru.

WIDE WORLD

THE YEAR 1959 IN INDIA

Overshadowing events within India during the year was the developing quarrel with Communist China. The friendship which had marked relations between the two countries was interrupted by the



UPI

Standing before the Taj Mahal, the 17th-century mausoleum near Agra, India, President Eisenhower (center), with his daughter-in-law Barbara and Prime Minister Nehru, pays his respects on December 13 to one of India's famous architectural wonders.

harsh repression of a Tibetan revolt against Chinese control, first among the unsubdued Khamba tribe in eastern Tibet and then in the capital itself, when Tibetans perceived a threat to the safety of the Dalai Lama. Accompanied by an entourage of 80, the Dalai Lama left Lhasa on March 17 and reached the border of the North-East Frontier Agency near Towang on March 31. On April 3, India announced that he and his party had been granted asylum, and on April 21 he was escorted to Mussoorie, Uttar Pradesh, where he now resides.

Meanwhile, on March 28, the official New China News Agency charged that the Indian town of Kalimpong had served as the "commanding center" of the rebellion. Mounting pressure for a public denunciation of Chinese suppression of the revolt seized upon this reflection on India's carefully preserved neutrality. On March 30, Prime Minister Nehru, after denying India's complicity, expressed his country's fundamental dilemma when he spoke of India's real desire on the one hand to see the people of Tibet "progress in freedom" and on the other to maintain friendly relations with "the great country of China." He counseled "a certain measure of restraint." The Chinese propaganda barrage continued, however, and on April 1 there was an acrimonious debate in the Indian Parliament, spurred by the publication by the Chinese embassy in New Delhi of an article originally printed in the Peking *Jenmin Jihpao* describing Kalimpong as a "center of collusion with imperialism" and by a statement released by the Indian Communist Party supporting this charge. In an exchange of notes, Communist China stated that the Dalai Lama had left Tibet under duress and charged India with interference and imperialist expansion, a charge India vigorously protested. On April 18, the Dalai Lama denied that he had left Tibet under duress. Although he failed to obtain Indian sponsorship, he referred the Tibetan dispute to the United Nations on September 9. (See also TIBET.)

The Tibetan matter had hardly settled down when Prime Minister Nehru announced in Parliament on August 28 that large detachments of Communist Chinese troops had entered the Subansiri and Kameng frontier divisions of the North-East Frontier Agency. In the ensuing debate it was revealed that the Chinese had completed a road from Sinkiang through the Ladakh section of Kashmir in 1958 and had established a camp at Spanggur, taking actual control of 3,000 square miles of Ladakh territory. Altogether, the territorial dispute involved about 48,000 square miles along the 2,500-mile border.[1] The Chinese showed little inclination to soften the dispute despite Soviet urging of a peaceful settlement. Armed clashes continued, including a Chinese ambush on October 21 well within Ladakh, in which nine members of an Indian patrol were killed and seven were captured.[2] Spokesmen for outraged public opinion demanded a stronger stand, and Nehru assured the country that the army was prepared to defend its borders, in which he specifically included (November 27) the northern border of Nepal. Meanwhile, between September 8 and December 26, India and China exchanged a series of notes on the territorial dispute. A Chinese note of November 7 suggested a conference between Nehru and Premier Chou En-

[1] A 1914 treaty established the McMahon Line at the crest of the Himalaya along the northeastern frontier of India, but it was endorsed only by the then British government of India and Tibetan authorities, and maps published in China included within its territory various areas on the Indian side of the line. The eastern border of Ladakh has never been formally delineated, although a *de facto* partition line has stood for several decades.

[2] With three Indians captured earlier, the seven men were returned on November 14.

lai and a mutual withdrawal to about 12.5 miles from the frontier along the McMahon Line and from the line of actual control in Ladakh, thus surrendering control of 3,000 square miles of that section to China. India countered on November 14 with a proposal to create a no-man's land, with China withdrawing to its side of the border in both areas, while India would draw back to its side of the boundary line claimed by Peking. Personal diplomacy was considered premature, and a Chinese proposal for a meeting on December 26 was rejected. In the face of mounting criticism, directed particularly at the unpopular minister of defense, V. K. Krishna Menon, who was accused of softness toward China, Nehru won parliamentary endorsement of his policies on November 27. (See also CHINA.)

India's border troubles were not limited to the Chinese frontier. Firing across the Pakistan border, which had been halted after the agreement of Sept. 11, 1958, between Nehru and Malik Firoz Khan Noon, was resumed in a series of skirmishes on the Assam–East Pakistan border between November 1958 and July 1959. On April 10, 1959, an Indian bomber was shot down 40 miles south of Rawalpindi in West Pakistan. On the brighter side, a one-year agreement on the distribution of the canal waters in the Punjab was reached in Washington on April 17, and successful trade discussions were held in New Delhi on July 22–27. In meetings at New Delhi on October 15–23, delegations of the two countries reached agreement on several questions concerning the borders between India and East Pakistan.

President Dwight D. Eisenhower (q.v.), who visited India on December 9–14 during his 11-nation tour, was received enthusiastically in New Delhi.

Internally, India's major concern in 1959 was the formulation of the Third Five-Year Plan (1961–66). Despite criticism that the previous plan was overly ambitious, it appeared unlikely that the scope of the new plan would be curtailed. For one thing, it was anticipated that 21 million new jobs were needed to eradicate current unemployment of 7 million men and to take care of the 14 million expected to enter the labor force by 1966. At best, only 12 million new jobs were scheduled to be created during the five-year period. To maximize employment possibilities and to help reduce the agricultural labor force, the plan was to emphasize the development of heavy industry. On July 30, the USSR announced an unrestricted loan of Rs.1,800 million for the implementation of the plan, bringing total Soviet assistance to date to Rs.3,130 million.

At its 64th annual meeting, held at Nagpur on January 6–11, the Indian National Congress adopted a resolution proposing sweeping changes in the organization of agriculture. The resolution called for the adoption by the states of ceilings on landholdings and for the establishment of cooperatives. Land would be pooled for joint cultivation, while individual farmers would retain their property rights and receive a share of the net produce in proportion to their holdings. Those actually working on the land would also receive a share according to the labor they expended. Land in excess of the ceilings would be vested in village panchayats (councils) and worked as cooperatives by landless farm laborers. Partly as a protest against the resolution, N. G. Ranga resigned as general secretary of the Congress Parliamentary Party, and on June 4 he emerged as a leader, along with Chakravarti Rajagopalachari, Minoo R. Masani, and M. A. Venkata Rao, of a new conservative bloc called the Swatantra (Freedom) Party. The party was formally launched in Bombay on August 1–2.

Throughout the country, the Congress Party was undergoing severe strain. The Congress ministry in Orissa, defeated in the Legislative Assembly on February 23, regained its position only by forming a coalition with the conservative Ganatantra Parishad on May 22. In Andhra Pradesh a new Democratic Party split off from the Congress on February 13 and, together with the Praja Socialist Party, crossed over to the opposition in the Legislative Assembly. Only by drawing back into its ranks 20 members elected as independents was the Congress able to maintain its majority. In Calcutta the army had to be called out on September 3 to restore order in the wake of violent demonstrations against the food policy of the Bengal government.

The most serious trouble arose in Kerala, where unrest consequent on agitation against the Communist-led government brought (July 31) a proclamation by President Prasad which, under Article 356 of the Indian Constitution, dismissed the state Assembly, placed all power in the president's hands, and called for new elections. Lined up in opposition to the Communists were the state Congress Party, the Praja Socialist Party, and the Muslim League; the Nair Service Society, representing a wealthy landlord caste in Kerala; and various church groups, notably the Roman Catholic Church, which has the largest membership among Christians in the state.

The immediate spark for the agitation was the signing by the president on February 20 of a modified education bill that empowered the state government to take over government-aided schools and to provide a list of approved teachers from which all schools must employ their staff. In the background was an Agrarian Relations bill which received its third reading in the Assembly on June 10. This bill included provisions that reduced the holdings and power of the wealthy landlords and scaled down the debt owed by the peasants. During May many private schools threatened not to open as scheduled on June 1. A fortnight's delay in the opening date was announced by the government, but a civil disobedience movement and the picketing of government offices were initiated on June 12, and mass demonstrations led to police firings on demonstrators. A hartal (complete stoppage of all public life) was called on the same day, and a general strike on June 29.

The agitation, which initially had been disapproved of by the national Congress Party, eventually led to the dismissal of the state government. Many Indians regretted the Congress Party move, fearing that a dangerous precedent had been set. They felt that if it were not for the Communist onus in the Sino-Indian quarrel, the Kerala Communists might win another election. E. M. S. Namboodiripad, Communist chief minister of the state, carefully dissociated himself from the Indian Communist Party's official support of the Chinese version of events.

INDIANA. North Central state, United States; admitted to the Union, Dec. 11, 1816. The "Hoosier State" ranks 38th in area and 10th in population among the 50 states.

Area and Population.—Area: 36,291 square miles (land, 36,205; inland water, 86), divided into 92 counties. Population: (1950) 3,934,224; (est., July 1, 1958) 4,565,000. Urban places with populations above 10,000 (as estimated by the State Board of Health for 1958, unless otherwise indicated) are:

Anderson	50,700	Lafayette	40,500
Bedford	12,700	La Porte	23,100
Bloomington	30,100	Logansport	21,100
Columbus	21,700	Marion	35,344[2]
Connersville	17,800	Michigan City	33,100
Crawfordsville	13,900	Mishawaka	34,089[2]
East Chicago	59,700	Muncie	65,100
Elkhart	38,300	New Albany	38,600
Elwood	11,961[1]	New Castle	20,867[1]
Evansville	136,200	Peru	15,100
Fort Wayne	153,200	Richmond	38,900
Frankfort	15,600	Seymour	11,683[3]
Gary	177,500	Shelbyville	13,800
Goshen	12,600	South Bend	131,770[2]
Hammond	108,305[2]	Terre Haute	73,700
Highland	12,305[2]	Valparaiso	15,100
Hobart	16,800	Vincennes	18,800
Huntington	16,200	Wabash	12,000
Indianapolis (*capital*)	461,654[2]	Washington	11,400
Jeffersonville	19,900	West Lafayette	12,600
Kokomo	45,700		

[1] Special census, 1958. [2] Special census, 1957. [3] Special census, 1955.

Executive.—Chief state officers in 1959:
Governor: Harold W. Handley (Republican)
Lieutenant Governor: Crawford F. Parker
Secretary of State: John R. Walsh
Treasurer: Jack A. Haymaker
Attorney General: Edwin K. Steers
Auditor: Albert A. Steinwedel
Supt. of Public Instruction: William E. Wilson

Constitution and Judiciary.—The present constitution went into effect in 1851. The Supreme Court comprises five justices; chief justice in 1959 was Harold E. Achor.

Legislature.—The Indiana General Assembly comprises a 50-member Senate (in 1959, 27 Republicans, 23 Democrats) and a 100-member House of Representatives (79 Democrats, 21 Republicans), which meet in odd-numbered years commencing the first Thursday after the first Monday in January.

The 1959 General Assembly enacted its first billion-dollar budget, of which some $1,020,000,000 was for general state operations and $40 million for construction or improvement of state properties, including $17.2 million for educational institutions. More equitable valuation was enacted for real and personal property taxation. In the field of education, $205.5 million was allocated for public schools and $95.3 million for higher education; teachers' minimum salaries were raised; school corporations were authorized to conduct instruction through commercial television facilities; counties were required to plan reorganization of school units; and a State Commission for the Reorganization of School Corporations was created.

State participation in an interstate compact for traffic safety was authorized; traffic violators with a 30-day or shorter sentence were permitted to serve their sentences on weekends; and restricted drivers' licenses were authorized where suspension of licenses would cause hardship for dependents. Local authorities were authorized to finance community psychiatric clinics, and a Governor's Youth Council was created.

Other legislation set up a $2 million flood-control fund and a committee to survey water rights and management; passed a boating safety act; established the Wabash Valley Compact with Illinois; and adopted the Interstate Compact on Mental Health.

Unemployment compensation benefits were increased to $36 weekly and the benefits period extended to 26 weeks; workmen's compensation benefits were raised to $39 weekly; and larger payments were authorized for specific injuries. Women in manufacturing were permitted to work from 10 P.M. to 6 A.M.

Two proposed amendments would require judges of circuit courts to have been duly admitted to practice law by the state Supreme Court and would simplify technical legislative requirements in the General Assembly's enactment of laws.

Finance.—In the 1958–59 fiscal year, state revenue of $480,987,043 comprised $378,990,920 from state tax sources, $87,484,479 from the federal government, and $14,511,644 from other sources. Tax revenue consisted of $175,175,895 from gross income taxes, $95,761,241 from motor fuel taxes, $6,422,245 from licensing, and $101,631,539 from other sources. Expenditures of $465,613,085 comprised $157,900,554 for education, $82,595,381 for health, welfare, and safety, $170,174,588 for highways, and $54,942,562 for other purposes.

Banking.—As of June 10, 1959, the state's 123 national banks had $2,777,578,000 in assets, $1,731,628,000 in demand deposits, and $783,852,000 in time deposits. The 336 state banks (June 30, 1959) had assets of $2,120,667,640, demand deposits of $1,264,791,382, and time deposits of $679,302,667. There were also (Dec. 31, 1958) 228 savings and loan associations with assets of $1,480,950,236.

Education.—School attendance is compulsory between the ages of 7 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1958–59 school year totaled $265 million ($312 per pupil), comprising $166,950,000 from local school districts, $95,400,000 from the state, and $2,650,000 from the federal government. Outlays for construction and improvements amounted to $83,173,708.72, and teachers' salaries averaged $4,800.

INDIANA SCHOOL STATISTICS, 1958–59

Type of school	No.	Teachers	Students
Public elementary (1–8)	1,600	22,012	681,210
Public junior high (7–8)	75	...*	...*
Public senior high (9–12)	690	10,647	231,181
Private and parochial elementary and secondary	500	...	125,000
Vocational and trade schools	5	900	24,000
Colleges and universities	33	...	85,852

* Included in senior high data.

Social Welfare.—In the 1958–59 fiscal year, public assistance expenditures from federal and state funds (excluding institutional costs) totaled $36,525,194.95, including $21,241,874.35 for the aged, $13,558,573.79 for dependent children, and $1,724,746.81 for the needy blind. A monthly average of 61,834 persons received public assistance. State expenditures for mental health activities totaled $26,956,948; for correctional and penal programs (1957–58), $6,685,448.

Labor Force.—The labor force in June 1959 totaled 1,812,700 persons, of whom 322,500 were agricultural workers. Nonfarm employment was 1,408,800, above both the figure of 1,325,500 a year earlier and the average of 1,347,200 for the intervening 12 months. Of employed nonagricultural workers, 43% were engaged in manufacturing, 19% in trade, and 13% in government services. Unemployment in June 1959 totaled 80,700, less than half that of 165,700 a year earlier.

Manufacturing.—Major industrial developments of 1959 included the breaking of ground near Gary in August for a major new steel-finishing mill for the National Steel Corporation and announcement in November that the Youngstown Sheet and Tube Company would launch a $60 million expansion of its East Chicago facilities.

The preceding year the state's 6,940 manufacturing plants employed an average of 546,500 persons who received $2,610,566,000 in wages. Value added by manufacture totaled $4,929,951,000, and outlays for new plant and equipment amounted to $631,748,000. Production workers averaged $96.94 for an average workweek of 40.9 hours in August 1959.

MAJOR INDIANA MANUFACTURES, 1958

Type of industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.* (thousands of dollars)
Primary metals	88,200	$475,914	$964,503
Blast furnaces	57,700	311,340	630,973
Transportation equipment	81,100	422,667	709,531
Motor vehicles & equipment	48,100	275,745	442,372
Electrical machinery	75,300	342,555	616,439
Communications equipment	33,300	151,488	272,632
Food and kindred products	47,700	194,835	420,490
Chemicals & related products	22,700	128,777	396,658
Nonelectrical machinery	47,500	237,641	395,026
Fabricated metals	36,900	182,954	299,712

* Value of products less cost of materials, supplies, fuel, electric energy, and contract work. (Source: Indiana Department of Commerce.)

Mining.—In 1958 Indiana ranked 20th among the states in the value of its mineral output, with 1.20% of the national total. Fuels accounted for 47% and nonfuels for 53% of the total income. The state was second in coke production and fifth in pig iron output. Construction of a new aluminum plant at Evansville proceeded, although at a reduced rate, toward completion in 1960. The U.S. Bureau of Mines reported that the opening

of the St. Lawrence Seaway in 1959 stimulated interest in possible industrial, particularly steel, sites along the Indiana shore of Lake Michigan.

INDIANA MINERAL PRODUCTION, 1958

(In short tons except as noted)

Mineral	Quantity	Value
Clays	1,371,000	$ 2,477,000
Coal	15,022,000	58,506,000
Coke	7,797,352	157,112,578[1]
Iron, pig	7,757,011	453,049,000[1]
Natural gas (1,000 cubic feet)[2]	378,000	59,000
Peat	12,106	145,000
Petroleum (bbl.)[2]	11,864,000	35,711,000
Sand and gravel	16,862,000	15,045,000
Stone	15,394,000	31,974,000
Other minerals	...	56,407,000
Total	...	$197,677,000[3]

[1] Values for processed materials are not included in the total. [2] Preliminary. [3] Total adjusted to eliminate duplicating the value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1959 dropped to $749,721,000 from $797,823,000 for the corresponding period of 1958. For the full year 1958, income comprised $748,054,000 from livestock and livestock products, $341,498,000 from crops, and $38,018,000 from government payments. Principal income sources in 1958 were: hogs, $291,207,000; cattle, $202,615,000; dairy products, $126,099,000; and soybeans, $115,882,000.

INDIANA CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	1,428	1,628	1,525
Corn (1,000 bu.)	252,458	280,161	336,350
Hay (1,000 tons)	2,648	2,355	2,224
Oats (1,000 bu.)	49,614	48,093	32,175
Popcorn (1,000 lb.)	52,098	97,500	61,600
Potatoes (1,000 cwt.)	1,871*	1,352	1,890
Soybeans (1,000 bu.)	41,400	61,263	60,112
Strawberries (1,000 lb.)	4,241*	5,250	3,240
Tobacco (1,000 lb.)	13,352	10,570	11,040
Wheat (1,000 bu.)	35,830	40,992	32,630

* Average, 1949–57. (Source: U.S. Department of Agriculture.)

There were 150,000 farms in the state in 1958. Total farm acreage (1954) of 19,233,000 included 11,333,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 2,107,000 cattle, 4,848,000 hogs, and 13,718,000 chickens (excluding commercial broilers). Family and hired workers numbered 205,000 during the week of Nov. 22–29, 1959.

Transportation and Communications.—State and federal funds disbursed for highways in the 1958–59 fiscal year totaled $109,448,153.72, and 349.3 miles of new construction were completed.

Highways and roads on Sept. 30, 1959, totaled 87,913 miles (32,035 surfaced). Registered *motor vehicles* numbered 2,093,057 during 1958, including 1,568,713 passenger cars. There were (1959) 32 *railroads* operating 6,675.85 track miles; 9 regularly scheduled *airlines;* and 148 *airports and airfields* (106 commercial and municipal, 2 military, and 40 private).

Communications media (1959) included 60 AM and 16 FM (13 combined with AM) *radio stations;* 6 VHF and 7 UHF *television stations;* (1958) 87 daily *newspapers* (circulation, 1,695,194) and 257 other newspapers (1,410,727); and (Jan. 1, 1959) 399,300 business and 1,273,600 residential *telephones.*

Principal Events, 1959.—Since Indiana is one of the major steel-producing states and because many of its industries are users of steel, the steel strike (July 15–November 7) had a pronounced adverse effect on the economy of the state. The following table of selected indexes for five comparable months of 1958 and 1959 gives an indication of the effects of the strike. The trends indicated for 1958 were steady, as in employment, or rising, as in the other categories. The opposite was generally the case in the comparable period of 1959. The figures, compiled by the Indiana University Bureau of Business Research, use a 1947–49 base of 100.

Category	Five months of 1958 June	July	Aug.	Sept.	Oct.
Bank debits	174.2	197.2	181.5	184.2	208.3
Department store sales	107.7	118.4	119.4	120.9	124.9
Electricity production	224.6	233.9	235.5	237.6	241.7
Manufacturing employment	100.6	99.9	99.5	99.5	99.9
Steel output	111.0	111.1	117.6	124.2	130.4

Category	Five months of 1959 June	July	Aug.	Sept.	Oct.
Bank debits	220.0	223.5	230.2	215.0	196.4
Department store sales	143.3	136.7	126.1	132.2	131.0*
Electricity production	273.9	263.7	261.7	245.4	251.6
Manufacturing employment	113.8	111.0	100.4	101.3	103.1
Steel output	160.2	65.7	8.9	9.0	8.2

* Estimate.

The quadrennial municipal elections in Indiana occurred on November 3. Four years earlier the Democrats had more than doubled the number of cities under their control by winning 72 out of 104. It was rather freely predicted in 1959 that they would not be able to hold these gains and that at least a fourth of the cities under Democratic control would revert to the Republicans. During the four years intervening between elections three towns had become cities, thus making a total of 107. Of this total, 71 elected Democratic mayors in November 1959. The party therefore suffered a net loss of one mayoralty but for the first time in a quarter of a century won in all major cities. Only one city (Kokomo) in the state's top 20 went to the Republicans. Election results for boards of trustees in the state's 441 towns continued not to reveal any significant political trends, one reason being that many town races are between various "citizen" or "independent" groups rather than between Democrats and Republicans.

In one small city the race for mayor resulted in a tie. The state election board decided that the incumbent mayor, a Republican and candidate for re-election, would continue in office on the ground that a mayor serves "until a successor has been elected and qualified." To students of government this seemed a strange way of disposing of the matter. Generally in the state, election ties are decided by lot.

Principal Events by: P. S. Sikes,
Dean, The Junior Division, Indiana University.

INDIANS, American. The Department of the Interior's Bureau of Indian Affairs continued in the fiscal year ending June 30, 1959, to provide American Indians with better and broader educational and economic opportunities. The Indian population of the United States in 1950 was 455,500, of whom 66,900 were in Arizona, 54,000 in Oklahoma, and 43,500 in New Mexico.

The Department of the Interior's position in regard to the termination of federal trust responsibilities for Indian tribal groups was clarified by Secretary Fred A. Seaton, in a radio address at Flagstaff, Ariz., on Sept. 18, 1958. He declared that it was not the department's intention to "abandon Indian groups regardless of their ability to fend for themselves," and that termination of the government's responsibility for a tribe could not occur until the educational level of the tribe was "equal to the responsibilities which it was shouldering." The secretary also said that an Indian tribal group should end its relationship with the government only when the Indians themselves approved of termination.

Terminal Legislation.—New Indian terminal legislation enacted by Congress in fiscal 1959 covered 41 small Indian groups in California who had asked for such legislation, and provided for a

referendum on each termination plan or property distribution scheme before it went into effect. By June 30, 1959, 23 of the groups had submitted plans which were tentatively approved by the Department of the Interior.

Congress also enacted a major amendment to the terminal law of 1954 affecting the Klamath tribe in Oregon. The act was concerned with the sale of tribal property to compensate the withdrawing members of the tribe, and it allocated $90 million to purchase the Klamath marshlands for a national wildlife refuge and the unsold forest areas for inclusion in the national forest system. Of 11 forest units designated for private purchase, four were offered for sale in April 1959. An area of about 145,000 acres was preserved for the remaining tribal members and was transferred to a private trustee in March 1959.

Education.—In fiscal 1959, enrollment of Indian children aged 6-18 in all schools increased 2% to a record 132,000. Instructional programs in the bureau's schools were adjusted to meet the needs of new Indian pupils. The bureau expanded its adult education classes on the reservations to 80 locations, five more than in fiscal 1958. Grant funds were used to help 500 Indian students enter institutions of higher learning.

Vocational Training.—Since fiscal 1958, when the bureau's new vocational training program began operation, the number of Indians receiving such training has increased from 376 to 1,547. In fiscal 1959, new plants for on-the-job training and employment of Indians were established near the Umatilla Reservation in Oregon and the Cherokee Reservation in North Carolina.

Economic Developments.—Income to Indians from the leasing of their lands for oil and gas development totaled $46,587,458 in fiscal 1959—the third highest figure ever reported, but a major decline from the top total of about $72 million in 1957. Increased production on Indian (especially Navajo) lands resulted in record oil and gas royalties valued at $30,172,382, or 63% above similar income in fiscal 1958. Receipts from sales of timber on Indian lands totaled about $10,937,485 in fiscal 1959—an increase of 17% over that of the previous year.

M. M. Tozier,
Information Officer, Bureau of Indian Affairs.

INDOCHINA. See Cambodia; Laos; Vietnam.

INDONESIA. The Republic of Indonesia is a nation consisting of some 2,000 inhabited islands, lying astride the equator between the Indian and Pacific oceans. The republic's total land area of approximately 583,000 square miles—exclusive of Netherlands New Guinea (q.v.), or West Irian, which is disputed between Indonesia and the Netherlands—is largely accounted for by four large islands: Kalimantan or Borneo (208,000 square miles, not including the British Borneo territories); Sumatra (164,000 square miles); Sulawesi or Celebes (73,000 square miles); and Java (51,000 square miles).

Population.—With a population estimated to total about 88 million at the end of 1958, Indonesia is the sixth most heavily populated country in the world. The approximate distribution of its population is as follows: Java and Madura (56.7 million); Sumatra (14.3 million); Sulawesi (6.4 million); Kalimantan (3.8 million); and other islands (6.8 million). Java is one of the most densely inhabited areas of the world, having an average of about 1,100 persons per square mile.

The major urban centers and their approximate population as of the end of 1956 were: Djakarta, the capital, 2,800,000; Surabaja, 980,900; Bandung, 870,300; Djogjakarta, 500,000; Malang, 420,000; Semarang, 390,000; and Surakarta, 350,000. All of these cities are in Java. Other cities of importance are: Medan, in Sumatra (520,000); and Makasar, in Sulawesi (346,100).

WIDE WORLD

Indonesian President Sukarno (l.) shakes hands with Prime Minister Djuanda Kartawidjaja, July 6, after Sukarno reinstated the constitution of 1945 and the cabinet resigned.

The vast majority of the Indonesian people spring from a common Malayan stock. Among the more important ethnic groups on the island of Java are the Javanese, Sundanese, and Madurese; on Sumatra, the Minangkabau, Batak, and Atjehnese; in Borneo, the Dayaks; in Celebes, the Buginese and Menadonese; and in the Moluccas Islands, the Ambonese. The principal ethnic groups not of Malayan stock are the Chinese (about 2.5 million), Arabs (70,000), and Indians and Pakistanis (30,000). A wide variety of regional and local languages are spoken throughout the nation, but the official and national language is Indonesian, a dialect of Malay. English is a compulsory subject in the secondary schools.

Government.—Indonesia's independence from its former Dutch rulers was proclaimed on Aug. 17, 1945, and, following protracted hostilities and negotiations, was confirmed by a formal transfer of sovereignty from the Netherlands to Indonesia on Dec. 27, 1949. Indonesia is now operating under its third constitution since the transfer of sovereignty. Under a decree promulgated by President Sukarno on July 5, 1959, a provisional constitution which served as the republic's basic document from 1945 to 1949 was re-enacted into law as a permanent constitution. Like the United States Constitution, it provides for a strong president, a cabinet responsible directly to him, a Parliament, and an independent judiciary headed by a Supreme Court.

Power to amend the constitution and the responsibility to set down the broad lines of national policy are entrusted to a People's Consultative Assembly which, though not yet in being, is to consist of Parliament, plus an unstated number of regional and other representatives. A Provisional Supreme Advisory Council, consisting of representatives of the provinces, of political parties, and of "functional groups" (such as labor, peasants, and intellectuals) was appointed on July 30, 1959, by President Sukarno. Its function is to advise the president and the government on national policy matters. A National Planning Council was appointed by the president on the same date, to provide blueprints for governmental action in the political, economic, and social fields.

Under the newly re-enacted constitution of 1945, Parliament has undergone some reduction in influence, since it no longer possesses the power to overturn cabinets. The Parliament, installed in 1956, consists of 273 elected and appointed members. Four major parties dominate it: the Indonesian Nationalist Party (57 seats), the Moslem Masjumi (57 seats), the Moslem Scholars or Nahdlatul Ulama (45 seats), and the Indonesian Communist Party (39 seats).

President Sukarno is the chief of state and, since July 1959, the prime minister as well, although Djuanda Kartawidjaja is the functioning head of the cabinet, serving as "first minister." In the event the president is unable to act or is absent from the country, the chairman of Parliament acts as president.

Education.—It was officially estimated that in 1955 some 55% of the population over 13 years of age was illiterate. During the 1955 school year official statistics show that 5,911,957 pupils were enrolled in 30,031 public and private schools. Over 637,000 students were enrolled in secondary schools, while 20,395 students attended colleges and universities. At the end of 1958 there were 38 university-level institutions.

Religion.—The great majority of the population is of the Moslem faith, although Islam is not practiced with equal fervor in all parts of the country. Official estimates show that at the end of 1956 there were 3.5 million Protestants and about 1 million Roman Catholics in the country. About 1 million Indonesians practice a modified form of Hinduism on the islands of Bali and Lombok, and there are relatively smaller, but still considerable numbers of Buddhists, especially among the Chinese. In the islands

outside of Java and, to a limited extent, in Java itself, a large number of people practice a form of animism.

Finance.—The official unit of currency is the rupiah. It was devalued on Aug. 25, 1959, and its present par value is officially 45 rupiah to U.S.$1. (The official basic rate had been 11.4 rupiah to $U.S.1, but a certificate rate of 37.8 rupiah to $U.S.1 had governed virtually all transactions.) Although some improvement in financial conditions took place in the early part of 1959, as compared with 1958, deterioration set in again in the summer and fall. Internal price levels rose steadily during the first half of 1959, and, in an effort to maintain control of the situation, the government devalued the currency, aiming at increasing exports and discouraging imports, in order to conserve its limited holdings of foreign exchange. The devaluation measure was accompanied by regulations freezing 90% of the value of bank accounts over 25,000 rupiah and reducing notes in the 500- and 1,000-rupiah denominations to one tenth their face value. These regulations had the effect of virtually wiping out the working capital of many private firms, and restrictions on the extension of bank credit contributed to make the position of these companies a difficult one.

The budget for the calendar year 1959 estimated total expenditures at 28.9 billion rupiah against receipts of 20.9 billion, for a record deficit of 8.0 billion rupiah. However, these estimates were prepared in mid-1958, and it appeared likely that the deficit by the end of 1959 would be larger. The budgetary deficit for the calendar year 1958 was officially estimated at 9.7 billion rupiah, compared with a preliminary estimate of 8.0 billion rupiah.

Notes and coins in circulation rose from 14.1 billion rupiah at the end of December 1957 to Rp. 18.4 billion by Sept. 16, 1959. Bank deposits, which totaled 7.3 billion rupiah at the end of 1958, seasonally declined to 6.7 billion by mid-1959. In response to the new monetary regulations described above, they dropped off to 4.4 billion rupiah by Sept. 16, 1959.

During 1959, Indonesia contracted some additional foreign debts, but at a slower pace than in 1958. In February 1959, the United States agreed to sell a quantity of light military matériel to Indonesia. In May, further quantities of arms and military equipment were purchased from several western and eastern European countries. The exact amounts involved in these military purchases were not made public. In July the Soviet Union made available U.S.$17.5 million for construction of a sports stadium in Djakarta and a maritime institute in Ambon.

Transportation and Communications.—According to official statistics, at the end of 1958 Indonesia had a basic road network of 46,800 miles, of which 75% was improved. The latest statistics available on motor vehicle registration show that as of Jan. 1, 1956, 195,420 vehicles were registered. No change or additions were reported on the government-owned railway system, which was reported in late 1957 to operate 3,780 miles of track, mostly in Java. The most recent statistics (for 1957) show that the railroad system transported 140,357,000 passengers and 6,158,000 metric tons of freight. The government-owned airline, Garuda Indonesian Airways, as of Sept. 1, 1959, had a fleet of 36 aircraft, and had 4 Lockheed Electra transport aircraft on order in the United States.

Economic Conditions.—Economic conditions in general showed some improvement during 1959, by comparison with corresponding months of 1958. However, the economy as a whole has not recovered to the levels reached prior to the take-over of Dutch property in December 1957, and the rebellion that began in 1958. The financing of the 1959 budgetary deficit contributed considerably to slowly rising prices during most of the year. The index of food prices (1953 = 100) stood at 241 in September 1959, compared with 233 in January. The severely deflationary measures adopted in August reduced the level of economic activity in the latter part of 1959.

On March 18, 1959, Indonesia and the United States signed an agreement providing the terms under which Indonesia could borrow rupiah accumulated under the Surplus Agricultural Commodities Agreement of 1956 for economic development purposes. These funds, valued at the rupiah equivalent of U.S.$70 million at the time of deposit, are, at the present rate of exchange, valued at a considerably smaller amount. A second surplus agricultural commodities agreement was also concluded in 1959.

Production and Foreign Trade.—Revised official statistics show that 1958 production of milled rice totaled 7,553,917 metric tons, and it was expected that production in 1959 would total about 7.7 million tons. This level of production is currently about 700,000 metric tons short of estimated annual requirements, which are slowly increasing, as the population increases by about 1.5 million persons per year.

Production of rubber amounted to 709,000 metric tons in 1958, compared with 728,000 tons in 1957. Factors in the decline apparently included dislocations to production resulting from the rebellion in Sumatra, as well as the advancing age of most Indonesian rubber trees, few of which have been replaced by newer stock. Other agricultural products such as sugar, copra, and kapok were produced during 1958 at levels close to 1957, although there were reported to be large-scale diversions of copra exports into illegal channels.

Production of crude petroleum for the calendar year 1958 was 16,110,000 metric tons, compared with 15,468,000 metric tons in 1957. Production probably would have been higher had not the principal oil-producing areas in Central Sumatra been affected by some dislocation as a result of the rebellion in that area during 1958.

As a result of the seizure of Dutch property in late 1957 and the dislocations that followed this action, as well as the rebellion which began in 1958, the value of all exports fell off by about 30% in 1958, compared with 1957. While serious balance of payments problems were encountered in 1958 and 1959, their gravity was lessened by rigid limitations on imports, which, in 1958, amounted to about 55% of imports during 1957. On the export side, Singapore continued to be Indonesia's best market, taking 24.6% of the total, followed by the United States (17.2%), the United Kingdom (12.7%), Australia (5.9%), and Communist China (5.7%). The Netherlands still took some 4% of Indonesia's exports, but this was much less than the average of 20% recorded over the last several years. On the import side, the United States continued to be the principal single source of imports (15.9%), followed by Japan (13.6%), West Germany (9.7%), the Netherlands (6.5%), and the United Kingdom (5.3%). Total exports during 1958 amounted to 8,611.5 million rupiah, while imports totaled 5,850.9 million rupiah. In spite of the apparent surplus of 2,760.6 million rupiah, large-scale purchases of military equipment and increased expenditures on invisibles, including such items as ocean freight, are reported to have produced a considerable deficit in the balance of payments.

Principal Events, 1959. *Domestic Affairs.*—Domestic affairs dominated the Indonesian political scene in 1959. The rebellion in Sumatra and Celebes continued to smolder, and the maintenance and re-establishment of security continued to occupy much of the government's attention. Deteriorating economic and financial conditions led to the adoption of a series of economic reform measures in August 1959 (see above, *Finance*). However, the single most important issues revolved around the question of constitutional reform. A Constituent Assembly had been meeting since November 1956, charged with writing a permanent basic law to replace the provisional constitution of 1950. Feeling that the process of framing a constitution was taking too long, President Sukarno proposed in February that the Assembly re-enact the constitution of 1945 which had served Indonesia in the years immediately following the proclamation of independence in 1945. Following discussions of this proposal in May, the Constituent Assembly, on June 2, failed to give it the requisite two-thirds majority, and the Sukarno proposal failed of adoption. A period of uncertainty followed as President Sukarno was abroad on a visit to Europe, the Americas, and Japan. However, on July 5, follow-

ing his return to Indonesia, President Sukarno, acting under extraordinary powers in his capacity of supreme commander of the armed forces, proclaimed the dissolution of the Constituent Assembly and the enactment of the constitution of 1945. A new cabinet was then installed, and new organs of government were established. (See above, *Government.*)

During the first nine months of the year political activity was subjected to periodic limitations or prohibitions by action of the army, on the grounds that such activity might endanger public order and safety. However, some measure of political activity continued, and in September the powerful Indonesian Communist Party held its sixth National Congress.

Among important legislation adopted was a decree promulgated by President Sukarno in September, providing for increased centralization of the administration of government. From 1957 until the president's act, some progress had been made toward decentralizing regional government. However, Sukarno and his supporters reportedly feel that extension of the powers of regional government at present would be destructive of national unity.

Foreign Relations.—President Sukarno left Indonesia on April 22 on a 68-day journey which took him to Turkey, the Soviet Union, Poland, Sweden, Italy, the Vatican, Brazil, Argentina, Venezuela, Mexico, the United States, Japan, North Vietnam, and Cambodia, before returning on June 29. During 1959, Indonesia continued to participate actively in official and unofficial conferences of Asian-African states. In January, Indonesia indicated it would not take part in a proposed Southeast Asian regional organization, on the grounds that it could best pursue its "independent and active" foreign policy within the larger context of the Asian-African community of states.

A political difference of some significance arose with Communist China in the spring of 1959 when the Indonesian government issued a regulation, effective Jan. 1, 1960, providing that foreign nationals would not be permitted to carry on retail business outside the larger cities of Indonesia. The regulation principally affected Chinese traders, many of whom claim to be citizens of Communist China. However, discussions on the implementation of the regulation were held in Djakarta, and Foreign Minister Subandrio visited Communist China in October 1959, to hold further negotiations on the subject. The issue grew hotter in November, and Dr. Subandrio issued a strongly worded statement in which he charged that Chinese embassy personnel were advising rural aliens to ignore the ban. He cautioned the Communists against "sabotaging" government regulations, and on November 18 travel restrictions were imposed on Chinese embassy personnel.

As the year ended it appeared that Indonesia would implement its new regulations on aliens engaged in retail trade despite Chinese Communist objections. In late December, Foreign Minister Subandrio publicly expressed puzzlement at the motives of the Chinese Communist government in taking such a strong stand on this issue. One consequence of the controversy was the public announcement by First Minister Djuanda that exchange of the instruments of ratification of the 1955 Sino-Indonesian Nationality Treaty would be postponed indefinitely. The treaty had reportedly been on the verge of entry into effect.

INDUSTRIAL DESIGN. There is no easy description—no "square look" or "sheer look"—that can be attached to the design year 1959, a year that seemed to be dominated less by design than by collection, exhibition, and comment on the designs of other years.

The Museum of Modern Art, New York City, held a major exhibition of "20th century useful objects" from its permanent collection, and, later, an exhibition of package design. Illinois Institute of Technology's Institute of Design sponsored a widely publicized effort to determine, by ballot, "the 100 best examples of industrial design." The Albright Art Gallery in Buffalo, N.Y., showed more than 2,500 products under the title, 20th Century Design: U.S.A. In Stockholm, Sweden, the International Council of Societies of Industrial Designers held its first general assembly, with 19 countries represented, and attempted to standardize at least some of the terminology of the profession.

Technology.—Meanwhile, designs were being created on the drawing boards that tended to reflect a strong concern for translating technological developments into products for home and industry. Two such contributions came in 1959 from the office of George Nelson. For the American National Exhibition in Moscow, Nelson designers, with Albert Dietz of the Massachusetts Institute of Technology, developed a new kind of shelter: hexangular, translucent, Fiberglas-reinforced plastic flower shapes, about 15 feet high and 16 feet across, fastened together and anchored in concrete slabs. Another Nelson innovation was a high-fidelity console, with a three-dimensional grille, for Rek-O-Kut, using Dynel in a fabric designed by F. Schumacher & Co.

The classic Speed Graphic camera was redesigned by Peter Müller-Munk Associates to incorporate materials advances (the frame is of extruded aluminum bar stock, the revolving back is of die-cast magnesium); and Henry Dreyfuss designed a strobe unit for Heiland, working with the manufacturer in developing a disk capacitor to simplify the form. RCA-Whirlpool introduced the 1959 "Miracle Kitchen," designed and constructed by Sundberg-Ferar. Using Fome-Cor, a polystyrene foam with kraft paper bonded to both sides, William Moss developed the Roll House—a neat, well-insulated portable shelter now being produced for the U.S. Army Quartermaster Corps.

Often in 1959 the designer's role was not so much to exploit technology as to express it. This was particularly true in electronics, where complex equipment requires simplification of controls and information display devices. Computers, power os-

Curtiss-Wright's Air-Car, designed to travel over both land and water on a cushion of low-pressure, low-velocity air, is shown at New York's Rockefeller Center, November 9.

UPI

cillators, and other special industrial equipment were given cleaner forms, with human engineering emphasis on clarity and operating ease. One of the smartest examples was the ITT closed-circuit camera housing by Channing Wallace Gilson and William Brewer. RCA brought "decorator colors" to the computer field with a red, blue, and yellow electronic data-processing system styled by Stewart Pike and John Vassos.

In automotive design, the major development of 1959 was the first appearance of the widely publicized "compact" cars produced by the industry's "big three"—General Motors, Ford, and Chrysler—which joined Studebaker-Packard and American Motors in the small car field. In general, auto manufacturers made no drastic style changes in 1959, and the new models for the most part were modifications of the previous year's design. The trend toward greater use of glass continued, and there was a marked tendency away from excessive chromium decoration. Some of the new models showed increased emphasis on functional lines, with design highlights molded into the body itself. (See also AUTOMOBILES.)

Packaging.—Although the presumed requirements of supermarket selling continued to be met in general with showy package art, some items were given unusually fresh graphic treatment. Notable packages in 1959 included a set of whimsical ice cream cartons by Morton Goldsholl; the Spring cigarette package by Jay Doblin, Leedia Vitale, and Ray Grove; a polyethylene bailing-sponge wrapper created for the Burgess Cellulose Co. by Dave Chapman, in which the basic color comes from the sea-blue sponge itself; the Wash-Up! package and display carton by Brownjohn, Chermayeff & Geismar (one of the few contemporary graphic designs shown at the Museum of Modern Art's package design show); and a polystyrene lid clamp designed by Smith, Scherr & McDermott to package a set of Rubbermaid nesting mixing bowls.

(For further discussions of current trends in industrial design within individual fields, see articles on such subjects as ARCHITECTURE, FASHIONS, and INTERIOR DECORATION, as well as the Index entry, *Industrial Design.*)

RALPH S. CAPLAN,
Editor, "Industrial Design."

INDUSTRIAL HEALTH AND SAFETY. Toxicity.—There was continued pressure in 1959 for more information on the toxicity and hazards associated with well-known and previously investigated substances, and with the new chemical compounds continually introduced into commerce. There are a number of reasons for this trend: a demand for safer work places, the expanded use of household chemicals, and a recognition by industry that toxicological testing must be conducted concurrently with research and development because the economic potential of a compound will never be realized if that compound cannot be handled safely.

A striking feature of recent developments in industrial health and safety has been the application of new and complex scientific methods, such as neutron activation of trace metals for the closer examination of physiological response, metabolic processes, and detoxication mechanisms. The results of such studies provide a better basis for initiating preventive measures and minimizing injurious exposures.

Comprehensive papers were published in 1959 on the toxicology of aliphatic and alicyclic hydrocarbons, and of fatty acids, aliphatic aldehydes, and alkyl derivatives of benzene. These compounds have wide application in the production of paints, solvents, fuels, plastics, resins, synthetic fibers, lubricants, pesticides, and pharmaceuticals. Additional toxicity data were published on currently important substances, such as toluene diisocyanates (used in making flexible foams), boranes (used in making missile fuels), and numerous insecticides and fungicides.

Metals.—Much attention during the year was directed toward industrial health and safety problems associated with handling metallic substances. Reports were published on the toxicity and physiological action of beryllium, uranium, vanadium, nickel, chromium, cadmium, lithium, indium, rhenium, lead, manganese, mercury, copper, yttrium, lanthanum, and niobium. Of interest was a conference on beryllium disease and its control, held at the Massachusetts Institute of Technology. The present status of available information on beryllium disease was summarized in 29 papers published in the American Medical Association (AMA) *Archives of Industrial Health,* February 1959. At a similar conference on lead hygiene, 14 papers were presented; they subsequently appeared in *Industrial Medicine and Surgery,* March 1959.

Maximum Allowable Concentration (MAC).—An International Symposium on Maximum Allowable Concentrations of Toxic Substances in Industry was held in Prague, Czechoslovakia, April 14–17, 1959. Representatives from 22 nations discussed the following: (1) definitions and concepts of MAC's; (2) criteria used in establishing MAC's; (3) MAC's in biological specimens; and (4) sampling and analytical procedures. Major discussion revolved around criteria for limits, which differ in various countries, ranging from conditioned reflexes in the USSR to clinical observations, where possible, in the United States. Action was taken toward establishing international MAC standards.

The latest list of Threshold Limit Values for the United States, published in the AMA *Archives of Industrial Health,* September 1959, contained 250 substances, plus tentative values for 25. The American Industrial Hygiene Association published material supplementing Threshold Limit Values and giving information on hazards, evaluation of exposure, control measures, and first aid and medical procedures. Also, the association issued hygienic guides for nitrobenzene, metadinitrobenzene, heptane, hexane, propylene oxide, tetrahydrofuran, polonium, selenium compounds, and titanium. In addition, The Manufacturing Chemists' Association published chemical safety data sheets giving properties and essential information for the safe handling and use of diethylenetriamine, tolylene diisocyanate, vinyl acetate, and sulfur.

Ionizing Radiation.—Exposure to ionizing radiation occurs in all areas of daily living, with total exposure being the sum of natural background radiation from cosmic rays and naturally occurring radioactive elements, exposure during X-ray diagnosis, the therapeutic use of radioisotopes, fallout from nuclear weapon testing, and the industrial application of atomic energy and other radioactive sources. The amount of radiation which can be permitted in industry is limited to the difference between the level of exposure of the general public and the accepted limits of exposure. Much emphasis, therefore, is being placed on uniform standards of radiation protection in industry.[1]

Recently, more responsibility was given to the U.S. Public Health Service for the collation and interpretation of data on environmental radiation. Federal assistance to state and local governmental agencies has increased the regulatory responsibility

[1] The National Bureau of Standards *Handbook No. 69,* June 1959, gives recent information on the maximum body burdens and maximum permissible concentrations of radionuclides in both air and water.

of these agencies. Eight states have strong radiation protection codes and require the licensing or registration of sources of radioactivity; nine other states require licensing or registration. About two thirds of the states have some general radiation protection rules, and most of the others have study committees. (See also CHEMISTRY; RADIATION; SANITARY ENGINEERING.)

New Journals.—The first issue of the *Journal of Occupational Medicine*, official publication of the Industrial Medical Association, was published in January 1959. A journal entitled *Toxicology and Applied Pharmacology* also began in January 1959. *The Annals of Occupational Hygiene* was first published by the British Occupational Hygiene Society in December 1958. *Health Physics*, official journal of the Health Physics Society, started in June 1958.

H. H. SCHRENK,
Managing Director, Industrial Hygiene Foundation of America, Inc.

INDUSTRIAL PRODUCTION. Industrial production advanced steadily through the first half of 1959 and then declined moderately primarily as a result of a prolonged work stoppage in the basic steel industry (see IRON AND STEEL). The Federal Reserve System's seasonally adjusted production index, after reaching 155 (1947–49 = 100) in June was down to 148 in October, a decline of nearly 5% from the record midyear level. A large part of the reduction represented the loss of steel output.

The steel tieup began on July 15 and continued for 116 days until November 7 (the longest shutdown in steel history), when mill operations were resumed by court order. During the strike period, steelmaking facilities operated at an average rate of 13% of rated capacity in place as of Jan. 1, 1959. The direct impact on other producing industries was relatively moderate and centered in coal and iron ore where output was at reduced levels over the entire period.

Durable goods fabricators maintained a high rate of operations out of inventories through mid-October. In the latter part of the month, however, supplies of steel were being rapidly depleted and output curtailments among steel consuming industries were spreading.

Table 1—U.S. INDUSTRIAL PRODUCTION INDEX FOR 1957–1959
(1947–49 average = 100)

Industry	1957	1958	Jan.–Oct. 1959 (seasonally adjusted)
Industrial production, total	143	134	149
All manufactures, total	145	136	152
Durable manufactures, total	160	141	162
Primary metals	131	104	116
Fabricated metal products	139	128	143
Machinery	168	145	172
Nonelectrical machinery	150	127	149
Electrical machinery	204	179	213
Transportation equipment	213	187	210
Autos, trucks, and parts	128	99	132
Other transportation equipment	344	319	322
Instruments and related products	172	164	191
Stone, clay, and glass products	155	145	166
Lumber and products	114	115	132[1]
Furniture and fixtures	120	119	141
Miscellaneous manufactures	140	133	149
Nondurable manufactures, total	130	130	143
Textile mill products	99	98	115[1]
Apparel and allied products	111	110	125[1]
Rubber products	135	125	152[1]
Leather and products	104	102	112[2]
Paper and allied products	158	160	177[1]
Printing and publishing	141	139	149
Chemicals and allied products	184	184	205[1]
Petroleum and coal products	141	134	140
Food and beverage manufactures	112	115	120[1]
Tobacco manufactures	111	118	125[2]
Minerals, total	128	117	121
Coal	83	68	68
Crude oil and natural gas	150	141	147
Metal, stone, and earth minerals	129	117	122[1]

[1] Represents data for January–September. [2] Represents data for January–August. (Source: Board of Governors of the Federal Reserve System.)

Elsewhere in manufacturing and mining, output showed little net change after June as increases and decreases among the major industry groups were generally mutually offsetting.

Industrial output was substantially higher in 1959 than in 1958 as strong business and consumer demands persisted throughout the year. The physical volume of output in the first 10 months of 1959 was 13% higher than for the same period of 1958 and 4% above the high production year of 1957.

The expansion in output in 1959 was widespread among durable and nondurable categories. All of the major manufacturing groups participated in the rise, and the year-to-year advances, as shown in Table 1, were large—though in many cases from the relatively depressed levels of 1958.

For most product groups, new production peaks were registered at various dates during the year, and in October the rate of operations, except in those industries affected by the steel situation, was at or close to record levels.

Durable Manufactures.—The steel industry, operating at an average rate of approximately 90% of rated capacity, turned out a record volume of raw steel in the first half of 1959. From mid-July through early November, the period of the strike, the operating rate was cut to about 13% of capacity, yielding a weekly output of 350,000 tons of ingot steel. This compared with a mill rate of 92% and an average weekly output of 2.6 million tons in the April–June period.

Steel producers resumed operations on November 7, and in the week beginning November 15 the scheduled weekly rate was up to 79% of capacity, equivalent in terms of tonnage to 2.2 million tons of steel. Some further advance in the output rate was expected in the weeks ahead.

In the first 10 months of 1959 the industry produced 74 million tons, and for the full year the total was expected to exceed 93 million tons, considerably above the 1958 volume although substantially below 1957 production.

Strong demand from metal-consuming fabricators stimulated output of most major nonferrous metals. The fast-growing aluminum industry (see ALUMINUM) operated at a record rate in 1959. Output in the first 9 months came close to 1.5 million tons, up more than one fourth from the volume of a year earlier. Despite prolonged work stoppages in some mines, production of copper in the first 9 months of 1959 was well above the volume in the like 1958 period. The effect of the strike in copper mining reduced output from 134,000 tons in July to 29,000 tons in September. Output of zinc also increased, although lead production declined.

Production of building materials was maintained in large volume, with lumber mills particularly active, turning out by a substantial margin the largest volume of finished lumber in the postwar period. (See also LUMBER.)

The machinery industry showed outstanding strength in 1959, as activity during the steel tie-up was sustained by drawing upon inventories built up earlier in the year. This industry, which turns out the bulk of heavy electrical and nonelectrical equipment, recorded a year-to-year advance of close to 20%, one of the largest gains among the major manufacturing industries.

Most segments within the machinery group shared in the advance. For example, the machine tool industry (see MACHINE TOOLS) in the first 9 months of 1959 stepped up dollar shipments nearly one fifth, plants producing tractors and agricul-

Table 2—LEADING UNITED STATES MANUFACTURES, 1957

Product	Total number of employees	Payroll (in thousands of dollars)	Adjusted value added by manufacture (in thousands of dollars)

(Source: U.S. Bureau of the Census, *Annual Survey of Manufactures: 1957.*)

tural machinery boosted output by 8%, and producers of excavating and earth-moving equipment expanded deliveries by about one fourth.

Production of transportation equipment was in considerably larger volume than in 1958, with all segments of the industry participating. The advance in output was particularly noticeable in the motor vehicle sector. Assemblies of passenger cars and trucks generally continued upward until August, when factory shutdowns for model changeovers got under way. Production of the new 1960 models began on a modest scale late in August and increased steadily thereafter to 158,000 in the third week of October, when steel shortages forced curtailment of production lines. During the week ended November 14, completions of cars and trucks totaled less than 80,000 units.

For the first 10 months of 1959, factory sales of cars, trucks, and buses amounted to 5.8 million units, which compared with 3.8 million in the same period of 1958 and 5.1 million for 1958 as a whole. The count for the full year 1959 was expected to total 6.7 million units. (See also AUTOMOBILES.)

Activity in aircraft plants was also higher despite the continuing shift from production of manned military aircraft to missiles and missile development work, the latter lines accounting for an increasing proportion of total output in the aircraft manufacturing industry. (See also AERONAUTICS.)

Nondurable Manufactures.—Output of nondurable goods showed a slowly rising trend in 1959, and for the first 10 months of the year the Federal Reserve index of output of these goods averaged 143% of the 1947–49 base period. This was more than one tenth higher than for the corresponding period of 1958, the previous top year, and represented the largest year-to-year advance in the post-World War II period.

In the early fall months of 1959, output was at a record rate, although there was evidence of some tapering off from peak rates in a number of industries. Production increases over the year among the major product groups varied from 5% for food and beverages to 25% for rubber products, with most industries showing advances of 10% or more.

Minerals.—Production of minerals in 1959 was only slightly above the relatively depressed level of 1958. A number of unfavorable factors accounted for this development. The cut in steel output during the strike period reduced coal and iron ore production; a large proportion of the copper mining industry was shut down from two to three months because of a work stoppage; and the unfavorable supply-demand position of refined petroleum products kept crude oil output under state production quotas during most of the year.

Annual Survey of Manufactures: 1957.—This survey, released in 1959, estimates that all manufacturing establishments operating in the United States in 1957 employed 12,841,750 production workers and 4,262,905 other employees for a total of 17,104,655, compared with 17,177,301 in 1956, and carried a payroll of $79,354,003,000. Operating manufacturing establishments in 1957 created $147,928,554,000 in adjusted value added by manufacture[1] ($144,971,368,000 in 1956), and provided $11,409,470,000 in capital expenditures, not including spending for plants under construction and not in operation.

Table 2 furnishes data for all industry groups and some component manufactures for which adjusted value added by manufacture was estimated at $1 billion or more in 1957.

INLAND WATERWAYS. In the first half of 1959 the shallow-draft water carrier industry in the United States made a strong comeback from the effects of the general business recession of 1957–58. However, the flow of traffic was interrupted in the last half of the year by the steel and dock strikes and by labor disputes within the water carrier industry itself. Total traffic in 1959 was expected to be below the 1957 record, as it was in 1958.

In 1958 an estimated 366.5 million tons of commerce[2] was transported on the 29,000 miles

[1] Adjusted value added by manufacture represents value of products shipped (including resales of finished products produced by other manufacturing establishments) less cost of products, materials, supplies, fuel, electric energy, and contract work, plus (in almost all cases) the net change in finished products and work-in-process inventories between the beginning and end of the year. The inventory figures were not adjusted for price changes.

[2] Inland waterway tonnages are classified as follows: internal traffic, 261.1 million tons; intraport traffic, 48.9 million tons; local port movements, 56.5 million tons. (Source: U.S. Army Corps of Engineers.)

of inland waterways (excluding the Great Lakes), as compared with 392 million tons in 1957—a drop of 6.5%. In 1958 inland water carriers rendered 109.1 billion ton-miles of service, or 5% below the 1957 all-time record of 115 billion ton-miles.

Principal commodities and their tonnages transported in 1958 included: petroleum and petroleum products, 134 million tons; bituminous coal and lignite, 83.8 million; sand, gravel, and crushed rock, 44 million; unmanufactured sea shells, 21.5 million; logs, 17.6 million; iron and steel products, 7.1 million; chemicals, 7.5 million; and grains, 7.0 million.

The accompanying table compares tonnages of commodities moved over 11 major waterways in 1958 with those moved in the record year 1957.

Channel	1958 tonnage	1957 tonnage
Atlantic Intracoastal Waterway[1]	3,166,155	2,885,614
Columbia River	17,600,871	20,855,073
Gulf Intracoastal Waterway	46,007,718	48,104,471
Illinois Waterway	24,488,921	24,234,066
Mississippi River[2]	75,279,676	74,599,221
Missouri River[3]	1,745,241	1,188,415
Monongahela River	28,911,161	38,420,767
Ohio River	73,476,894	81,567,152
Sacramento River	2,259,495	2,703,529
Tennessee River	12,040,826	12,742,223
Warrior-Tombigbee Waterway	5,666,203	4,873,991

[1] Consolidated total. [2] Inland traffic only. [3] Commercial traffic only.

There are approximately 1,800 firms employing about 80,000 operating personnel aboard the inland waterways fleet of 19,390 vessels (including 4,169 towboats, 12,912 dry cargo barges, and 2,309 tank barges). The cargo capacity of the inland fleet now stands at 14 million net tons, up 5% over 1956.

The use of more powerful towboats and tugs and more specialized and larger barges is enabling the shallow-draft water carriers to haul bigger loads—up to 30,000 tons of cargo in a single tow—thus helping to hold down transportation costs and to give the consumer improved service for his transportation dollar.

INSURANCE. The following article is divided into three sections, reviewing developments in (1) Life Insurance; (2) Health Insurance; and (3) Property and Casualty Insurance.

LIFE INSURANCE

American families owned about $534 billion of legal reserve life insurance at the start of 1960, with average ownership per insured family totaling over $11,500, and about 115 million policyholders contributing to this all-time record. In the decade beginning in 1950, the total amount owned has doubled, average ownership per family has increased by $5,000, and the number of policyholders has risen by almost 30 million.

Purchases of new life insurance during 1959 set an annual record, as nearly 24 million individual policies and group certificates bought in the year accounted for about $68.5 billion of new protection. This represented more ownership than the total amount in force 35 years ago and was more than three times the amount purchased ten years ago.

Keeping pace with the rapidly increasing financial responsibilities of family living, the more than 1,400 life insurance companies serving the American public have geared their operations to provide up-to-date policy contracts with advanced marketing features. Among the factors contributing to life insurance growth in recent years are the following: purchases of policies in larger amounts; more policies owned per family; the popularity of such policy innovations as the family plan, which insures all members of the family under a single policy; development of new marketing procedures, such as monthly payment by preauthorized check, premium discount for larger purchases, increased age limits for issuance of policies, and liberalized underwriting to allow greater insurability ranges for risky occupations and health impairments; and the removal of legal restrictions, such as the lowering of the minimum size of groups eligible for group insurance.

In the past decade, ordinary life insurance ownership gained by about 125%; group life insurance experienced a gain of nearly 300%; and credit life insurance increased over 900%. The trend toward the purchase of policies with higher unit values was reflected in the lower proportionate gain of about 25% for industrial insurance over the same period.

Benefit Payments.—In 1959, American policyholders or their beneficiaries were paid a record total of nearly $7.6 billion in benefits by life insurance companies and about $2.4 billion from health insurance policies. About 58% of the life insurance benefits paid in 1959 went to policyholders themselves, with the remaining 42% paid as death benefits. In the past decade, close to $55 billion have been paid in life insurance benefits.

Investments.—The total assets of the more than 1,400 legal reserve life insurance companies reached $113.6 billion at the beginning of 1960, representing a 90% increase in the last decade. These guarantees of future obligations to policyholders and beneficiaries have long been one of America's chief sources of investment capital. During 1959, about $6 billion of new capital funds were invested by life insurance companies in the nation's economy. Previously invested funds available for reinvestment brought the companies' aggregate investments made in 1959 to $19 billion. The largest block of assets was the securities of industrial corporations, railroads, and utilities, accounting for an aggregate of about $50 billion of holdings and about $6 billion of purchases in 1959. Mortgages ranked second, with total holdings of $39 billion and purchases of some $6 billion. The net earning rate on life insurance company investments, before federal taxes, rose to about 3.95% in 1959, compared with a 3.13% earning rate in 1950. Federal legislation increasing the income tax on life insurance companies by an estimated $200 million was enacted by Congress in 1959.

Other Insurance.—Although 90% of the life insurance owned in the United States is with the legal reserve life insurance companies, American families had an additional $55 billion of life insurance in force with the Veterans Administration (q.v.), fraternal societies, assessment associations, and savings banks.

Canada.—Canadian families owned nearly $42

billion of life insurance at the start of 1960. The more than 8 million Canadian policyholders constituted the highest ratio of life insurance ownership to national income of any nation reporting life insurance statistics. About $490 million was paid in life insurance benefits and annuity payments during 1959, with 63% of the total representing payments to policyholders themselves.

HOLGAR J. JOHNSON,
President, Institute of Life Insurance.

HEALTH INSURANCE

Americans in 1958 made increasing use of health insurance as a source for the payment of medical bills, as shown by reports on the number of persons insured and the amount of benefits paid. By Dec. 31, 1958, persons in the United States who were covered by some form of health insurance numbered a record 123,038,000. Protection against the cost of hospital and doctor bills has been extended to include some 71% of the nation's population.

To help the public meet the cost of accidents and sickness in 1958, some $4.7 billion was paid in health cost benefits during the 12-month period by all types of insuring organizations. In 1957 the benefit payment figure was $4.2 billion.

Within the last seven years the number of persons covered by hospital expense plans rose by 44%, while the number of those covered by surgical plans and regular medical plans increased by 72% and 172%, respectively. Major medical expense insurance coverage rose by 1,599% during the same period.

Reports from the approximately 700 insurance companies handling health insurance policies in the United States during 1958 showed that of the 123 million persons covered, nearly 72 million had such coverage under policies written by insurance companies for hospital expenses. In addition, 69 million were covered for surgical expenses, and 35 million for regular medical expenses. Loss-of-income insurance policies covered 32 million persons, and some 17 million had protection against major medical expenses. Of the total United States civilian labor force in 1958, an estimated 62%, or 42 million persons, were protected by loss-of-income insurance policies and other salary continuation plans.

It was estimated that in 1958 insurance companies alone paid benefits on 9.5 million claims for hospital expenses, representing almost 45% of the 21.6 million admissions to voluntary hospitals during the year.

Progress also was made in providing persons 65 years of age and older with health insurance. By the end of 1958 it was estimated that more than 40% of the senior citizen population had health insurance. A survey disclosed that in five years' time the number of Americans aged 65 and over increased by 13%, while senior citizen coverage rose by 65%. This progress was due in large measure to new approaches adopted by insuring organizations which enable retiring workers to continue their health insurance coverage, as well as to new types of protection which cover all segments of the population.

JAMES R. WILLIAMS,
Vice President, Health Insurance Institute.

PROPERTY AND CASUALTY INSURANCE

The year 1959 was notable for the progress made by the property and casualty insurance industry in facing up to its most complex challenges in history. As profits continued on a downward path in 1958, property underwriters suffered from an unusual increase in the severity of fires and of wind and hail storms, and casualty underwriters found automobile liability losses remaining heavy despite higher rates, while the steady volume growth of assigned risks posed an increasingly serious problem. With numerical increases of 15% in population, 20% in homes, and 100% in automobiles projected for the next decade, the industry began a thorough reassessment of traditional concepts in many areas.

Industry highlights during 1959 included an appearance of industry leaders before a Senate subcommittee conducting hearings on the adequacy of state regulation of insurance; introduction of an automobile merit rating plan in several states; the difficulty of metropolitan courts in handling the growing mass of personal injury litigation; revision of a new homeowners' policy; realignment of functions of rating and service organizations in the property field; an increase in facilities available for an insurance education; and establishment of new organizations by the industry to promote safety education and broaden understanding of insurance by the public.

A major step in 1959 was the establishment of the Insurance Institute for Highway Safety in Washington, D.C., with all-industry sponsorship of more than 500 companies (representing 90% of all automobile insurance business). The institute will launch an all-out attack on the problem of the high toll in deaths and injuries on the streets and highways.

Automobile insurance continued to be a major problem, with accident frequency and claims costs remaining high. Although pressure in some states for compulsory automobile liability insurance continues, only Massachusetts. New York, and North Carolina have this type of law. Automobile bodily injury liability was the largest classification of casualty business in terms of dollar premiums in 1958. Net premiums earned amounted to $2,209 million, while losses and adjustment expenses incurred to premiums earned totaled $1,745 million, and underwriting statutory loss, $217 million. The loss ratio was 79%.

Although a serious downturn in profits was halted at the end of 1959, many companies remained deeply in the red. In the first half of 1959 the total loss ratio declined 1.7 points to 62.3%, and dollar premium volume was up 7%.

At the end of 1958, property and casualty insurance companies had total assets of $26,309 million, while net premiums earned in 1958 amounted to $12,308 million, and loss and adjustment expenses incurred to premiums earned were $7,878 million.

INTER-AMERICAN AFFAIRS. Political Instability.— Violence and unrest characterized the pattern of Latin American domestic and foreign developments during 1959. Freed from tyrannical dictatorships, except in the Dominican Republic and Paraguay, the Latin peoples showed their deep feelings of thwarted expectation. Their hope for a better life had not materialized in the cities, to which 26 million rural Latins had moved since World War II, and their mood was exacerbated by the Communists and nationalists, and by adverse comparison of their economic situation with the prosperity of Europe and the United States.

Instability was most evident where the bankrupt heirs of corrupt dictatorships had introduced

drastic programs of social reform. After two years of bloody civil war, costing 8,000 lives and an estimated $100 million, Fidel Castro assumed political leadership in Cuba on Jan. 1, 1959. The object of genuine mass hero worship, which was sustained by his frequent television and radio addresses, Castro completely dismantled the existing army, police, government, and civil service, and set about to institute an extensive agrarian reform. Such rapidly paced changes provoked the mounting protest of affected groups whose first major effort to overthrow the Castro regime came in August, and was followed by other abortive revolts in September and October.

Although the reform measures of Venezuela's new president, Romulo Betancourt, were less ambitious than those of Castro, a riot at Caracas on Aug. 3, 1959, attributed to professional agitators, induced the government to suspend constitutional guarantees for a month. The regimes in Argentina and Bolivia incurred increasing unpopularity in the pursuance of deflationary policies inspired and supported by the United States. Rebellions in Bolivia on April 19 and again on June 27 provoked the government to impose a state of siege and press censorship.

These revolutionary programs encouraged unrest among oppressed peoples elsewhere. The Paraguayan dictator, Alfredo Stroessner, dissolved a rebellious Congress on May 30 and jailed scores of leaders in his own Colorado Party after the Congress had condemned police brutality in repressing student demonstrations. The coldly efficient dictatorship of Rafael Leonidas Trujillo Molina in the Dominican Republic confronted developing antipathy of the Roman Catholic hierarchy, the upper middle class in major cities, and student groups. Rebel hopes in these countries were raised by the anticipated assistance of exiles. Vigorous police searches and acts of terrorism in Nicaragua were followed by a bungled attempt to slay President Luis Somoza Debayle on June 6 and by student riots against the government on July 23.

Both Haiti and Honduras were torn by internal and international intrigue. Honduran President José Ramón Villeda Morales, whose two-year term had been marred by revolt, terrorism, and squabbles with neighboring countries, successfully withstood a rebellion on July 12–13. With his government sustained financially by means of a United States grant of $6 million, Haitian President François Duvalier maintained a perilous hold on the country in spite of a coronary occlusion suffered May 25, periodic revolts, and the opposition of the Roman Catholic Church over the expulsion from Haiti of two priests on August 18. Disenchantment with politicians was nowhere more evident than in inflation-burdened Brazil where a baby rhinoceros received the largest vote in a municipal council election in São Paulo on October 4.

Caribbean Unrest.—Domestic unrest spilled over national boundaries in the Caribbean area. Castro's success in Cuba encouraged rebels bent on social reform elsewhere; international radio programs in Venezuela and Cuba condemned the dictatorships in Nicaragua and the Dominican Republic; and national legislatures in Venezuela, Costa Rica, and El Salvador endorsed opposition to the Somoza regime in Nicaragua. The former president of Costa Rica, José Figueres, lent his prestige to revolutionary factions in both the Dominican Republic and Nicaragua. Exiles from Panama, Nicaragua, Cuba, and the Dominican Republic assembled men and arms on unguarded borders to overthrow the governments in their respective countries. By March, Costa Rica had become the principal asylum for fleeing Nicaraguans, while Cuban and Dominican exiles, operating without the law in the United States, were supplying illicit weapons to their allies in Cuba.

Although the Castro administration did not prevent all armed bands from organizing in Cuba and departing from its territory, it arrested (April 18) more than 100 Nicaraguans training on its shores and stopped (May 6) a group of 22 Cubans from joining the Nicaraguan rebels. Honduras and Nicaragua agreed to prevent their territories from being used to mount rebellions against each other on February 26. The Honduran government of President Villeda Morales lost favor with its own Liberal Party when on three occasions between June 27 and July 13 it disbanded Nicaraguan exiles who were preparing to overthrow the Somoza regime. Costa Rican President Mario Echandi Jiménez risked his popularity by enforcing his country's neutrality in the Nicaraguan revolt; on March 20 he instituted emergency measures to keep his country's borders from becoming a rallying ground for Caribbean revolutionaries, and on August 10 he established a military zone 15½ miles deep along the Nicaraguan border to prevent attacks on Nicaragua.

Guatemalan President Miguel Ydígoras Fuentes, in soliciting nationalistic support for his faltering regime, charged the Mexican government with encouraging Guatemalan exiles to attack his country. Diplomatic relations between the two countries, which were severed on Jan. 23, 1959, as a result of an attack in late 1958 by a Guatemalan Air Force plane on three Mexican shrimp boats, were resumed on September 15.

Inter-American Peace Machinery.—Panamanian President Ernesto de la Guardia, Jr., invoked the peace machinery of the Organization of American States (OAS) on April 28 after Roberto Arias, a reckless young member of the Panamanian oligarchy, and 87 mercenaries whom he had assembled in Cuba attempted to overthrow his administration. An investigating committee appointed by the OAS Council left for Panama that very day, and the United States, Colombia, Ecuador, and Guatemala responded to the council's recommendation that Panama be given military assistance. After Cuban cooperation was evidenced both in the deliberations of the council and in the interception of two supply ships destined for the rebels, the rebel forces surrendered on May 1.

The OAS withheld immediate support for the authoritarian governments in Nicaragua and the Dominican Republic. After 110 airborne exiles invaded Nicaragua from Costa Rica on May 31 and June 1, an investigating commission was appointed at an emergency session of the OAS Council to determine whether this might be a domestic affair which would preclude regional action. The commission delayed its departure to the area until June 14, by which time most of the poorly equipped rebels, who had found support neither from the Nicaraguan people nor the National Guard, had surrendered. The Dominican Republic requested the assistance of the OAS Council on July 2 to forestall anticipated raids by Cuba and Venezuela, but withdrew the request July 10 when it was clear that assistance would be denied. A majority of the member states disliked the Trujillo regime and feared the withdrawal of Cuba and Venezuela in the event of OAS action.

In view of the unstable Caribbean situation, the United States and several South American countries proposed the Fifth Meeting of Consultation of Ministers of Foreign Affairs, which was convened August 12–18, 1959, at Santiago, Chile. The conference agenda called for a review of Caribbean problems and a study of the "effective ex-

AMERICANA MAP BY DONALD T. PITCHER

ercise of representative democracy." The conferees concluded with a strong reaffirmation of the nonintervention doctrine and with the restoration of power to the Inter-American Peace Committee which would permit it to investigate any situation without the prior approval of the accused or accuser nation. The Declaration of Santiago restated the necessary conditions for democracy, and thereby made it abundantly clear that dictatorships of the sort that existed in the Dominican Republic were repugnant to the other nations.

After a short period of troubled tranquillity, the Caribbean erupted again in October when Fidel Castro, increasingly besieged by defections and revolts, appealed to zenophobic nationalism by accusing the United States of permitting planes to be launched from Florida to bomb Cuba. Panamanian students, prompted by Aquilino Boyd, an aspirant for the presidency in the 1960 elections, encountered forceful opposition from United States troops when they raised the Panamanian flag in the Canal Zone on Nov. 3, 1959. Hurried consultations with United States officials and subsequent demonstrations resulted in United States acceptance of Panama's demands that all Canal Zone merchandise would be purchased in Panama, that wage adjustments for Panamanian laborers working in the zone would be made, and that serious consideration would be given to flying the Panamanian flag along side that of the United States in the Canal Zone. On November 14, President Eisenhower announced the appointment of a six-member National Advisory Committee on Inter-American Affairs which would consider current and long-range problems.

Communism.—Deteriorating economic conditions, together with greater political freedom which accompanied the demise of dictatorships, provided Communists with both an issue and the means for increased activity in Latin America. By 1959 the number of Communist Party members had grown to an estimated 240,000. Although Latin American trade with the Soviet bloc in 1958 increased substantially over that in 1957, its proportion to the entire trade was negligible. In 1959, Cuba turned to the USSR as a market for its surplus sugar, and Brazil dispatched a seven-man trade mission to Moscow in November. Peking was displacing Moscow as a mecca for Latin leftists; 37 delegations from Latin America visited the USSR and China in 1958, and 40 such delegations, including one led by Mexico's former president, Lazaro Cardenas, had entered China by August 1959. Together, the USSR and China were spending an estimated $100 million annually on propaganda in Latin America.

While avowed Communists were not among the key decision makers, their influence in secondary roles was nonetheless disturbing. The United States representative to the OAS, John C. Dreier, declared on July 10 that they had infiltrated the revolutionary movements in the Caribbean. Nicaraguan exiles declared in August that a Cuban Communist was "in charge of Caribbean affairs" and that they had been instructed by the president's brother, Raul Castro, to "form a popular front with the Communists." If Cuba was doing nothing to suppress the Communists, President Ydígoras of Guatemala was encouraging their separate development in an effort to divide his leftist opposition. However, the Frondizi government in Argentina, which had embarked on an unpopular economic program, initiated court action in October to disfranchise the Communist Party in that country. (See also COMMUNISM.)

Economic Affairs.—If nationalism restrained vigorous inter-American cooperation, the Latin economies were nonetheless more dependent than ever on United States assistance. The annual rate of growth in the gross national product had fallen from 7% in the early 1950's to 2½% in 1958, and a teeming population was matching the rate of economic development. Monetary stabilization policies, necessary for effective planning, made slow headway against the opposition of labor, business, and military

groups. Terms of trade and foreign markets had deteriorated; foreign exchange reserves needed for capital goods had shrunk.

Vice President Richard M. Nixon's trip to South America in May 1958 had prompted a reappraisal of United States economic policy toward the area; the new approach promised a collective attack on the economic and social roots of communism. In supporting the charter for an inter-American bank, which was readied for signature in Washington, April 8, and which won final congressional approval on August 19, the United States was abandoning its traditional opposition to an institution much desired by the Latin countries. The United States agreed to contribute 45% of the $1 billion of subscribed capital—$850 million of which would support an Inter-American Development Bank and $150 million for a Fund for Special Operations. The Development Bank would extend loans, repayable in dollars, for wealth-producing projects; and the Special Fund would provide capital for undertakings unacceptable as bank risks to be repaid in local currencies. The bank and fund would begin functioning in Washington, D.C., about June 1960 and would supplement the five international lending institutions already available to Latin governments.

The new United States approach won the support of the Latin American countries at the second session of the Special Committee to Study the Formulation of New Measures for Economic Cooperation (Committee of 21) in Buenos Aires, April 27–May 8. Cuban Premier Castro's proposal for a 10-year, $30 billion Latin-American development fund to be financed by the United States was withdrawn on May 7. The conferees entrusted the OAS with the preparation of projects to stimulate public and private investment, technical assistance, and commodity marketing and production studies. (See also FOREIGN INVESTMENTS.)

United States and European demand for Latin exports was not keeping pace with the supply of these commodities; in 1958, United States imports from the area were $3.6 billion (5% below 1957), and they totaled $1.79 billion in the first half of 1959. Latin export prices continued to fall; average Brazilian coffee prices dropped 15% in 1958 and another 12% in the first half of 1959. Again, the United States assisted the conclusion of a new international coffee agreement, effective as of Oct. 1, 1959, which was signed at Washington on September 24 by the 15 Latin coffee-producing countries and by France and Portugal on behalf of their African dependencies. Similar cooperative efforts assured the orderly marketing of sugar, cotton, lead, and zinc.

The Trade Committee of the U.N. Economic Commission for Latin America, which met in Panama City on May 11–19, endorsed the principle of economic integration by means of a common market. Implementation of this principle was included in the Multilateral Treaty of Free Trade and Central American Economic Integration, which went into effect on June 2, when Guatemala's ratification was deposited with the OAS, following those of Nicaragua and El Salvador. While only a small part of the Central American trade was regional, it was expected that new industries in each of these countries would expand their markets in the future. Seven South American countries (Argentina, Bolivia, Brazil, Chile, Paraguay, Peru, and Uruguay) endorsed a draft treaty for a common market in Montevideo, Uruguay, on Sept. 30, 1959. (See also INTERNATIONAL TRADE.)

The newly organized Inter-American Nuclear Energy Commission, a semiautonomous organization formed to encourage cooperative research in the development of atomic energy for peaceful economic purposes, held its first meeting at Washington on Oct. 20–24, 1959. The commission elected Dr. Guillermo Sevilla-Sacasa, Nicaraguan ambassador to the United States, as its first chairman.

UPI

Members of a special commission, set up by the Council of the Organization of American States, begins its inquiry (June 5) into an invasion of Nicaragua by rebels based in Costa Rica. OAS delegates on the panel are (from left) Italo Zappa of Brazil; Vincente Sanchez Gavito of Mexico; Julio LaCarte of Uruguay; and John C. Dreier of the United States. Nicaraguan forces quelled the invasion in two weeks.

(See also ORGANIZATION OF AMERICAN STATES and articles on the countries named in this review.)

Associate Professor of Political Science, Stanford University.

INTERIOR DECORATION. From the outset, 1959 showed a strong tendency for overscaling in furniture, in patterns of fabrics and wall coverings, and in accessories. This trend, in combination with the use of stronger, bolder colors, generally resulted in an architectural effect for both interiors and their furnishings. The preference for the outsize reached its apex in bold traditional styling with a return to a 17th century manner which reflected no specific period or country of origin, and in contemporary design with tall corner cabinets and other pieces in walnut that almost reached the ceiling and broke with the horizontality of the past.

Furniture.—The use of at least one magnificently scaled item of furniture was reflected in the Futura collection by Romweber, the Baroque group by Kittinger, the Laureate selections by Heritage, and the new French provincial furniture by Tomlinson, all characterized by bold designing, architectural detailing, and rich wood graining. Upholstered pieces tended generally to velvet, represented by the new hand-printed cottons by Patterson; to heavy linen in bold pattern, as re-

Three of the leading personalities who were involved in the unrest and strife which dominated inter-American affairs in 1959. (*Left*) Generalissimo Trujillo, dictator of the Dominican Republic, faced growing opposition from domestic and exiled factions. (Center) Fidel Castro, shown (above center flag) addressing rally in Havana, Cuba, antagonized some elements by his reforms. (*Right*) Alfredo Stroessner, longtime dictator of Paraguay, enforced stern measures to suppress opposition.

WIDE WORLD

DESIGN CENTER FOR INTERIORS

French period room, featuring designs by Yale R. Burge, includes wormy chestnut cabinet and lacquered coffee table, both Louis XVI; Regency sofa, covered to match the draperies; Charles X tole oil lamp set on an 18th century tier table; and a Directoire bird cage suspended from ceiling. Floor covering is of white vinyl, with black sisal area rug.

leased by Jack Lenor Larsen and David & Dash; or to rich and colorful crewel embroideries from Arthur H. Lee. The large scaling of furniture was also expressed in special cabinets styled by Drexel for television and high-fidelity sets.

The 17th century styling was made further evident in new chairs with X-bracing, by Probber, a modern rendition of the antique; in area rugs by V'Soske and Alpujarra rugs by Stark; white-on-white fabrics from Patterson; rich textural silks by Scalamandre; overscaled pattern and rich textures of wallpapers (Texture-Flex) from Katzenbach & Warren; and black wrought-iron furniture, brightened with brass accents in the Spanish manner, by Continental.

A bright note in the style picture was the appearance of Directoire furniture, copied in polished steel for the first time from 19th century French originals. The designers of these adaptations were Paul M. Jones and David Barrett, who also offered wire examples which were lacquered black. Other metal furniture included a polished stainless steel modern group by Dunbar; examples in the same contemporary styling for offices, by Steelcase; and a grouping of executive furniture in cast aluminum and walnut by JG Furniture from models created for the new U.S. Air Force Academy at Colorado Springs, Colo.

This sturdy quality in design, forming accent furniture of distinction, was observable also in Early American styling in the Cabot collection at Vanleigh, in new additions in American Colonial cherry by Statton, and in reproductions by Roundtree; and in modern furniture, based on Early American and Scandinavian precedents, by Directional, Risom, and Widdicomb-Mueller (designs by Nakashima), all blending handsomely with contemporary or period styles.

For terraces and porches, rattan and reed furniture was of graceful design and more attractive than ever in the new renditions by Whitecraft, in the designs of Oriental inspiration comprising Ficks' Mandalay group, and in the smart Edwardian designs by Tropi-Cal.

Fabrics.—Fabrics ranged from colorful chintz in floral patterns, as featured by Brunschwig & Fils, to exotic multicolored silks from the Orient, by Thaibok and Far Eastern. This lure for elegance in upholstery and drapery fabrics was evident also in richly woven textiles of fabulous patterns and hues in the new collections of Fortuny, Bergamo, J. H. Thorp, Schumacher, Stroheim & Romann, and Jofa. These fabrics embraced floral prints of traditional pattern; unusual textures exemplified by those of Tycora yarn, first introduced in jet plane upholstery; and fascinating modern patterns reflecting high standards of elegance and craftsmanship.

Wall Coverings.—Wallpapers were an important medium for achieving the new "architectural" look, with designs of friezes, dadoes, pilasters, capitals, and overdoors provided by Louis Bowen, Nancy McClelland, Piazza, and Jones & Erwin, the latter also offering new stencil patterns taken from old New England houses. The fascinating texture of hand-woven materials, including grasscloth and silk, was imitated in such sturdy, nonfading vinyl fabrics and wall coverings as Vicrtex by Carpenter, Tessara by Columbus Coated Fabrics, and Koroseal rough textures by Goodrich.

Leather was rarely more important than in 1959, when it appeared in woven, braided, twisted, and embossed forms. It was used as carpeting by Karl Mann, and was obtainable in hexagons or squares as wall covering from Katzenbach & Warren and, in 14 metallic colors, from Adams.

Floor Coverings.—Vinyl floor coverings were extremely popular in 1959. They varied from those by Congoleum-Nairn, the first firm to introduce vinyl flooring, to those in a new color range by Robbins, and included vinyls by Armstrong and Amtico. Amtico made available custom floors to match any wallpaper or fabric.

Lighting.—In illumination the new trend was toward indirect diffusion rather than floodlighting and spotlighting. The effect was achieved through the use of tall lamps and wall fixtures, with particularly noteworthy examples in stained glass by Raymor and by Art Glass for Interiors. Lamps were more individualized, generally being made from vases with a bold, hand-made look, such as those created by Lee Rosen for Design-Technics.

Accessories.—The year's new note in accessories was a great revival in the use of artificial flowers and plants, which appeared more realistic than ever. High on the preferred list of accessories were screens of all types, particularly those of laminated plywood, or fretwork, by Gery Hecht and by Mayor.

INTERNATIONAL ATOMIC ENERGY AGENCY. Formally established on July 29, 1957, the International Atomic Energy Agency (IAEA) is an intergovernmental agency of the United Nations (but not one of its 12 specialized agencies). Following the inclusion of Iraq in the IAEA on March 4, 1959, the agency had a total of 70 member nations.

Set up to promote the development of atomic power for peaceful applications, the IAEA was intended particularly to act as an international center to supply smaller nations with nuclear ma-

terials and equipment. The actual program of the IAEA, however, has largely been limited to organizing international scientific meetings and to providing technical training and advice. In its first two and one-half years of operation, the IAEA supplied only one country (Japan) with nuclear materials, to be used for a research reactor.

The chief organs of the IAEA are the General Conference, in which each member nation is represented by one delegate, and the Board of Governors, consisting of 13 members (including Canada, France, the Soviet Union, the United Kingdom, and the United States) designated by each outgoing board, and 10 members elected for 2-year terms by the General Conference. The director general of the agency is W. Sterling Cole, a former United States congressman, who began his 4-year term on Dec. 1, 1957. The chairman of the Board of Governors is Donald Sole of South Africa, elected for a 1-year term on Oct. 5, 1959.

The General Conference held its third annual session at Vienna, the agency's headquarters, on Sept. 22–Oct. 2, 1959. A regular budget of $5,843,000 for the fiscal year 1960 was approved, along with an operational budget of $1.5 million. Dr. Hiroo Furuuchi was elected president of the conference by a vote of 39 to 15.

On Sept. 26, 1959, the IAEA provisionally adopted a set of principles intended to prevent the diversion to military applications of nuclear materials in international trade. The action was important chiefly because it prepared the way for the eventual channeling of trade in atomic fuels through the agency. On Oct. 1, 1959, John A. McCone, chairman of the U.S. Atomic Energy Commission, announced that details of United States–Soviet cooperation in developing peaceful uses of atomic energy would be arranged through the IAEA.

INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT. Also known as the World Bank, the International Bank for Reconstruction and Development is an international financial agency owned and operated by its 68 member nations. The bank lends only in member countries or their territories. The borrower may be a government, a governmental agency or subdivision, or a private enterprise, but in the latter instance repayment must be guaranteed by the member government concerned. At the close of its 13th fiscal year, on June 30, 1959, the bank had lent a cumulative total of $4,426 million in 234 separate loans in 50 countries.

In the fiscal year 1959, the bank lent $703 million (only $8 million less than the record high established the previous year), and so for the second consecutive year loans were about 75% higher than the average for 1954–57. Of the $703 million, about 50% went to Asia, 19% to Latin America, 17% to Africa, and 15% to Europe. Loans were made in Gabon, Malaya, and Sudan for the first time, and single and multiple loans in 16 other nations brought the total for the year to 30.

The pattern of lending, as in previous years, emphasized basic projects essential for economic development. Electric power loans accounted for $294 million of the total; these funds will be applied in Austria, Brazil, Ceylon, Colombia, Denmark, El Salvador, Honduras, India, Italy, Japan, and Malaya. Transportation loans totaled $257.2 million for roads, railroads, or ports in Ecuador, El Salvador, India, Iran, Peru, and Sudan. Loans to industry (mainly steel, paper, and mining) accounted for $149 million; enterprises in Finland, Gabon, Italy, Japan, and Sicily will benefit from these investments. Farming in Costa Rica will be helped by a $3.5 million loan; this was the year's only agricultural loan, but in many instances agriculture is profiting indirectly from loans for projects such as highways and electric power development.

Net earnings in fiscal 1959, aside from loan commissions, were $46.5 million, up $4.5 million over the previous high attained in 1958. Reserves reached $420 million, an increase of $70 million during the year, while loan disbursements increased to $583 million, as compared with $499 million the year before. Sales to other investors of parts of World Bank loans totaled $148 million, an increase of $49 million over the previous high of 1955. Borrowing, although substantial at $432 million, was down compared with the year before when it totaled $650 million. Only one issue of the bank's bonds was sold in the United States, while three quarters of the $432 million was borrowed abroad. Public offerings of the bank's bonds were sold for the first time in Germany and Belgium, and the German issue was the largest non-dollar sale in World Bank history.

On Sept. 15, 1959, the bank's authorized capital was increased from $10 billion to $21 billion. Most member governments are doubling their capital subscriptions to take up the new stock, and the governments of Canada, Germany, Japan, and 14 other countries are making even greater additions to their subscriptions. When all the new subscriptions have become effective, the bank's total subscribed capital will be approximately $19 billion.

SUBSCRIPTIONS OF MAJOR WORLD BANK MEMBER NATIONS
(In millions of dollars)

Country	Old subscription	New subscription	Subject to call
United States	3,175	6,350	5,715
United Kingdom	1,300	2,600	2,340
France	525	1,050	945
West Germany	330	1,050	945
India	400	800	720

When the new subscriptions are complete, about one tenth of the bank's capital will be paid in. The bank will be able to call on the remaining nine tenths if it should ever need additional funds to pay off what it has borrowed from other investors through the sale of its bonds and notes. The major part of the bank's capital, in effect, constitutes a guarantee of the agency's obligations; and the result of increasing the subscribed capital is to increase the bank's ability to borrow funds.

DAVIDSON SOMMERS,
Vice President, International Bank.

INTERNATIONAL CONFEDERATION OF FREE TRADE UNIONS. The tenth-anniversary congress of the International Confederation of Free Trade Unions (ICFTU), held at its world headquarters in Brussels, Belgium, in December 1959, witnessed the greatest upsurge of African trade union influence in the history of the organization. This did not come about because of large African labor organizations, comparable in any way to the AFL-CIO in the United States, the British Trades Union Congress, or the German Federation of Labor. On the contrary, the trade unions in Africa are small, with the exception of those in Morocco, Tunisia, Ghana, and Tanganyika, but they all are burgeoning.

The reason for the growing influence evidenced at the congress in Brussels is the accelerating movement among many African countries for independence, which has had, as one of its concomitants, an interest in trade unionism. In this area, the ICFTU has pioneered for the past five years,

and at the 1959 conference African labor leadership moved to positions of specific responsibility within the organization.

During the congress, the ICFTU added another seat on its executive board for Africa; placed an African on its powerful subcommittee; elected an African vice president; established an African regional organization comparable to ones in Asia, Europe, and the Americas; virtually agreed to assign a top official to work full time on African labor matters; and invited African unions to send selected members to Brussels to work within the secretariat. In addition, the ICFTU, with its associated trade secretariats, will undertake to support a continentwide union organizing campaign in agricultural and industrial fields.

One of the ICFTU's problems has been the efforts by Prime Minister Nkrumah of Ghana and President Touré of Guinea to create a "neutralist" Pan-African labor federation with no ties to the international group. Ghana's labor movement had been an ICFTU affiliate but withdrew in 1959; Guinea's labor organization, headed by Touré, has never been a member of the ICFTU. Despite the Ghana-Guinea labor alliance, which the ICFTU believes is based more on political strategy than on trade union effectiveness, budding labor movements in other parts of Africa have chosen to remain within the ICFTU. Significantly, the Nigerian labor movement, in a country which is due to become independent in October 1960, elected to join the ICFTU. Another problem for the ICFTU has been the visible drive for influence in African labor circles by international communism, thus far with limited success.

Although Africa was predominant in the congress' proceedings, there were other politico-economic issues which figured importantly in the discussions and actions of the delegates, who represented almost 100 labor organizations in virtually every country in the free world. One of these actions called for a consumers' boycott of exports from the Union of South Africa as a weapon of reprisal against that country's continued policy of apartheid. The delegates also decided to find ways and means of enlisting ICFTU-affiliated unions in countries which import South African goods and commodities in the effort to establish an economic blockade.

The ICFTU congress also attacked the Soviet Union for its suppression of freedom in Hungary, and Communist China for its suppression of Tibet, its aggression against India, and its support of pro-Communist insurgents in Laos. President Eisenhower's visit to General Franco in Spain on his December tour was deplored because, the congress felt, it recognizes "the legitimacy of his [Franco's] tyrannical regime and [is] a sign of political friendship."

Internally, the ICFTU moved to strengthen its secretariat by directing the executive board to undertake a six-month study of the problem of "reorganization as it relates to structure, resources, officers and personnel," and to take appropriate action by June 1960. The congress re-elected J. H. Oldenbroek, general secretary of the ICFTU since its inception, for a fifth term, and Arne Geijer, head of the Swedish Federation of Labor, to a second term as president.

ARNOLD BEICHMAN,
Public Relations Representative, ICFTU Office in New York.

INTERNATIONAL COURT OF JUSTICE. See INTERNATIONAL LAW; UNITED NATIONS.

INTERNATIONAL DEVELOPMENT ASSOCIATION. Member nations of the International Bank for Reconstruction and Development (q.v.) approved on Oct. 1, 1959, a proposal by the United States to draw up a charter for a new financial agency to be called the International Development Association (IDA). The institution will be closely affiliated with and administered by the World Bank.

The main purpose of IDA will be to channel economic development capital from the industrial nations of the world to the underdeveloped countries. The operating practices of IDA have yet to be drawn up; however, it will finance only sound projects of high developmental priority.

Late in 1959 the charter of IDA was being drafted by the executive directors of the World Bank. This charter will be submitted to the bank's 68 member governments for ratification some time in 1960, and the new association might, therefore, come into being during the year. Informally, it has been agreed that IDA will have initial resources equivalent to about $1 billion, of which the United States share would be about $320 million.

DONALD W. DRESDEN,
Washington, D.C.

INTERNATIONAL FINANCE CORPORATION. The International Finance Corporation has concluded its third year of activities as an international investment institution. The IFC's membership consists of the governments of 58 countries, which together subscribed the corporation's capital of $95 million.

By September 1959, the IFC had made 28 commitments totaling $23,762,000 in 13 member countries. The distribution of the corporation's commitments among various industrial enterprises in these countries was as follows (with the number of separate commitments in parentheses):

Australia (2)	$ 885,000	Iran (1)	$ 300,000
Brazil (6)	6,807,000	Mexico (2)	1,120,000
Chile (4)	5,600,000	Pakistan (2)	1,380,000
Colombia (2)	1,500,000	Peru (3)	1,930,000
El Salvador (1)	140,000	Thailand (1)	300,000
Guatemala (1)	200,000	Venezuela (1)	1,250,000
India (2)	2,350,000	Total	$23,762,000

After the deduction of operating expenses of $1.4 million, the IFC's net income for the fiscal year ended June 30, 1959, was $1.7 million.

J. G. BEEVOR,
Vice President, IFC.

INTERNATIONAL GEOPHYSICAL YEAR. Although the IGY of 1957–58 is history, its legacy of strong international cooperation in geophysics remained alive in the International Geophysical Cooperation —1959 (IGC-59). The agreement to continue worldwide, cooperative research in geophysics was made by the IGY coordinating body, Comité Spécial de l'Année Géophysique Internationale (CSAGI), at its Fifth Assembly, held in Moscow in August 1958. The IGC-59 was conducted on the same general plan as the IGY but on a scale determined by each participant.

A program for IGC-59 was adopted by the International Council of Scientific Unions (ICSU), parent body of the IGY, in October 1958. It also established a Special Committee for Inter-Union Cooperation in Geophysics (SCG) to continue the coordinated studies of the IGY. The United States role in IGC-59 was directed by the U.S. National Committee for IGY (Joseph Kaplan, chairman).

To continue the cooperative research initiated by the IGY, ICSU established several bodies: the Committee on Space Research (COSPAR), Special Committee on Antarctic Research (SCAR), and Special Committee for Oceanic Research (SCOR).

A permanent International World Days Service (IWDS) was set up to continue the warning alert system in solar and upper atmosphere studies. Responsibility for a new World Magnetic Survey was assigned to the International Association for Geomagnetism and Aeronomy, which will study the world's magnetic field for the next few years.

Under the IGY program, 67 nations[1] and over 10,000 scientists participated (from July 1, 1957, to Dec. 31, 1958) in the greatest examination ever made of the planet earth. Tremendous quantities of data—thousands of miles of recordings and thousands of tons of records—have been amassed and deposited in data centers. Data Center A is located in the United States, Center B in the USSR, and Center C is divided among western Europe, Australia, and Japan. Each center houses copies of the original data and provides facilities for research. A complete evaluation of the IGY achievements still awaits large-scale analysis of the data.

Perhaps the greatest accomplishment of the IGY and IGC has been the wholehearted international scientific cooperation that the programs engendered. The studies stimulated thought and research even in fields outside the geophysical sciences (for example, space experiments in physics, and biology research in the Arctic and Antarctic). As a result of the IGY, the ICSU has emerged as the most powerful nongovernmental scientific body on earth.

Space Research.—The most spectacular events of the IGY-IGC were the launching of artificial satellites by the United States and the USSR. Observations on satellites indicated that the earth is very slightly pear-shaped (with the stem end near the North Pole), and that it does not bulge at the equator to the extent previously thought. Sea level in the north polar regions is apparently about 50 feet higher than had been believed. Satellite experiments revealed three intense bands of radiation (the so-called Van Allen belts). These crescent-shaped regions of space contain charged particles trapped in the earth's magnetic field. Three small atomic bombs (Project Argus), detonated at high altitudes in the South Atlantic in August and September 1958, created a temporary radiation belt between the Van Allen layers.

The electron density distribution of the outer ionosphere decreases about five to six times more slowly than the corresponding increase from the bottom of the ionosphere to 300 kilometers. Derived electron concentrations (per $cm.^3$) are as follows: at 400 km., 10^6; at 1,150 km., 10^5; and at 3,100 km., 10^3. At 1,000 km. the atmospheric number density is about 7×10^6 per cm^3. The atmosphere merges with interplanetary space near 3,000 km. from earth.

Observations aboard the third Soviet moon rocket (launched Oct. 4, 1959) showed that the moon possesses only a weak magnetic field and is not enveloped by radiation belts. Ion densities increased within some 10,000 km. from the moon. Photographs of the far side of the moon, taken at a distance of 37,000 to 43,000 miles from the moon, indicated that apparently only 10% of the far side is covered with "seas," as compared with 30 to 35% on the side visible from earth. (See also ASTRONOMY; ATMOSPHERE RESEARCH; SPACE FLIGHT.)

Antarctic.—From an analysis of seismic waves, the 5,100,000 square miles of Antarctica were shown to be mainly continental in character, although the ice also caps a large number of islands. A major geologic division seems to exist between eastern and western Antarctica. Precipitation during the past 50 years was only half that of the Arctic. Estimates of the amount of ice and snow in Antarctica have been revised, bringing the world total from 3¼ million cubic miles to 4½ million cubic miles. The lowest temperature on earth, −87.4°C. (−125.3°F.), was registered at Vostok Station. Significant contributions were made to Antarctic geography, and nonflowering plants (algae, lichens, and mosses) were found to have a remarkably wide distribution throughout the ice-free areas. (See also ANTARCTICA.)

Arctic.—While little life was found on the ocean bottom, several varieties of life (sponge, shrimp, fish, and sea anemone) were photographed on a newly discovered underwater plateau about 8,100 feet above the ocean floor. Signs of life were sparser than in the Atlantic. Rocks of all shapes and sizes, abundantly scattered about the bottom, appear to be a general characteristic of the Arctic Ocean floor. A positive heat balance was found, leading to the belief that if the present Arctic ice pack were melted it might not reform. The four drifting stations which had been established (Stations A and B by the United States and SP6 and SP7 by the USSR) on the floating ice made extensive geophysical measurements. Stations C and SP8 replaced A and SP7, which were closed by ice degeneration. SP6 was abandoned on Sept. 14, 1959; Station C, in January 1960. (See also ARCTIC EXPLORATION.)

Summary of Findings.—Although a considerable portion of the IGY data still awaits analysis, some results are available.

Aurora and Airglow.—The orientation of rays and arcs with respect to the magnetic meridian is different in Antarctica than in the Arctic. These and other puzzling events may arise from the intense magnetic anomalies found near the southern auroral zone. Intense night airglow radiations have been found in the infrared (1.2–1.9 microns) zone. (See also ATMOSPHERE RESEARCH.)

Cosmic Rays.—Bremsstrahlung (electromagnetic radiation) from auroral protons were observed from balloons. Nonrelativistic solar protons were discovered and investigated. The cosmic ray equator, which was expected to follow the geomagnetic equator, was found to be skewed westward by as much as 45°. A background count of 1.8 per $cm.^2$ per second was found outside the Van Allen radiation belts.

Geomagnetism.—An unexpected minimum (of 400 gammas) in magnetic field strength was found about 20,000 km. from the earth. The field increased to 800 gammas at 22,000 km., roughly near the peak intensity of the outer Van Allen radiation zone. High-altitude atomic detonations were found to produce magnetic changes. New magnetic anomalies were found in the Atlantic.

Glaciology.—The Antarctic ice survey, which mapped the terrain below the icecap, revealed about three times more ice than was expected. The ice was 14,000 feet thick in some locations. Cores from the 1,400-foot bore hole in Greenland and the 1,000-foot bore holes in Antarctica are under examination to determine past climatic conditions. (See also ARCTIC EXPLORATION.)

Gravity.—The international network of gravity bases was extended and strengthened. National bases were integrated into a unified network, and their accuracy evaluated. Extensive gravimetric surveys of Antarctica were made. Satellite observations allowed refined determinations of the first and third gravity potential functions (the third har-

[1] The 67 participating nations are: Argentina, Australia, Austria, Belgium, Bolivia, Brazil, Bulgaria, Burma, Canada, Ceylon, Chile, Colombia, Cuba, Czechoslovakia, Denmark, Dominican Republic, British East Africa, Ecuador, Egypt, Ethiopia, Finland, France, German Democratic Republic, German Federal Republic, Ghana, Greece, Guatemala, Hungary, Iceland, India, Indonesia, Iran, Ireland, Israel, Italy, Japan, Korean Democratic People's Republic, Malaya, Mexico, Mongolian People's Republic, Morocco, Netherlands, New Zealand, Norway, Pakistan, Panama, Peru, Philippines, Poland, Portugal, Rhodesia and Nyasaland, Rumania, Spain, Sweden, Switzerland, Taiwan (Nationalist China), Thailand, Tunisia, Union of South Africa, USSR, United Kingdom, United States, Uruguay, Venezuela, Vietnam Democratic Republic, Vietnam Republic, and Yugoslavia. Although Communist China withdrew from the IGY in protest over the inclusion of Nationalist China, a large geophysical program was established and implemented for both IGY and IGC. The meteorological network on the Chinese mainland was expanded considerably, geophysical observatories were established, and research in most geophysical fields was undertaken. Data have been exchanged with some nations.

monic introduces the pear-shaped bulge in the Northern Hemisphere).

Ionospheric Physics.—The existence of the hypothesized equatorial electrojet, a narrow electrical current in the equatorial ionosphere, was verified. Efficient radio wave propagation at 50 megacycles per second was noted in the Japan-Philippines area. Radio waves at 20 mc./sec. and 40 mc./sec. were noticed to focus at the antipode.

Latitude and Longitude.—Data analyses are still under way. The length of the baseline Washington–San Diego–Hawaii has been considerably refined.

Meteorology.—A significant accomplishment was the preparation of the first fairly complete weather maps for Antarctica. Monthly ozone patterns were found in the Antarctic long after the sun had set. A great continental-oceanic air exchange occurs along Antarctica, but with increased intensity during winter. High-altitude sounding balloons provided more information on stratospheric-tropospheric exchanges and stratospheric wind circulations. Explosive warming of the upper atmosphere was observed in the Arctic. (See also METEOROLOGY AND CLIMATOLOGY.)

Oceanography.—In addition to the known 12-hour, 24-hour, and 2-week tides, new tides having periods of 14 months and 18 years were found. Two great currents, the equatorial undercurrent and countercurrent, were mapped in the Pacific. The undercurrent is a large subsurface ocean current even larger than the Gulf Stream in volume. It flows eastward, is 3,500 miles long (disappearing near the Galapagos), 250 miles wide, and lies at a depth of between 100–800 feet. The research submarine *Sovevyanka* studied conditions in the Arctic, Atlantic, and other oceans. (See also OCEANOGRAPHY.)

Seismology.—Earth tides in some locations may move an entire area upwards 50–60 centimeters each 12 hours. Many detailed recordings with precision instruments permit a better understanding of the forces causing seismic activity. (See also SEISMOLOGY.)

Solar Activity.—Photographs of the sun in ultraviolet light were obtained from rockets. Photographs taken in Lyman-alpha radiation on March 13, 1959, showed the sun to be strikingly stormy. (See also ASTRONOMY.)

NATHANIEL C. GERSON,
Vice Chairman, Arctic Committee,
U.S. National Committee for the IGY.

INTERNATIONAL LABOR ORGANIZATION. In 1959 this specialized agency, associated with the United Nations since 1946, celebrated the 40th anniversary of its founding. The anniversary was celebrated in many countries of the world, and the United States set aside the period September 15–October 15 to commemorate the 40th anniversary of its membership in the ILO.

Membership in the ILO rose to 80 nations early in 1959 when the newly established Republic of Guinea joined the organization. That country and 74 other members sent tripartite delegations representing their governments, employers, and workers to the annual ILO Conference in June.

The 1959 ILO Conference adopted conventions providing for the minimum age of employment of fishermen and concerning the medical examination of fishermen and fishermen's articles of agreement. The conference also adopted a recommendation providing for the organization of health services in places of employment. Preliminary action was taken on a proposed draft convention dealing with the protection of workers against ionizing radiation.

General conference discussion centered on the tremendous problems of employment and unemployment described in the annual report of the director-general, David A. Morse. The problems of nonmanual workers, such as technicians and supervisory staff, were considered by the conference. It also adopted a budget of $9,300,909 to finance the activities of the ILO during 1960.

The ILO's broad technical assistance program had nearly 200 labor experts recruited from member countries at work in more than 60 countries during 1959. They advised governments on such matters as how to improve training of unskilled workers, conduct manpower surveys, increase productivity in industry and agriculture, and improve safety conditions.

The organization continued to assemble and distribute information on world labor and social conditions. Special meetings during the year dealt with the problems of drivers in highway transport, construction workers, coal miners, women workers, cooperatives in the Middle East, seafarers' welfare, statistics of industrial injuries, and certain aspects of industrial relations.

A special ILO survey team spent three months in the United States and in the Soviet Union making on-the-spot surveys of freedom of association.

RALPH WRIGHT,
Director, Washington (D.C.) Branch Office, ILO.

INTERNATIONAL LAW. International Court of Justice.—The United Nations Charter provides (Art. 93, par. 1) that: "All Members of the United Nations are *ipso facto* parties to the Statute of the International Court of Justice." Liechtenstein, San Marino, and Switzerland have also become parties to the statute although they are not United Nations members. Of these 85 states, 39 currently accept the compulsory jurisdiction of the court on the basis of declarations made pursuant to Article 36, paragraph 2, of the court's statute.

In 1959 (to November 1) the court rendered judgments in three cases: (1) *Interhandel,* Preliminary Objections, (Switzerland v. United States), March 21, 1959, *I.C.J. Reports 1959,* p. 6; (2) *Aerial Incident of July 27, 1955,* Preliminary Objections (Israel v. Bulgaria), May 26, 1959, *I.C.J. Reports 1959,* p. 127; and (3) *Sovereignty over Certain Frontier Land* (Belgium/Netherlands), June 20, 1959, *I.C.J. Reports 1959,* p. 209.

Only in the last case was the court able to decide the case on the merits. It held by a vote of 10 to 4 that the disputed land belonged to Belgium. In the *Interhandel* and *Aerial Incident* cases, the court upheld objections to its jurisdiction. In the *Aerial Incident* case, the court held by 12 to 4 that it lacked jurisdiction to adjudicate on Israel's complaint that Bulgaria was responsible under international law for the destruction of an Israeli aircraft over Bulgaria in 1955. The court held that the Bulgarian declaration of 1921 accepting without time limit the compulsory jurisdiction of the Permanent Court of International Justice had expired with the dissolution of that court and that Bulgaria had not accepted the compulsory jurisdiction of the new International Court of Justice. After this decision, the United Kingdom withdrew its parallel action against Bulgaria; but the United States continued its action against Bulgaria before the court in relation to United States nationals who died in the same plane incident.

The *Interhandel* judgment is interesting to students of international law, even though the court did not adjudicate specifically on the validity of the famous Connally Amendment reservation by which the United States, in accepting in 1946 the compulsory jurisdiction of the International Court of Justice, excluded "disputes with regard to matters which are essentially within the domestic jurisdiction of the United States of America *as determined by the United States.*" On the point of domestic jurisdiction the United States advanced two objections to the jurisdiction of the court to decide the case: first, that because the United States had determined under its Connally Amendment reservation that the sale or disposition of the General Aniline and Film Corp. shares which the United States had seized as enemy (German) property, although claimed by a Swiss company (Interhandel), was a matter essentially within its jurisdiction, the court lacked jurisdiction to consider even the Swiss claim that the issue was governed by treaties and other principles of international law;

and, secondly, that, according to international law, the seizure and retention of the shares by the United States was a matter falling within its domestic jurisdiction.

The court dealt first with the second contention, rejecting it by a vote of 14 to 1, and holding, in accordance with its established precedents, that if a dispute relates to a matter which, on a provisional view (that is, before deciding the merits), appears to be governed by principles of international law or treaties, it cannot, according to international law, fall within the domestic jurisdiction of one of the parties so as to exclude the jurisdiction of the court.

With regard to the determination made by the United States that the court lacked jurisdiction because the United States had so determined under its Connally Amendment reservation, the court held, by a vote of 10 to 5, that it was not necessary to adjudicate on the point. Because the United States had, in oral argument before the court, restricted the application of its "determination" of the court's jurisdiction and declared that it had lost practical significance in view of United States reliance on the failure of Interhandel to exhaust available remedies in United States courts, the court found the United States contention, as "thus presented," no bar to its jurisdiction to consider the admissibility of the Swiss claim. By a vote of 9 to 6, the court then held that the Swiss claim was inadmissible because Interhandel had not exhausted its remedies in United States courts.[1]

The significance of the court's judgment of March 21, 1959, in the *Interhandel* case has not been overlooked. On July 10, 1959, France withdrew her Connally Amendment reservation and deposited a new declaration accepting the compulsory jurisdiction of the court with reservations excluding, *inter alia,* "disputes relating to questions which by international law fall exclusively within the domestic jurisdiction," thus leaving it to the court to determine on the basis of international law whether or not a dispute arose out of a matter of domestic jurisdiction. On Sept. 14, 1959, India deposited a new declaration accepting the court's compulsory jurisdiction except, *inter alia,* for "disputes in regard to matters which are essentially within the jurisdiction of the Republic of India," thus abandoning the Connally Amendment reservation contained in her previous declaration of 1956. This leaves only the United States, Mexico, Liberia, Pakistan, Sudan, and the Union of South Africa with such peremptory reservations.

In the United States, a strong trend is developing for the withdrawal of the Connally Amendment reservation. The "self-judging" reservation has been criticized by the American Bar Association, the American Society of International Law, the Institut de Droit International, and many public officials, statesmen, and lawyers.

In a letter dated Nov. 17, 1959, to Senator Hubert H. Humphrey, President Eisenhower stated in part: "The administration supports elimination of the automatic reservation to the court's jurisdiction by which the United States has reserved to itself the right to determine unilaterally whether a subject of litigation lies essentially within domestic jurisdiction."

A relatively large number of cases were pending before the court in late 1959: *Aerial Incident of July 27, 1955* (United States v. Bulgaria); *King of Spain Arbitral Award of 1906* (Honduras v. Nicaragua); *Barcelona Traction Co.* (Belgium v. Spain); *Radio-Orient* (France v. Lebanon); *Temple of Preah Vihar* (Cambodia v. Thailand); and *Right of Passage over Indian Territory* (Portugal v. India). Also pending was a request by the Inter-Governmental Maritime Consultative Organization for an advisory opinion on a question arising out of certain implications of resort to "flags of convenience."

In October 1959, Ricardo J. Alfaro, a distinguished Panamanian international lawyer, was elected judge of the International Court of Justice to replace the late Judge José Gustavo Guerrero (El Salvador), who had been president of both the Permanent Court of International Justice and of the International Court of Justice.

Arbitration.—On Aug. 23, 1958, an arbitral tribunal composed of Georges Sauser-Hall, Swiss referee; Mahmoud Hassan (for Saudi Arabia); and Saba Habachy (for the Arabian American Oil Company) delivered an award in the case submitted to arbitration by Saudi Arabia and the company. The case, unusual in that one of the parties was a state and the other an oil company, was argued for both parties by distinguished international lawyers. The decision that the oil concession granted to Aramco by Saudi Arabia in 1933 established acquired rights which prevailed over a later contract (1954) between Saudi Arabia and Aristotle S. Onassis, purporting to grant the latter preferential treatment for transporting Aramco oil in Onassis tankers, was in part based upon the principles of international law. The arbitrator for Saudi Arabia dissented but signed the award against that state.

Treaties.—A total of 554 treaties and international agreements were registered or filed and recorded with the U.N. Secretariat during the year ending June 15, 1959, as compared with 718 in 1957–58. A total of 204 certified statements relating to treaties were registered in 1958–59. The total number of treaties thus registered or recorded with the United Nations from Dec. 14, 1946, to June 15, 1959, is 7,114, plus 1,671 certified statements relating thereto. This compares with a total of 4,831 treaties and international agreements registered or filed with the League of Nations over a 25-year period. The three-year accelerated program, initiated in 1957 and aimed at reducing to one year the interval between the registration of treaties and their publication in the *United Nations Treaty Series,* is proceeding on schedule with the publication of 89 volumes of the *Treaty Series* since June 1958. Volume 318 covers materials registered up to the end of 1958.

The number of treaties for which the United Nations acts as depository is 148. During the year 1958–59, a total of 125 new signatures and 164 instruments of ratification, accession, or notification in relation thereto were transmitted to the secretary general. Of such treaties newly entered into force, mention may be made of the Convention on the Nationality of Married Women, done at New York, Feb. 20, 1957, and entered into force Aug. 11, 1958; and the Convention on the Recognition and Enforcement of Foreign Arbitral Awards, done at New York, June 10, 1958, and entered into force, June 7, 1959. Three more states—Finland, Ghana, and Libya—have acceded to the Convention on the Privileges and Immunities of the United Nations, making a total of 61 parties, not including the United States, which have failed to accede.

At Washington, on Dec. 1, 1959, the representatives of 12 nations, including the United States and the Soviet Union, signed a treaty providing for "the use of Antarctica for peaceful purposes only" and the prohibition of all military activities in the area. (For details, see ANTARCTICA; for the full text of the treaty, consult *Department of State Bulletin,* Vol. XLI, No. 1069, Dec. 21, 1959, p. 914.).

In 1946 the U. S. Department of State consolidated the *Treaty Series* and *Executive Agreement Series* into the *Treaties and Other International Acts Series* (TIAS), which includes treaties and international agreements to which the United States is a party. The TIAS, commencing in 1946 with No. 1501, reached No. 4335 toward the end of 1959, indicating an average of about 200 treaties and agreements a year to which the United States is currently becoming bound.

International Law Commission.—The United Nations ILC held its 11th session at Geneva, April 20 to June 26, 1959. Owing to the absence for about half the session of the rapporteur on consular intercourse and immunities (Jaroslav Žourek of Czechoslovakia, who was serving as *ad hoc* judge for Bulgaria on the International Court of Justice during the Israel-Bulgaria plane dispute), the commission was unable to complete the scheduled draft on

[1] In individual opinions, Judges Sir Hersch Lauterpacht (United Kingdom) and Sir Percy Spender (Australia) regretted the unwillingness of the court to declare openly that the Connally Amendment reservation was invalid, incompatible with Article 36, paragraph 6 of the court's statute, and, because discretionary, incompatible with the assumption of a legal obligation accepting compulsory jurisdiction. They regarded the invalidity of the United States reservation as entailing the nullity of the United States declaration accepting compulsory jurisdiction, but were alone in expressing this view. President Helge Klaestad (Norway) and Judge Enrique C. Armand-Ugón (Uruguay) regarded the Connally Amendment reservation as invalid, but the declaration containing it valid.

consuls. The commission tentatively approved 19 articles of that draft and Articles 1–10 and 14–17 of its draft on *The Law of Treaties* (Sir Gerald Fitzmaurice, rapporteur).

The casual vacancy caused by the resignation of Abdullah el-Erian when Egypt and Syria became the United Arab Republic was filled by the commission in accordance with its statute by the election of Nihat Erim of Turkey. Faris el-Khouri, former Syrian member, is now the member from the United Arab Republic. A new vacancy on the commission results from the election of Ricardo J. Alfaro (Panama) to the International Court of Justice.

Professor of International Law,
Cornell University.

INTERNATIONAL MONETARY FUND. The Board of Governors of the International Monetary Fund (IMF), at its 14th annual meeting in Washington, D.C., Sept. 28–Oct. 2, 1959, accepted the annual report of the executive directors and considered other matters. The report stated that the year 1958 had been one of great advance in several important phases of the economy of the free world. Outstanding events were the sharp upswing of industrial production in the United States and renewed expansion in other industrial countries; the continuation of very substantial gold and foreign exchange reserves of western European countries; the move to external convertibility by 14 European countries and the complementary steps taken by 15 other countries; and the proposal made at the 13th annual meeting at New Delhi in October 1958, and the agreements subsequently reached, to expand the financial resources of the IMF. On the other hand, the experience of many of the primary-producing countries which had to deal with difficult problems during the year was much less satisfactory. But despite these difficulties, many of them took steps to introduce and carry out comprehensive stabilization programs.

During the 12 months ended Sept. 30, 1959, purchases of U.S. dollars, pounds sterling, and French francs were made by 10 members for equivalent amounts of their currencies. Totaling the equivalent of U.S.$139,853,542, these purchases were as follows: Argentina, $33,500,000; Bolivia, $250,000; Chile, $2,540,000; Haiti, $3,438,500; Honduras, $2,500,000; Mexico, $22,500,000; Nicaragua, $1,875,042; Peru, $14,500,000; Philippine Republic, $8,750,000; and Spain, $50,000,000.

The IMF agreed to stand-by arrangements, permitting drawings for periods of one year, with Argentina, $75,000,000; Honduras, $4,500,000; Pakistan, $25,000,000; and Spain, $25,000,000; and for periods of six months with El Salvador, $7,500,000, and Mexico, $90,000,000. Because of its improved position, Pakistan was able to cancel its stand-by arrangement three months before it was due to expire, without having made any drawings. One-year extensions of stand-by agreements were agreed to with Bolivia, $1,500,000; Haiti, $4,000,000; Peru, $13,000,000; Paraguay, $2,750,000; and the United Kingdom, $738,530,000. The stand-by agreement with Chile for $8,100,000 was extended on April 1, 1959, to the end of the year.

Total transactions between March 1, 1947, when the IMF commenced operations, and Sept. 30, 1959, were equivalent to $3,348,591,193. A total of 38 members have used the IMF's resources, some of them more than once. Of the total sales of currency by the IMF, $3,015,379,812, or about 90 per cent, has been in U.S. dollars.

During the 12-month period ended Sept. 30, 1959, repurchases of their currencies by member countries totaled a record $453,722,665, of which $50,070,387 was paid in gold and $403,652,278 in U.S. dollars. Repurchases were made by Australia, Brazil, Burma, Chile, Colombia, Denmark, Indonesia, Iran, Israel, Japan, Mexico, the Netherlands, Nicaragua, Paraguay, Philippine Republic, Turkey, Union of South Africa, United Arab Republic (Egypt), and the United Kingdom.

Initial par values were agreed with Ghana: 0.357143 Ghana pounds per U.S. dollar (Nov. 5, 1958); Spain: 60.00 pesetas per U.S. dollar (July 17, 1959); and Libya: 0.357143 Libyan pounds per U.S. dollar (Aug. 12, 1959). Of the 68 member countries of the IMF, 13 have not yet agreed on initial par values. On Dec. 29, 1958, with the concurrence of the fund, France established a new par value of 493.706 francs per U.S. dollar. (See also EXCHANGE RATES.)

The government of Argentina in December 1958 undertook a comprehensive stabilization program, including a reform of its exchange system, which formed the basis for a stand-by arrangement with the IMF, and was supported by additional financial assistance from the United States, and by credits provided by a group of private banks. The support of the IMF was requested by Mexico when it adopted budgetary and credit measures to strengthen confidence in its currency, and the resources made available by the IMF were augmented by credits from the Export-Import Bank of Washington (q.v.) and the U.S. Treasury. Spain in July 1959 undertook a comprehensive stabilization program which was supported by a stand-by arrangement and a drawing from the IMF, and by substantial credits from the Organization for European Economic Cooperation, the United States, and New York commercial banks.

During the year under review the IMF again carried out consultations with members on the retention of restrictions on payments and transfers for current international transactions. The *Tenth Annual Report on Exchange Restrictions* was published in June 1959.

Terms and conditions of membership in the IMF were approved by the Board of Governors for Laos and Portugal, with quotas of $7,500,000 and $60,000,000, respectively.

Pursuant to the resolution adopted in New Delhi in 1958 approving an increase in the resources of the IMF, by Sept. 15, 1959, the required minimum participation in the quota increase had been substantially exceeded. As a result, the fund's total resources are being increased from the equivalent of about $9 billion to about $15 billion.

FRANK A. SOUTHARD, JR.,
United State Executive Director.

INTERNATIONAL TRADE. World trade in 1959, after a slow start in the first quarter, moved rapidly upward from depressed 1958 levels. The total value of exports for the year was expected to equal, or fall very little short of, the record year 1957. Compared with the 1958 total of $96.1 billion, world exports were valued at annual rates of $93.0 billion, $101.9 billion, and $101.0 billion, respectively, in the first three quarters of 1959. Values for the April–September period reflected substantial gains over the preceding year in exports from Continental Europe and sterling area countries, and more moderate increases from the United States and Canada. (See Table 1 for detailed figures.)

As prices of commodities moving in world trade declined through the first half of 1959, the rising export values represented even larger increases in the actual volume of goods moving throughout the world. Compared with the like quarters of 1958, exports from industrial countries in 1959 showed an increase in volume of less than 2% in the first quarter, but they were over 11% greater in the second quarter. Shipments from the

Rest of world	8.4	8.6	8.2	8.7	8.1	9.0

Note: Data exclude trade of USSR, European Soviet satellites, and mainland China.

less-developed countries rose in volume by about 4% in the first quarter and 15% in the second. The latter increases reflected a renewal of demand from the industrial countries which are the primary users of the raw materials that form the major exports from less-developed countries.

The increase in demand was based on a general improvement in economic conditions in the major importing countries after nearly a year of recession or widespread stagnation in industrial production. United States manufacturing activity rose from a low of 128 in April 1958 (based on the Federal Reserve Board's seasonally adjusted index) to 158 in June 1959; Canadian factory production in the second quarter of 1959 surpassed that of any previous quarter; and European manufacturing output in June exceeded by 4% its previous record monthly total.

Prices of most classes of goods moving in international trade dropped in the first half of 1959 below levels for the previous several years. Primary commodities, including food, coffee and tea, textile fibers, and minerals, were the lowest in price for a decade. Prices of manufactured goods also fell off in 1959, but remained on the average well above levels for all recent years, excepting 1957 and 1958. Only prices of nonferrous base metals as a group turned upward, after sharp declines in prices beginning in mid-1957 and continuing through the third quarter of 1958.

The general improvement in economic conditions in many areas of the world was reflected in rapid liberalization of trade from controls against dollar imports. Nearly all European countries took major steps in the course of 1959 to eliminate discrimination of this kind. The lead of the United Kingdom in this respect was widely followed both by independent sterling countries and by British colonial territories. Japan abolished the distinction between dollar and sterling in her foreign exchange budget, and increased the list of items automatically approved for import on a global basis. Many Latin American countries, on the other hand, feeling an economic pinch because of reduced prices for exports, tended to intensify controls. These, however, were not discriminatory against dollar goods.

The European liberalization of trade controls followed the continued improvement in foreign exchange reserves in 1958 which continued into 1959. This accumulation had led the major countries of Europe to take an important step at the end of December 1958 toward convertibility of their currencies. The improvement in reserves in turn was largely based on a high—though not a rising—level of exports in 1958, coupled with a level of imports about $2.5 billion lower than in 1957. The year 1959 brought substantial gains in European export sales, with only moderate increases in imports. Although in the first quarter of 1959, shipments were little higher than in the like quarter of 1958, the second and third quarters averaged nearly $3.5 billion more at an annual rate than in the same quarters of 1958. Leading in these export gains were France, West Germany, the Netherlands, and Belgium. Imports rose by only about $1 billion at an annual rate in January–September 1959, compared with January–September 1958.

Of particular interest to the international trading community in 1959 was the formation of a second European trade group similar to that established in 1958 under the name of the European Economic Community (q.v.). The convention for this new group, the European Free Trade Association (q.v.), was initialed in Stockholm on Nov. 20, 1959, by Austria, Denmark, Norway, Portugal, Sweden, Switzerland, and the United Kingdom (the so-called Outer Seven). These countries agreed to cut tariffs among themselves progressively until they are abolished by 1970; the first reduction of 20% will be applied on July 1, 1960. It was further agreed that quantitative import restrictions would be relaxed gradually until their abolition by the end of 1969. Portugal, because of its less-developed industrial status, was given until 1980, if it so wished, to complete the abolition of its duties. The difficult problem of duties on agricultural commodities was sidestepped for the present by excluding them from the plan for general tariff reductions. The preamble to the convention indicated that the association was being established in order to bring into being a multilateral organization embracing the 17 countries of the Organization for European Economic Cooperation (OEEC). A plan for such an association failed to receive agreement late in 1958, after prolonged negotiation.

On Jan. 1, 1959, the European Economic Community (EEC), also called the Common Market, took its first steps toward the establishment of a free trade area by the six member countries, according to a previously agreed schedule. Import tariffs among the participating countries—Belgium, Luxembourg, France, Germany, Italy, and the Netherlands—were reduced by 10%. Bilateral import quotas were converted into global quotas open to all member countries and were increased by at least 20% in value. Members of the Common Market took the further step of extending to the

other 11 countries of the OEEC and to all other participants in the General Agreement on Tariffs and Trade the same 10% reduction in import tariffs, provided the tariffs were higher than the EEC common external tariff. A part of the expanded quota was also made available to other European countries. (See also TARIFFS.)

Two other trade associations of countries began to take shape during 1959 in Central and South America (see below, *Latin America*).

United States.—The value of nonmilitary exports from the United States in the first eight months of 1959 totaled $10.6 billion, a slight decrease from $10.9 billion in the same period of 1958 and well below the record export value of $13.3 billion for the comparable months of 1957. Imports, on the other hand, reached a new high of $9.9 billion in the first two thirds of 1959, showing one of their sharpest rises on record. The resultant trade surplus was only $700 million, contrasted with that for January–August 1957 of $4,700 million. It should be remembered, however, that exports in 1957 were the highest ever recorded, the result of many special situations, while imports were well below 1959 levels. The net export balance in 1959 was the lowest recorded in any year since World War II.

Foreign transactions of the United States recorded in the balance of payments (seasonally adjusted) resulted in increases in the gold and dollar assets of foreign countries of about $900 million in the first quarter of 1959 and just under $1,000 million in the second quarter. This continued the accumulation of reserves by foreign countries which had been under way since the autumn of 1957. The increase in foreign gold and dollar assets acquired through transactions with the United States amounted to $1.5 billion in the first half of 1958 and $1.9 billion in the second half.

United States receipts in the first half of 1959 were only fractionally less than in the comparable half of 1958, as declines in exports were nearly balanced by small increases in foreign purchases of American stocks and other long-term investments. Total United States payments increased slightly, for substantial increases in payments for merchandise imports were countered by reductions in government and private capital outflows. The latter reflected largely the continued advance in interest rates in the United States, both absolutely and in relation to European rates.

Table 2—PRINCIPAL COMMODITY EXPORTS AND IMPORTS OF THE UNITED STATES, 1958 AND JANUARY–AUGUST 1959
(Millions of dollars)

Commodity	Year 1958	January–August 1959
Domestic exports, total	15,626	10,102
Wheat and wheat flour	685	505
Coarse grains	465	367
Cotton, raw	656	209
Textile manufactures	600	392
Wood and paper	450	317
Coal	526	256
Petroleum and products	462	273
Iron and steel-mill products	563	296
Metal manufactures	480	295
Electrical apparatus	794	498
Construction, excavating, and mining machinery	695	465
Other industrial machinery	1,567	1,005
Tractors, parts, and accessories	311	243
Commercial-type trucks	294	225
Chemical specialties	517	393
All other merchandise	6,561	4,363
Imports for consumption, total	12,781	9,740
Meat products	337	270
Coffee	1,172	707
Sugar, cane	522	378
Rubber, crude	248	239
Textile semi- and finished manufactures	637	540
Sawmill products	264	232
Woodpulp	278	209
Newsprint	615	422
Petroleum, crude	943	577
Residual fuel oil	459	310
Iron and steel-mill products	231	326
Nonferrous ores and metals	1,023	715
Automobiles, except trucks	489	493
Chemicals and related products	282	226
All other merchandise	5,281	4,096

Note: Commodity export data exclude "special category" exports, which are restricted for security reasons, totaling $2,068 million in 1958 and $1,225 million in January–August 1959.

The year 1959 marked a turning point for United States exports, which, after being in a depressed state from the end of 1957 through the first two months of 1959, began to show signs of recovery in March and rose substantially in the months following. Had it not been for the prolonged steel strike, which affected exports of steel and of many industrial products dependent on steel supplies, total exports would undoubtedly have risen much higher. Compared with the first eight months of 1958, exports in January–August 1959 of the following major commodities registered gains of 10% or more: meat products, wheat and wheat flour, coarse grains, synthetic rubber, soybeans, iron and steel scrap, agricultural implements, automobile parts for assembly, chemical specialties, and industrial chemicals. There were large declines in the exports of certain commodities. Shipments of raw cotton, for which new lower world prices were to take effect late in the year, dropped from $517 million in January–August 1958 to $209 million in January–August 1959. Coal exports fell from $359 million to $256 million in the same months. Iron and steel-mill products declined by $86 million, while industrial machinery exports dropped from $1,550 million to $1,470 million.

The expansion in imports stemmed from two distinct demands within the United States. One was the recovery in demand for crude and semiprocessed materials from abroad. Such requirements had declined during the 1957–58 recession when industrial production fell and business inventory investment was reduced. Among the many commodities involved in this upswing in imports were rubber, wool, industrial diamonds, and wood and paper products. The second demand resulted from the continued expansion in purchases of foreign manufactured goods. Noteworthy increases were recorded for imports of semifabricated and finished steel, as a result of the expected steel strike, and of automobiles, textile manufactures, and a wide range of miscellaneous consumer products.

The revival of United States exports after February 1959 reflected to a considerable degree the general improvement in economic conditions in certain major markets, notably Canada, Europe, and Japan. In the first eight months, shipments to Canada were about 8% above the depressed level of comparable months in 1958. Many exports to western Europe, including food, synthetic textile fibers and manufactures, machinery, and chemicals, showed gains, but sharp losses were recorded in exports of aircraft, steel, coal, and cotton. United States exports to the Latin American market, which remained in a depressed condition, were lower by $400 million than in 1958.

With the exception of the Middle East and Africa, imports from all areas reported increases. Principal among these was western Europe, from which the United States purchased over $800 million more in the first eight months of 1959 than in the corresponding period of 1958. An increase of more than $400 million was recorded for the Far East, while purchases from Canada rose by $200 million and those from Latin America, by $50 million. (For detailed figures on United States trade

by commodity and by country, see Tables 2 and 3.)

Canada.—Canadian imports in the first three quarters of 1959 totaled Canadian $4.1 billion, or 11% above the corresponding period of 1958. In the same period, total exports rose by 3%, reaching a value of C$3.6 billion. The deficit on trade account increased from C$200 million in the 1958 period to C$500 million in 1959. This net figure was accounted for by a C$570 million deficit with the United States, a C$150 million surplus with the entire Commonwealth area, and a C$80 million deficit with the rest of the world. As compared with 1958, the increase in Canada's trade deficit was accounted for by an expansion of imports from the United Kingdom, the Comonwealth area, and the rest of the world, while exports to these countries either remained steady or fell. Rises in imports from the United States were almost equaled by increased exports.

In the first six months of 1959, Canada's balance of payments deficit on current account was C$837 million, a 40% increase over the first half of 1958. Most of the increased deficit was in trade, but the account deficit "invisibles" also rose slightly, to reach C$482 million. The largest invisible item represented dividend and interest payments to nonresident individuals and companies, 60–70% of which were American. These dividend payments have been rising each year as investment by Americans and other foreign nationals continues to mount in Canadian oil, mining, and other industries. Contrasting sharply with January–June 1958, when long-term capital inflows completely covered the deficit on current account, in January–June 1959 only two thirds of the shortfall was met in this way.

The mild increase in Canadian exports in the first nine months of 1959 was concentrated primarily in two or three categories of goods—iron, nonmetallic minerals, and wood. In the first category, iron ore and farm machinery showed the only substantial gains; asbestos, artificial abrasives, and other stone products figured largely in the second; and planks and boards, woodpulp, and newsprint were the major items showing increases in the wood group.

All classes of imports joined in the sizable total expansion. Most gains, however, were small, with the exception of iron products where almost two thirds of the total increase from January–July 1958 to January–July 1959 took place. The principal rises were in farm implements and machinery, automobiles and parts, rolling mill products, and business machinery.

Canada's total imports in January–July 1959 from the United States rose by C$190 million, to almost C$2.3 billion, or 69% of Canadian imports; and those from the United Kingdom, the second most important source of supply, increased from C$315 million to C$336 million, or 7%. Canada's close economic ties with the United States were also evidenced by her export trade, 62% of which was with her southern neighbor in the first nine months of 1959. Exports both to Europe and to Latin America fell off during 1959. (For details of Canada's commodity trade, see Table 4.)

Latin America.—Through the first half of 1959 the combined value of exports of the 20 Latin American republics was $8.1 billion at an annual rate, or almost the same as the export value in 1958 but lower by $600 million than the 1957 level. Reduced prices received in international markets for principal Latin American exports —petroleum, lead, nitrates, and especially coffee, sugar, and bananas—together with increased volume in many cases, were largely responsible for the steady export income, compared with the previous year. Total imports of the area for January–June 1959 were estimated to be $7.5 billion at an annual rate, compared with $8.5 billion in 1958 and $9.3 billion in 1957. Imports of most Latin American countries were restricted for balance-of-payments reasons.

All major Latin American countries, with the exceptions of Brazil and Colombia, reported reduced imports in the first half of 1959 as compared with the same months of 1958. Brazil continued to encounter severe balance-of-payments difficulties, brought about by a combination of substantially lower income from coffee (which accounts for about 75% of export earnings) and rising imports to meet the needs of a program of rapid industrialization. Other countries in the area, notably Argentina, Chile, Colombia, and Peru, all of which faced difficult economic situations in 1958, were able to be cautiously optimistic by mid-1959, as deficits were reduced by strict limitations on imports and the downward movement of prices for several key export commodities was reversed. The export earnings of all principal Latin American countries, except Mexico, declined to some extent in the first half of 1959 as compared with the same half of 1958, although several were able to report improvement in second-quarter values over those for the first quarter. (See Table 5 for comparative values of Latin American exports and imports.)

A number of significant moves designed to help improve their economic situations were taken by various groups of Latin American countries during 1959. In September an international coffee agreement was signed by countries accounting for 85% of world production, including all Latin American producers. In an effort to maintain orderly marketing and to establish a more favorable world price in view of surplus supplies, the signatory nations agreed to limit their exports to fixed quotas for the coffee season beginning October 1, to levels representing approximately 90% of their best export totals in the last 10 years.

The Multilateral Treaty of Free Trade and Central American Economic Integration, signed by five Central American countries on June 10, 1958, went into effect for El Salvador, Nicaragua, and Guatemala on June 2, 1959. The aim of the treaty was the establishment of a customs union wherein all trade would move between these three nations and Honduras and Costa Rica without restriction at the end of a 10-year period. The treaty provided for immediate free trade in some 200 items. Further agreements reached included a Central American Convention on Equalization of Import Duties, whereby a common customs tariff must be adopted within five years. Although many details of these and related agreements remained to be worked out, steps taken in 1959, which were the culmination of a long period of study, signified substantial progress toward the goal of Central American trade integration.

[1] Includes estimates for countries listed separately for which data are not available. [2] Not available.

Seven countries of South America tentatively approved in September a free trade treaty which would provide for a free trade zone to be gradually perfected between them within a 12-year period. The contracting parties—Argentina, Boliva, Brazil, Chile, Paraguay, Peru, and Uruguay—proposed to eliminate gradually duties on imports originating in the zone. Final approval of the plan by these countries was scheduled to be given in February 1960.

United Kingdom.—British trade, after a slow start in the first quarter, and following a year at lowered levels, recovered strongly in the second quarter of 1959. Total exports for January–September were valued at £2,520 million, and imports at £2,908 million. These figures represented increases in British commodity trade of 3 and 5% respectively, compared with the like periods in 1958. In the six months following the pickup of trade in April, there was a 6% increase registered in exports. Export prices generally remained stable in 1959, but average import prices, which had declined in 1958, dropped somewhat further so that there was an increase of about 7% in the volume of imports over that for 1958.

In the first half of 1959 the United Kingdom showed a balance of payments surplus of £142 million, £95 million lower than in January–June 1958. This change was almost entirely due to the rise in imports of both goods and services. Exports of goods and services combined showed no change, compared to the previous year, while net income from abroad less net transfer payments was only £1 million lower. Britain's gold and foreign exchange holdings amounted to £1,080 million at the end of October, or slightly lower than at the end of October 1958, mainly because the British government repaid in full in October—well in advance of the due dates—a $250 million loan floated in October 1957 by the Export-Import Bank of Washington. In March the government repurchased $200 million of $561 million drawn from the International Monetary Fund in December 1956. These actions were made possible by the favorable financial position of the United Kingdom and by the continued strength of the pound sterling.

Other foreign countries	554	450	541	421

A series of actions relating to British imports also reflected this improved position. On November 9 most of the remaining controls on imports of goods from the dollar area were abolished. This step followed sweeping reductions made earlier in the summer and in 1958 when more than three fourths of British imports from the United States and Canada were removed from the restricted list. These controls, which had originally been imposed at the outbreak of World War II, had been maintained for balance-of-payments reasons until 1959.

Of the total increase in imports registered through the first nine months of 1959, those from other sterling countries rose by 6%, while imports from the rest of the world also gained, but by a lesser amount. About half of the latter rise was in imports from western Europe. Gains were also recorded in petroleum imports from Latin America and in imports, particularly of timber and furs from eastern Europe. Rises were noteworthy in fuels and in manufactured goods, imports of which increased by £35 million and £87 million respectively in the first nine months of 1959, as compared with the same months of 1958. The largest increases occurred in crude petroleum, copper and other nonferrous base metals, nonelectric machinery, chemicals, and miscellaneous manufactured consumer articles. There were also some important declines, notably in values of imports of iron and steel, iron ore, nickel, raw cotton, crude rubber, live animals, fruits and vegetables, and tea.

Exports from Britain did not show as much buoyancy as imports in 1959, although there were major gains in some key commodities. Engineering products contributed most to the rise. Of especial importance in this group were machinery and automobiles; exports of chemicals, tin, and iron ore also advanced significantly in value. Manufactures of woolen and worsted manufactures increased substantially in volume, but not in value because of lowered prices.

Exports to the sterling area, which had dropped markedly in 1958 from earlier levels, began to recover in the second quarter of 1959, although they remained below 1958 values. Reduced sales to these countries reflected their generally reduced purchasing power, occasioned by lower prices received for their primary products. Exports to nonsterling countries rose above 1958 levels, especially those to North America where a 25% increase was recorded. For example, the value of motor cars exported to the United States rose from £45 million in January–September 1958 to £68 million in January–September 1959, while those to Canada increased from £14 million to £23 million. (Table 6 shows British trade with principal countries.)

(See also articles on the countries named herein, and the Index entry, *International Trade.*)

FRANCES L. HALL,
Chief, Foreign Trade Section, International Economic Analysis Division, Bureau of Foreign Commerce, U.S. Department of Commerce

INTERSTATE COMMERCE COMMISSION. The Interstate Commerce Commission (ICC) is composed of 11 members appointed by the president for seven-year terms. Commissioner Kenneth H. Tuggle was elected chairman on Jan. 1, 1959.

The transportation industry regulated by the ICC was recovering in the fiscal year 1959 from the general economic recession of the previous fiscal year. Operating revenues of the carriers were estimated at $19.4 billion for the year ended June 30, 1959, or 5.6% greater than in the preceding 12-month period.

Railroad revenues were estimated at $10.4 million, an increase of 2.1% compared with the previous year. However, the mounting deficit resulting from operation of rail passenger service was the subject of an exhaustive commission study. The cost of such service for 1958 is estimated to have exceeded passenger revenues by nearly $610 million. Suburban and commuter rail service continued to present an increasingly serious problem and was the subject of study and investigation by Congress.

Ten applications for federally guaranteed railroad loans provided by the newly enacted Trans-

portation Act of 1958 were received for a total of $78.3 million, of which one for $450,000 was withdrawn, two covering $3.9 million were granted, and two for $9.9 million were tentatively approved. During the fiscal year permission was sought to abandon 1,203 miles of track, compared with 2,062 miles in the preceding year. The commission received requests for authority to construct trackage totaling 136 miles.

The Transportation Act of 1958 contained provisions whereby the railroads could submit to the ICC proposals to curtail or discontinue passenger service, a matter formerly under the jurisdiction of state commissions. The discontinuance of two ferry services and 26 trains was approved prior to June 30, 1959. A number of mergers were considered by railroads seeking solutions for financial problems, but only one major agreement was submitted formally to the ICC for approval during the year ended June 30, 1959. (See also RAILROADS.)

Intercity bus traffic continued to be adversely affected by the growing use of private automobiles for intercity travel, but revenues were higher than those of the previous fiscal year. Improved vehicles, facilities, and service are being introduced to combat the trend. For the 12 months ended June 30, 1959, revenues of ICC-regulated motor carriers of freight reached an all-time high point, about 12% above the previous year, reflecting the improvement in general economic conditions. Repeal of the 3% excise tax on freight is considered responsible in part for this improvement. (See also MOTOR TRANSPORTATION.)

Revenues of intercoastal and inland carriers by water were about 8% higher in the 12 months ended June 1959 than in the preceding 12 months. Traffic offered the St. Lawrence Seaway (q.v.) after its opening was greater than anticipated, causing railroads serving Eastern ports to reduce rates to meet this competition. (See also INLAND WATERWAYS.)

Pipeline mileage subject to ICC jurisdiction, which excludes natural gas and water lines, decreased slightly in 1958, but revenues were 7% higher in fiscal 1959.

The use of containers to eliminate expensive hand-transfer of freight is growing in importance. Emphasis is on containers detachable from highway truck trailer chassis to save weight and space, particularly on the part of carriers by water. Trailer-on-flat-car (piggyback) service continues to expand geographically; such carloadings were 11% higher in 1958 than in 1957.

The ICC continued to conduct an active safety program which, among other things, included the investigation and issuance of reports of the more serious rail and motor accidents. More than 60,000 motor carrier vehicles were inspected during nationwide road checks in the fiscal year 1959.

KENNETH H. TUGGLE,
Chairman, Interstate Commerce Commission.

Des Moines (*capital*)	212,610	Sioux City	85,755
Dubuque	59,128	Waterloo	82,010
Fort Dodge	27,921		

Executive.—Chief state officers in 1959:
Governor: Herschel C. Loveless (Democrat)
Lieutenant Governor: Edward J. McManus
Secretary of State: Melvin D. Synhorst
Treasurer: M. L. Abrahamson
Attorney General: Norman A. Erbe
Auditor: C. B. Akers
Supt. of Public Instruction: J. C. Wright

Constitution and Judiciary.—The present constitution, which went into effect in 1857, has been amended 21 times. The Supreme Court comprises 9 justices, all popularly elected for six-year terms. Chief justice in 1959 was Robert Larson.

Legislature.—The Iowa General Assembly comprises a 50-member Senate (in 1959, 33 Republicans, 17 Democrats) and a 108-member House of Representatives (58 Republicans, 50 Democrats), which meet in odd-numbered years commencing the second Monday in January.

The 58th Iowa General Assembly met in regular session from January 5 until May 3. A total of 428 laws were enacted, with consideration having been given to 1,314 bills introduced in both houses. At least ten bills that would have reapportioned the General Assembly were introduced but failed to get a constitutional majority necessary in both houses before formal proposal as a constitutional amendment. The record-high budget recommended by Democratic Gov. H. C. Loveless was modified by the Republican majority in the legislature but still emerged basically as proposed by the governor. No major tax rises were effected, although the cigarette tax was raised from 3 to 4 cents a package and the corporation income tax from 2% to 3%. The assembly rejected proposals to increase the general sales tax and income taxes.

With respect to other matters the legislature made members of the Iowa Commerce Commission appointive rather than popularly elective; took no action concerning the controversial right-to-work law which had been enacted in 1947; held state aid for public school districts to the 1957–59 level of approximately 12% of total district school costs; and gave initial approval to a constitutional amendment which would make the judges of the state Supreme Court and district courts appointive rather than elective.

In other measures the legislature established new speed limits for all highways; increased the size of the highway patrol; approved four-year, instead of two-year, terms for most county officers; and guaranteed the right of an arrested person to at least one telephone call to contact his lawyer.

Finance.—In the 1958–59 fiscal year, state revenue of $546,233,158.62 comprised $210,719,114.50 from state tax sources, $112,263,358.68 from the federal government, and $223,250,685.44 from other sources. Tax revenue consisted of $66,430,262.33 from a 2% general sales tax, $35,779,696.62 from individual income taxes, $2,634,973.57 from corporate income taxes, $69,219,201.77 from motor

fuel taxes, $8,199,027.03 from licensing, and $28,455,953.18 from other sources. Expenditures of $510,089,596.96 comprised $64,985,706 for education, $22,574,701 for health, welfare, and safety, $136,424,649.75 for highways, and $286,104,540.21 for other purposes. State long-term indebtedness on June 30, 1959, amounted to $40,900,000.

Banking.—As of March 12, 1959, there were 97 national banks in Iowa with deposits of $968,524,000 and resources of $1,064,829,000. There were also 565 state banks, 163 bank offices, 301 small loan licensees, and 332 credit unions under supervision of the state banking department. Total assets of the state banks as of July 1, 1959, were $2,226,262,196; total deposits were $2,010,678,372.

Education.—School attendance is compulsory between the ages of 7 and 16, inclusive. Operating expenditures in 1959–60 for public elementary and secondary schools were derived as follows: 88% from local school districts, 11% from state grants, and 1% from federal funds. Classroom teachers' salaries averaged $4,311.

In the 1959–60 school year, the state's 27,237 public school teachers instructed 417,519 pupils in elementary schools and 136,704 pupils in secondary schools. Private and parochial elementary and secondary pupils numbered 83,204. There were 16 public junior colleges with 2,932 students, 21 private colleges with 24,562 students, and 3 state colleges and universities with 23,324 students. Instructors in institutions of higher education numbered 2,225.

Social Welfare.—The 1959–60 fiscal year appropriations for social welfare totaled $18,335,000, as compared with $17,385,000 for the previous fiscal year. Contributions to the state unemployment fund as of June 30, 1959, were up to $9,488,510 from $8,528,757 for 1958. For the 1958–59 fiscal year, benefit payments totaled $9,077,289, and the reserve fund amounted to $113,665,427. The state spent $48,547,000 for public assistance and $24,506,000 for public health services and hospitals.

Labor Force.—The state's labor force totaled 1,176,000 in July 1959, including 368,000 agricultural workers. Nonagricultural employment numbered 784,900, compared with 757,000 a year earlier and an average of 767,550 for the 12 intervening months. Of nonfarm employees, 27% were engaged in manufacturing, 25% in trade, and 16% in government. Unemployment in July 1959 was down to 23,100 from 36,200 a year earlier.

Manufacturing.—In 1959 the 3,466 manufacturing plants in the state employed 184,000 persons who received average weekly wages of $86.57 and worked an average of 40 hours weekly in June. Value added by manufacture (1957) totaled $1,561,709,000, and outlays for new plant and equipment amounted to $110,561,000.

MAJOR IOWA MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.* (thousands of dollars)
Food and kindred products	51,722	$239,827	$471,228
Nonelectrical machinery	34,887	189,598	344,112
Chemicals and products	6,417	30,137	107,439
Printing and publishing	12,519	51,258	101,372
Primary metal industries	6,115	30,157	75,191
Electrical machinery	9,351	39,875	66,915
Fabricated metal products	6,641	32,369	65,948
Stone, clay, glass products	5,096	21,885	63,025
Rubber products	4,086	22,475	52,737

* For definition see text footnote 1 in the article *Industrial Production.* (Source: *Annual Survey of Manufactures: 1957.*)

Mining.—The value of Iowa's mineral output has increased steadily since 1953. The 1958 value was over $85 million, or 24% above that of the previous year, accounting for 0.52% of the national total and ranking Iowa 29th among the states. The principal mineral products of Iowa are building materials, production of which was stimulated in 1958 by increased highway construction. In marked contrast to the steady output growth of other minerals, bituminous coal mining was 10% less in 1958 than in 1957, continuing a decline of many years. Iowa ranked fourth nationally in 1958 production of gypsum and eighth in cement.

IOWA MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Cement (bbl.)	12,675,000	$41,741,000
Coal	1,179,000	4,147,000
Gypsum	1,230,000	4,491,000
Sand and gravel	12,411,000	10,965,000
Stone	21,045,000	26,138,000
Other minerals	...	1,687,000
Total	...	85,356,000*

* Total adjusted to avoid duplication in the value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—The size of the average Iowa farm is increasing while the number of farms is decreasing. In 1958 there were 186,923 farms, compared with 193,000 in 1954. Total acreage was 34,631,364, with an average of 185 acres per farm. Livestock on farms (Jan. 1, 1959) included 6,536,000 cattle, 12,533,000 hogs, 1,132,000 sheep, and 28,565,000 chickens (excluding commercial broilers). During the week of Nov. 22–29, 1959, 281,000 family and hired workers were engaged in farming.

Cash farm income for the first nine months of 1959 was down slightly to $1,739,773,000 from $1,846,023,000 for the same period of 1958. For the full year 1958, income comprised $2,080,465,000 from livestock and livestock products, $479,534,000 from crops, and $59,429,000 from government payments. Total 1958 cash income was more than $366,494,000 higher than in 1957. Principal income sources in 1958 were: cattle, $902,600,000; hogs, $808,332,000; corn, $230,733,000; and soybeans, $170,205,000.

IOWA CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Corn (1,000 bu.)	566,066	664,290	830,346
Flaxseed (1,000 bu.)	650	259	278
Hay (1,000 tons)	6,384	8,304	7,699
Oats (1,000 bu.)	219,274	219,401	186,490
Popcorn (1,000 lb.)	42,623	94,000	37,600
Potatoes (1,000 cwt.)	598*	540	495
Sorghum grain (1,000 bu.)	1,759	13,695	3,685
Soybeans (1,000 bu.)	44,343	79,458	63,441
Wheat (1,000 bu.)	3,961	4,816	2,899

Transportation and Communications.—Total state and federal funds spent for highways in 1958 amounted to $231,688,758, and 4,487 miles of new construction were completed.

Highways and roads on Jan. 1, 1959, totaled 111,683 miles (98,941 surfaced), and registered *motor vehicles* numbered 1,232,286 on Dec. 1, 1958, including 998,410 passenger cars. There were (1958) 11 Class I and 12 other *railroads* operating 8,367 line miles; and (1959) 4 regularly scheduled *airlines* and 187 *airports and airfields* (75 municipal, 3 military-municipal, and 109 commercial and private).

Communications media (1959) included 63 AM and 10 FM *radio stations;* 12 VHF *television stations;* 43 daily *newspapers* (1957 circulation, 923,313) and 394 other newspapers; and (January 1) 219,400 business and 821,700 residential *telephones.*

Principal Events, 1959.—The major issue confronting the 58th Iowa General Assembly (see above, *Legislature*) was that of reapportionment. Since the legislature was last apportioned in 1904, the increase in population and the shift from rural to urban living has caused many areas to be underrepresented, while rural areas are overrepresented. More than 12 plans for reapportionment were considered, but no constitutional amendment was passed by both houses, in spite of recommen-

dations by the governor's nonpartisan study committee. A citizens' committee was formed in 1959 to urge voters to support in 1960 the proposition that is presented to the voters every 10 years: "Shall there be a constitutional convention to rewrite the constitution?" The highest budget in the history of the state was proposed by Democratic Governor Loveless and was passed with minor changes by the Republican-controlled legislature.

In 1959 the number of students in both elementary and secondary schools, as well as in higher educational institutions, reached an all-time high. Appropriations for the three state-maintained institutions of higher learning also reached new highs.

Iowa was the center of national attention on September 22–23, when Soviet Premier Nikita Khrushchev visited Des Moines, the Roswell Garst farm near Coon Rapids, and the campus of Iowa State University in Ames.

The State University of Iowa's football team, which won the Big Ten title in 1958, defeated the University of California in the Rose Bowl on Jan. 1, 1959. The Rose Bowl victory was the second in three years for the Hawkeyes.

Stephen Carter, Iowa's U.S. representative from the 4th District, one of four Iowa Democrats in Congress, died on November 4. Republican John Kyl of Bloomington won a special election on December 15 to fill the vacancy. Kyl captured 12 of the district's 14 counties in unusually heavy voting.

In other developments of 1959, the corn crop was the largest in Iowa's history; the state Treasury was in excellent condition, with an unencumbered balance of nearly $50 million; 70 more deaths occurred on Iowa highways in the first 10 months of the year than in the corresponding period of 1958; and rainfall during 1959 was the heaviest in recent years, totaling more than 45 inches in many sections of the state.

RUSSELL M. ROSS,
Associate Professor of Political Science, State University of Iowa.

IRAN. Iran is a constitutional monarchy in southwestern Asia, bounded on the north by the Soviet Union and the Caspian Sea, on the east by the Gulf of Oman and the Persian Gulf, and on the west by Iraq and Turkey. Its area is estimated at over 629,000 square miles. At the 1956 census the population of the country was 18,944,821 (est. 1959, 20,300,000); of the principal cities: Teheran (Tehran), the capital, 1,513,164; Tabriz, 290,195; Isfahan, 254,876; Meshed, 242,165; Abadan, 226,103; Shiraz, 169,088; Kermanshah, 125,181; Ahwaz, 119,828; Resht, 109,493; and Hamadan, 100,029.

Living Conditions.—The majority of the people are Shi'ite Moslems of the Iranian language group; Persianized Turkic elements, comprising about one fourth of the population, are found in the north and northwest. About 2 million nomadic and seminomadic tribesmen, including Lurs, Kurds, Bakhtiaris, Qashqais, Turkomans, Baluchi, Mamassani, Arabs, Shahsavan, and others, move seasonally between hot lowlands and cool mountain valleys.

Approximately 13 million farmers live in some 46,000 small villages, 2 million persons live in villages and towns of between 5,000 and 100,000 inhabitants, and 3.3 million live in cities of over 100,000. The majority of the farmers are sharecroppers, although the sale of crown and state lands is increasing the number of peasant landowners. Measures to improve the health and education of the villagers have been undertaken, and in some 300 towns and villages work is under way to pave streets, install electric light plants, and provide water supply systems.

Government.—Executive power rests with the shah (Mohammed Riza Pahlavi; acceded Sept. 16, 1941) and the Council of Ministers, which is responsible to Parliament. The lower house, or Majlis, consists of 200 deputies elected every four years; the 19th Majlis convened in May 1956 and the 20th Majlis will be elected in the summer of 1960. The Senate, consisting of 60 members (30 appointed by the shah and 30 elected in two stages) serving six-year terms, came into existence in 1950. Dr. Manuchehr Eqbal has been prime minister since April 3, 1957.

WIDE WORLD

The shah of Iran and his bride, 21-year-old Farah Diba, after their wedding in the palace at Teheran, December 21. His two earlier marriages failed to produce a male heir.

In general, national elections have been dominated by the established interests of the monarchy, army, large landowners, and tribal leaders. However, two political parties are now active. The Mellioun (Nation) Party, founded in 1958, is headed by prime minister Eqbal, and the Mardom (People's) Party, led by Asadollah Alam, is the loyal opposition party which supports the foreign policy of the government but urges the interests of peasants, workers, and women. These parties will contest the 1960 elections, with a new prime minister to be chosen from the ranks of the winner. Independent candidates will also contest seats in the Majlis.

Education.—Although primary education is compulsory by law, many sections still lack schools, and the majority of the population is illiterate. In 1958 there were 7,750 primary schools with 1,020,703 pupils and 963 secondary schools with 190,113 students. In 1959, universities and colleges at Teheran, Tabriz, Meshed, Shiraz, Isfahan, and Ahwaz had 14,000 students.

Religion.—Some 93% of the population subscribes to the official religion, the Ithna 'Ashariyah Shi'ite sect of Islam. There are some 850,000 Sunnite Moslems and small communities of Bahais, Jews, and Nestorian, Gregorian, Roman Catholic, and Protestant Christians.

Defense.—Since 1942 a United States military mission has aided in the equipment and training of the armed forces, which now number about 180,000. In March 1959 Iran and the United States concluded a bilateral agreement providing for the defense of Iran against aggression.

Finance.—In the consolidated budget for the Iranian calendar year 1338 (March 22, 1959—March 21, 1960), central government revenue was estimated at 27,565,000,000 rials; expenditures at 29,029,000,000 rials (at the official rate, 75.75 rials = U.S.$1). About 37% of the budget is earmarked for defense and internal security. In 1959 Iran's external debt stood at $326.2 million. In August 1959, gold and foreign exchange holdings totaled $226 million. In 1958 the gross national product was valued at $2.5 billion and the per capita income at $125.

Transportation and Communications.—Iran has 2,370 miles of railways. The principal line runs from the Persian Gulf through Teheran to the Caspian Sea, with branches from Teheran to Meshed and to Tabriz and Julfa. Iranian Airways serves 15 towns, and 14 international airlines serve Mehrabad Airport at Teheran. In 1958 Iran had some 65,000 telephones and was importing 250,000 radios annually. There were 82,000 automobiles in the country.

Economic Development.—During the year 1337 (1958–1959) the Plan Organization, charged with the execution of the second Seven-Year Plan (1956–62), expended 11.3 billion rials, bringing total expenditures to 32 billion rials. In 1959 an earlier decision of the government to assign 60% of annual oil revenues up to a certain figure to the Plan Organization was discarded in favor of a fixed sum of $130 million.

In February 1959 the role of the Plan Organization was reassessed by the government and its hard-driving managing director, Abol Hasan Ebtahaj, resigned when the organization was placed under the office of the prime minister and in a position subordinate to several of the ministries.

In May the International Bank for Reconstruction and Development announced a loan of $72 million for the Plan Organization's program for the construction and improvement of the country's roads.

Petroleum.—In 1957 Iran's oil revenues totaled $213 million and in 1958, $247 million. The country is the world's sixth largest oil producer. In 1959, despite a decline in the world price for crude oil, revenues were expected to reach $260 million. Output for the first eight months of 1959 totaled 29,030,000 metric tons, compared with full-year production in 1958 of 39,780,000 tons. Daily output in August 1959 was 883,000 barrels, or 4,000 barrels more than in August 1958. In 1959 the international consortium of oil companies, with operations centered at Abadan, employed 43,819 Iranians and 591 foreigners.

In the fall of 1959 two joint companies, one of which included the Italian Agip Mineraria and the National Iranian Oil Company and the other, Pan American International Oil Company and the National Iranian Oil Company, had drilling platforms in operation offshore near the head of the Persian Gulf. A new tanker port on the island of Kharg, to be connected by pipeline to the mainland, was under construction.

A pipeline carrying oil from the southern fields to Teheran was in operation, as was a branch line from Azna to Isfahan, and work was undertaken on an extension of the line from Teheran to Resht on the Caspian Sea. Drilling to define the limits of the field at Qum, south of Teheran, continued and a newly defined concession area in central Iran was opened for international bidding.

Other Minerals.—More than 120 mines have been worked for the extraction of coal, chromite, iron ore, copper, lead, sulfur, antimony, tin, nickel, cobalt, and red oxide. The recent influx of foreign concerns interested in the exploitation of these mineral resources was affected by a decline in world prices. Iran's 20-year dream of constructing an iron foundry and steel mill continued to be frustrated, as negotiations with German firms bogged down.

Industry.—Discussions undertaken in 1958 came to fruition in 1959 with the establishment of an Industrial and Mining Development Bank. This bank has a capital of 2.1 billion rials which includes 60% Iranian participation through the government and private investors, with the balance provided by several foreign banks.

At Teheran the rapid construction of factories and processing plants continued, reaching a total of 2,123. In all Iran there were 4,420 plants employing 143,130 workers, while the total labor force, including laborers in the petroleum and construction materials fields, totaled some 350,000. The country's electrical capacity stood at 421,777 kw. New cement plants were opened at Luchan and Dorud, virtually doubling the annual production of cement to 846,000 tons.

Agriculture.—Some 13 million acres were under cultivation, producing an adequate supply of staple foods and fibers with some surpluses for export. Agricultural production figures in metric tons for the Iranian calendar year 1337 (1958–59), with figures for 1336 in parentheses, are as follows: wheat, 2,700,000 (2,900,000); barley, 950,000 (1,200,000); rice, 600,000 (550,000); cotton, 108,000 (80,000); wool, 20,000 (20,000); tobacco, 15,000 (15,000); sugar, 100,000 (105,000); raisins, 60,000 (63,000); dates, 104,000 (104,000); dried apricots, 10,000 (10,000); almonds, 15,000 (14,000); and pistachios, 3,500 (7,000).

Foreign Trade.—Exports in 1337 (1958–59) were valued at $110.6 million; imports, at $607 million. Since these export figures exclude petroleum products, the total balance of trade was not so unfavorable as indicated by these figures. The principal exports other than petroleum were cotton, dried fruit and nuts, carpets, wool, seeds and gums, rice, and animal casings. The chief imports were sugar, machinery, motor vehicles and accessories, tires and tubes, iron and steel products, textiles, tea, and chemicals and pharmaceuticals. The major trading partners included Germany, the United States, Great Britain, the USSR, India, and Japan.

Principal Events, 1959. *Internal Affairs.*—The year 1959 was marked by a continuing influx of people from rural areas into overcrowded Teheran, by signs of inflation most marked in the prices of staples and in rising rents, by a remarkable growth in the number of new industries, and by an increasingly unfavorable balance of trade.

The internal political scene was calm. The two political parties sponsored by the government opened regional offices and competed for members, while the National Security Organization kept close watch on the underground activities of the Communist Tudeh Party and on some of the extreme nationalists.

The potentially explosive situation in neighboring Iraq continued to cause concern which was reflected in travel restrictions imposed on foreigners, in the formation of a civil defense organization, and in the installation of new radio stations for broadcasts in Arabic. There was an improvement in the somewhat uneasy relations between Iran and the United Arab Republic, and the government pursued its policy of inviting heads of the sheikdoms of the Persian Gulf to visit Teheran.

The shah continued to press for his program of social reforms and held several press conferences to explain his plans and reply to questions. Three bills, designed to provide the material required for the prosecution of appointed and elected officials engaged in illegal or corrupt practices, were recommended by the shah and passed by the Majlis. A more vigorous effort was made for the impartial collection of taxes, and there was a shift in emphasis from indirect to direct taxation. The shah continued his program of distributing crown lands to peasants, and a parallel program for the sale of state lands to farmers gained momentum.

On December 21 the shah was married to 21-year-old Farah Diba, and hopes were high that his third marriage would produce a male heir to the throne.

In spite of a generally favorable economic and financial situation there was an undercurrent of feeling that neither the vast economic development program nor the plans for social reforms were moving with adequate rapidity.

External Affairs.—Good relations with the non-Communist world and the open hostility of the USSR toward Iran were features of the year. In January the Soviet Union warned Iran against signing a military pact with the United States, and in the following month, responding to an Iranian invitation, a Soviet mission arrived in Teheran to negotiate a nonaggression pact. Suddenly the talks were broken off and the USSR announced that Iran had joined the ranks of the enemies of the Soviet Union. On March 5, Iran and the United States signed a bilateral agreement which provides for American aid in case of aggression against Iran; at the same time the United States signed parallel agreements with Turkey and Pakistan. The Soviet Union reacted by launching a series of bitter attacks against the shah and government of Iran, employing Soviet radio stations and newspapers and a so-called Free Iran station located within the USSR. The Soviet propaganda

attacks stopped during the visit of Premier Khrushchev to the United States in September, but they were renewed with full intensity a few weeks later.

In December a long-standing dispute with Iraq over the frontier waters of the Shatt-al-Arab at the head of the Persian Gulf flared up, and Iranian forces were rushed to the area.

In May the shah left Teheran on a state visit of a month's duration which took him to England, Denmark, France and the Netherlands.

Early in the year Iraq withdrew from the Baghdad Pact, and in August the secretariat, composed of representatives of Iran, Turkey, Pakistan, and Great Britain, announced that the name had been changed to the Central Treaty Organization (CENTO).

During his visit of six hours to Teheran on December 14, President Eisenhower addressed the Parliament and held a lengthy conversation with the shah. Eisenhower spoke of the contribution Iran was making to regional stability and of its brave stand in the face of a powerful propaganda assault.

The United States continued its programs of military support and economic aid on the levels of earlier years. In the economic field American aid in 1959 totaled $100 million—$47.5 million in loans and the balance in grants.

(See also MIDDLE EAST.)

DONALD N. WILBER,
Author of "Iran Past and Present."

IRAQ. A republic in southwestern Asia, Iraq is bounded on the north by Turkey, on the east by Iran, on the south by the Persian Gulf, Kuwait, and Saudi Arabia, and on the west by Jordan and the Syrian Region of the United Arab Republic. Its area is 171,599 square miles.

Population.—Approximately 75% of the 6,700,000 population (mid-year est., 1958) are Arabs, about 20% are Kurds, and the remainder are mostly Iranians and Turks. Baghdad, the capital, together with its suburbs, has a population of 1,086,000 (1957 census). Other important cities (with 1957 populations) are Mosul (179,646) and Basra (164,623), the country's chief port, located in the south on the Shatt-al-Arab; Kirkuk (1956 pop., 89,917); Najaf (1956 pop., 74,089); 'Amara; and Karbala.

Government.—The Iraqi republic was established by a military coup on July 14, 1958. A provisional constitution, published on July 27, 1958, declared the country to be an independent, sovereign, and Islamic republic and an integral part of the Arab nation. It recognized Kurdish "national rights," and emphasized the partnership of Arabs and Kurds in the Iraqi state. A three-member Council of Sovereignty serves as titular head of state. Parliament was dissolved following the 1958 coup, and all legislative and executive power was temporarily vested in a cabinet headed by Gen. Abdul Karim al-Kassem, the leader of the July revolution. On July 14, 1959, Premier Kassem announced that political parties, whose activities were suspended during 1959, would be permitted to resume their functions early in 1960 and that a popularly elected parliament would be assembled by July of that year.

Iraq is a member of the Arab League (q.v.) and of the United Nations. Its new flag (black, white, and green vertical stripes, with an eight-pointed red star containing a yellow circle with a white border in the white stripe) was flown at the United Nations for the first time on July 14, 1959.

Defense.—The armed services of Iraq include an army of five divisions, an air force of five fighter squadrons, and a river flotilla of four gunboats. The regular military establishment numbers about 60,000 men. During 1959 arms were purchased from both the Soviet bloc and from Great Britain. United States arms aid, however, was terminated (see below, *Principal Events*). A civil militia of some 35,000 persons, the People's Resistance Movement, came into being following the 1958 revolution to assure the continuity of the republican regime. Communist-dominated, the militia was placed under direct control of the regular army on July 5, 1959, and, on July 29, arms licenses were cancelled and training of the militia was halted.

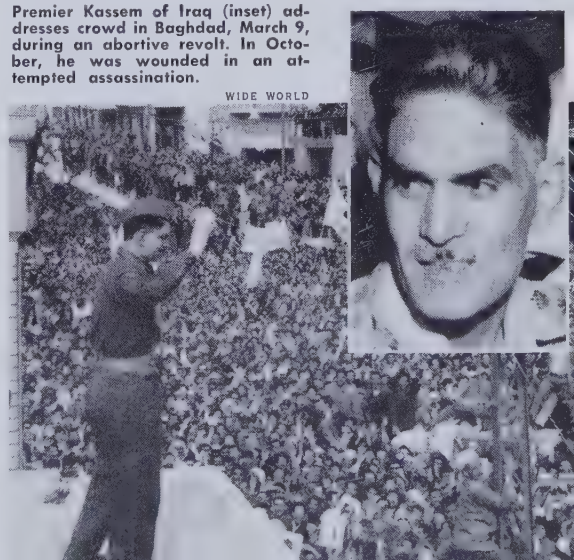
Finance.—The unit of currency is the Iraqi dinar (ID) which is valued (1959) at £1 sterling or U.S.$2.80. On June 23, 1959, Iraq ceased to be a member of the sterling bloc. The monetary supply on June 30, 1959, was ID111.8 million, of which ID34.4 million was deposit money. The government-operated Central Bank of Iraq controls the currency. The budget for the 1959–60 fiscal year called for expenditures of ID102.88 million (compared with ID76.92 million in 1958–59) and anticipated revenues of ID95.34 million. These figures do not include the development budget, which was slated to receive 50%, rather than the customary 70%, of the government's income from petroleum royalties (estimated at ID96 million for the fiscal year). Defense accounted for 33% of the regular budget, education for 11.2%, and health for 6.8%.

Education.—Elementary education is legally compulsory, but school facilities are inadequate and the law is not fully enforced. In 1956–57 there were 1,861 public elementary schools with an enrollment of 378,384 pupils, 210 secondary schools with 60,389 students, 23 vocational and technical schools, 37 teacher-training institutions and sessions of secondary rank, and 14 institutions of higher learning with a total of over 5,000 students. The University of Baghdad, formally inaugurated in October 1958, combines the former colleges of Arts and Sciences, Commerce and Economics, Law, Medicine, Dentistry, Veterinary Medicine, Engineering, Agriculture, Education, and the College for Girls. There are also in the capital theological, military, staff, and police colleges.

Religion.—Shi'ite Moslems, who principally inhabit the towns and villages of central and southern Iraq, form a slight majority of the population. Sunnite Moslems, constituting most of the rest of the inhabitants, include the people of northern Iraq, the nomads, and the urban populations of Baghdad and Basra. A small minority of Christians of the Nestorian, Gregorian, Jacobite, Chaldean, Orthodox Armenian, and Uniate sects is found in the principal cities and towns and in some northern villages.

Transportation and Communications.—The state-owned railroad system comprises about 1,100 miles of track. A standard-gauge line runs from Baghdad through Mosul to the border of the United Arab Republic (Syrian Region) and provides a direct rail link with Europe. Meter-gauge lines connect Baghdad with Basra, Khanaqin, Kirkuk, and Irbil. The government plans to modernize the entire system, replacing the Basra-Baghdad meter-gauge tracks with standard gauge. Roads suitable for vehicular traffic total about 6,800 miles, of which 1,800 are hard-surfaced. There were 25,900 passenger cars and 14,400 commercial vehicles in use in 1957. The government-operated Iraqi Airways provides domestic and foreign service, and a number of international airlines use the airport facilities at Basra and Baghdad. The state owns and operates telegraph and telephone services and conducts radio and television broadcasting. There were 64,637 telephones in use on Jan. 1, 1958.

Economic Development.—The republican regime continued in 1959 to place great emphasis on economic development and the creation of a welfare state. The minister of economics, Dr. Ibrahim Kubbah, on May 14, 1959, defined the social and economic policy of the government as one aimed at: (1) liquidating the Iraqi economy's subordination to foreign interests; (2) eliminating the semifeudal socioeconomic relations which had marked Iraqi society; and (3) building a balanced economy. He announced a program for the establishment of government-owned basic industries in such fields as the production of steel, petrochemicals, and machinery. At the same time he urged the investment of private, local capital in light industries and the production of consumer goods. Funds to finance the government's program are to come from oil revenues and from foreign loans.



Premier Kassem of Iraq (inset) addresses crowd in Baghdad, March 9, during an abortive revolt. In October, he was wounded in an attempted assassination.

WIDE WORLD

In 1959, the Soviet Union made available a credit of 550 million rubles at 2.5% interest, repayable in 12 years, and offered to provide technical assistance for the industrial, agricultural, and transportation development of Iraq. Projects envisaged under the terms of this loan include a steel mill of 600,000-ton capacity, a tractor factory, a nitrate plant, cotton and woolen textile factories, and new hydroelectric plants.

Although considerable progress was made during 1959 both in carrying out development projects of the old royal government and in inaugurating the expanded plans of the new government, full implementation of the program was delayed by political unrest, by a reorganization of the cabinet on July 13 which saw the abolition of the ministries of Economics and Development and of the Development Board, and the institution of a new Ministry of Planning, by the cancellation of the prerevolutionary contracts of some Western firms engaged in work on the development program, and by the withdrawal of the American technical missions following Prime Minister Kassem's denunciation of the Iraqi-American aid agreements on May 30.

Agriculture.—Iraq is primarily an agricultural country, although petroleum is its major source of revenue and industry is growing in importance. The chief crops are barley (953,000 metric tons in 1958), wheat (754,000 tons), and rice (137,000 tons). The country produces some 350,000 metric tons of dates annually, accounting for about 80% of the world's supply. Other agricultural products include cotton, tobacco, corn, millet, and citrus fruits. During 1959 a start was made toward implementing the five-year program, announced in September 1958, to expropriate excess holdings of large landowners and distribute them to landless peasants. On July 17, 1959, Prime Minister Kassem gave out the first parcels of land in a ceremony at Latifiya, 30 miles south of Baghdad.

Industry.—The principal industries are the extracting, transporting, and refining of petroleum, the generation of thermal electric power, building construction, spinning and weaving, the manufacture of tobacco products, baking, milling, cement manufacturing, tailoring, the production of soap and chemical products, date packing, and the manufacture of metal goods, shoes, bricks, glass, and matches. There are about 22,500 industrial establishments in the country, many of them small. The chief manufacturing center is Baghdad.

Petroleum.—The Iraq Petroleum Company, Ltd. and its affiliates, the Mosul Petroleum Company and the Basra Petroleum Company (owned jointly by British, Dutch, French, and United States interests) control most of Iraq's crude oil production at Kirkuk, Ain Zalah, and Butmah in the north and at Zubair in the south. The field at Naft Khaneh in eastern Iraq, where production is entirely for local consumption, is operated by the government.[1] The foreign oil companies pay to Iraq 50% of their profits in royalties and are committed to make available on request to the government 12.5% of their crude oil production for domestic consumption or for sale abroad. About two thirds of Iraq's crude petroleum exports are moved by pipeline to the Mediterranean ports of Baniyas in the Syrian Region of the United Arab Republic and Tripoli in Lebanon. The remainder is shipped by tanker from Basra or the oil port of Fao on the Shatt-al-Arab south of that city.

In 1959 the Basra Petroleum Company let contracts for the construction of two 34-mile submarine pipelines from Fao to a new deepwater terminal at the mouth of the river where facilities will be constructed for berthing two 65,000-ton tankers simultaneously. The project, to be completed in 1961 at a cost of $70 million, will increase the export capacity of southern Iraq from 12 million to 20 million tons annually.

Production of 35,493,000 metric tons of crude petroleum from the fields of the Iraq Petroleum Company group in 1958 resulted in government revenue of ID83.9 million (as compared with ID48.9 million in 1957, when the pipelines in Syria, sabotaged during the Suez crisis in 1956, were still not operating at full capacity, and with ID73.7 million in 1955, the last previous year of uninterrupted export). Total petroleum production, including the Naft Khaneh field, amounted to 35,640,000 metric tons in 1958. Production in the first half of 1959 was 19,563,000 metric tons.

Foreign Trade.—Exports for 1958 were valued at ID202.4 million, an increase from ID128.4 million in 1957 resulting principally from larger petroleum exports. Imports stood at ID100.8 million, a decline from the ID122.4 million of 1957, brought about by more stringent import restrictions. The principal exports were crude petroleum (ID185.3 million), barley (ID4.8 million), dates (ID2.9 million), and raw cotton (ID1.3 million). Major imports consisted of capital goods, including steel, machinery, and automobiles (ID35.4 million), textiles and clothing (ID12.6 million), sugar (ID7.9 million), and tea (ID5.7 million). The main suppliers were Great Britain, the United States, West Germany, Japan, Belgium, Ceylon, France, and India. The main buyers of Iraqi products were Great Britain, Denmark, Kuwait, and West Germany. Trade with the Soviet bloc was negligible in 1958 but increased considerably in 1959. On Jan. 4, 1959, a trade and payments agreement with Communist China was signed. On July 7 a barter deal was announced by which the Soviet Union would purchase 6,000 tons of Iraqi cotton (about 60% of the total yield of the 1958 crop).

Principal Events, 1959.—During the first half of 1959, Iraq forged closer economic and cultural ties with the Soviet bloc and severed some of its political and economic contacts with the West. Iraqi-Soviet negotiations in Baghdad between January 7 and February 5 culminated in a draft agreement on economic and technical cooperation. Further discussions took place in Moscow between February 25 and March 16, at which time a final convention was signed providing for Iraq a 550 million ruble credit for economic development. On May 5 an Iraqi-Soviet treaty on scientific and cultural cooperation was concluded, calling for the exchange of students, teachers, and scientists and the training of Iraqi experts in the Soviet Union.

Meanwhile, in a news conference on March 24, Premier Kassem announced Iraq's withdrawal from the Baghdad Pact (now the Central Treaty Organization), in which his government had taken no part since the coup of July 1958. On May 14 he formally dissociated Iraq from the Eisenhower Doctrine, and on May 30 he canceled all military and economic aid agreements with the United States. Foreign Minister Hashim Jawad, speaking on Radio Baghdad in June, defined Iraqi policy as one of positive neutrality in international affairs. He declared that the government was seeking to make Iraq's independence truly effective by terminating the restrictive foreign entanglements entered into by the previous regime, and that it would endeavor to preserve that independence for the future by a policy of nonalignment between East and West.

[1] On Dec. 3, 1959, Premier Kassem announced that the Iraq Petroleum Company group was being asked to surrender 60% of its concessionary areas, amounting to some 100,000 square miles.

Internally, Iraq was torn by a struggle between pro-Nasser pan-Arabists, who desired closer ties with the United Arab Republic, and the elements which opposed union with the UAR. In this latter group were both supporters of full Iraqi independence and Communists who opposed absorption in Nasser's United Arab Republic but who sought to move Iraq into the Soviet orbit. Prime Minister Kassem, needing Communist support against the pan-Arabists but anxious to avoid Communist domination, walked a tightrope in his determination to maintain independence for the Iraqi state.

On January 24 it was announced officially that Col. Abdul Salam Mohammed Arif, coleader of the July 1958 revolution but a dominant figure in the pan-Arab group, had been secretly tried on Dec. 27, 1958, and had been convicted of an attempt to murder the prime minister. (It was later made known that he had been sentenced to death, but by late 1959 there was no word of his execution.) On February 7, shortly after these revelations, Kassem accepted the resignation of six cabinet members and made eight new appointments in an apparent effort to strengthen the government against pan-Arabist pressures.

Mosul was the center on March 7–10 of a short-lived revolt led by Col. Abdul Wahab Shawaf, commander of the 5th Brigade, who was supported by pan-Arabists and by tribal sheiks and large landowners, alienated by the agrarian reforms of the Kassem regime. The rebellion was speedily crushed with the aid of the Kurds, the peasants, the Communists, and non-Communist liberals. The government, however, accused the United Arab Republic of complicity and on March 10 expelled nine members of the staff of the UAR embassy in Baghdad. Nasser replied by attacking Kassem as a traitor to the concept of Arab unity.

On April 29 the Iraqi Communist Party, despite the premier's request for a suspension of political activities, demanded representation in the cabinet. Kassem, however, did not give way. Instead, in June and July he adopted a number of measures strongly opposed by the Communists, releasing a considerable number of political prisoners, offering amnesty to rebels and dissidents who had fled the country, and curbing the activities of the militia units of the People's Resistance Movement. Although the ministry was reshuffled on July 13, none of the four new appointees was a known Communist Party member.

During the celebration of the first anniversary of the republic in Kirkuk on July 14, riots broke out between Turks and Kurds in which some 79 persons were killed. On July 29 the Prime Minister accused Iraqi Communist leaders of responsibility for the riots and charged them with a plot to create disturbances in all major cities of the country on July 14. Training for the People's Resistance Movement was ended and all arms licenses were canceled. On August 3 the Communist Party admitted errors in its policy and pledged its loyalty to the revolution and to Kassem.

Until the autumn of 1959, only six persons—five army officers and a civilian implicated in the Mosul revolt—had been executed for crimes against the state. On September 20, however, 13 army officers and 4 civilians were executed at Baghdad for their activities during the monarchy or for participation in the revolts and attempted revolts of late 1958 and early 1959. Although none of the more important political prisoners, such as Colonel Arif and former prime ministers Rashid Ali al-Gailani and Fadhil al-Jamali, were involved, these executions aroused a wave of denunciation of the Kassem regime in the UAR and to a lesser degree in other Arab lands. Since Lebanon, Jordan, and Saudi Arabia were then moving toward more cordial relations with Nasser, Iraq became increasingly isolated in the Arab world.

On the evening of October 7, an unsuccessful attempt was made to assassinate Kassem as he drove through the streets of Baghdad. The prime minister, struck by three bullets, was wounded in the shoulder and was hospitalized until December 3, but the country remained relatively quiet.

Relations between Iraq and Iran became strained in December 1959 after the shah of Iran and Premier Kassem had criticized the agreement of 1937 under which Iran controls the anchorage at Abadan in the Shatt-al-Arab, in an area where the frontier in general follows the low-water mark of the east (Iranian) bank of the river. Iran charged that Iraqi soldiers fired on Iranian shepherds near Abadan on December 15. At the end of the year, troop movements were reported to have taken place on both sides of the frontier.

University of Florida.

IRELAND, Northern. See NORTHERN IRELAND.

IRELAND, Republic of (EIRE). Lying west of England and separated from it by St. George's Channel and the Irish Sea, the Republic of Ireland (Eire) is an independent, sovereign state. Its association with the British Commonwealth was severed in 1948. A border fixed in 1925 divides the 26 counties of the republic (occupying 26,602 square miles) from six other counties constituting Northern Ireland, which remains part of the United Kingdom. Dublin (est. pop., 600,000) is the capital and Ireland's largest city and chief port.

Population.—The 1946–51 intercensal period showed an increase of population for the first time in more than a hundred years. A decline was revealed, however, by the 1956 census, when the population was 2,894,822, and the intercensal loss 65,771. Between 1951 and 1956 the natural increase (134,434) was offset by a net emigration rising to 196,763, mostly to the United Kingdom.

Government.—The National Parliament consists of a president (Eamon de Valera, elected June 17, 1959, for a 7-year term); a 60-member Senate (Seanad Eireann), chosen by an electoral college of 900 members; and a 147-member House of Representatives (Dail Eireann), in which 138 members are popularly elected. Sean Lemass, minister of industry and commerce and deputy prime minister, was elected prime minister on June 23, 1959, by a vote of 75 to 51 in the Dail.

At the end of July 1959 the Fianna Fail party held 77 parliamentary seats, giving the government an overall majority of 9 seats. Opposition membership was as follows: Fine Gael, 40; Labour, 12; Clann na Talmhan, 3; Clann na Problachta, 1; Sinn Fein, 4; and Independents, 9.

Finance.—In 1958–59 actual revenue on current account was £126,410,000 (tax revenue, £98,600,000) and expenditure £126,250,000, compared with estimates of £124,733,000 and £124,758,000, respectively. Revenue and expenditure for 1959–60 were expected to balance at about £127.6 million. The capital budget for 1959–60 provided for expenditure of £45,160,000, including £14,420,000 on voted capital services.

Education.—In 1958–59 the state expenditure for elementary free education was £9,225,530. National elementary schools numbered 4,869 in 1957, with total pupil enrollment of 488,197. In 1957–58, recognized secondary schools (conducted in many cases by religious orders) numbered 481, with 66,221 pupils. State expenditures for secondary education during this period were £2,171,840. Trade schools, which in 1957 numbered 260 and had 88,624 pupils, received £1,246,960 from the state in 1958–59. Higher education is given at the University of Dublin (Trinity College), which had 1,967 students in the academic year 1956–57, and at the National University of Ireland, which has 4 constituent colleges (Dublin, Cork, Galway, and St. Patrick's Maynooth) with an aggregate enrollment of 6,973 in 1957. There are also 2 state agricultural schools and 6 state-aided agricultural colleges.

Transportation.—In 1957 there were 50,770 miles of public roads, including 9,854 miles of main roads, and 39,854 miles of county roads. Railways had an aggregate

mileage of 2,492 in 1957. During the year ended March 31, 1958, services operated by Aer Lingus carried 445,626 passengers, 13,138,100 pounds of cargo, and 3,530,280 pounds of mail. Major airports are located at Shannon and Dublin.

Agriculture.—The estimated gross value of agricultural output was £179.3 million in 1958, the decline of £14,378,000 from the 1957 total being due to weather conditions in the latter part of the year. Livestock as at June 1, 1958, included 243,800 horses and ponies; 4,466,300 cattle (an advance of 49,100 over the 1957 total); 4,174,000 sheep; 900,000 pigs; and 14,078,000 poultry. The output of crops and peat was valued at £37,845,000 in 1958 (£46,697,000 in 1957), including wheat (6,167,000 cwt.) valued at £7,671,000. Decreased volumes were recorded for nearly all crops, as well as peat. Total milk production was 596 million gallons in 1958 (in 1957, 617,800,000 gallons).

Industry.—Irish industries, including mining and quarrying, engaged 212,218 persons in 1957. Gross output was valued at £413,751,000 (manufacturing, £344,630,000), as compared with a gross output of £407,153,000 (manufacturing, £329,597,000) in the previous year. Electricity generated in 1958 totaled 1,857,840,000 kw-hr. The manufacture of consumer goods is directed increasingly to the North American market. Tourists visiting Eire in 1958 totaled 3,336,000.

Foreign Trade.—The value of imports in the 1958 calendar year rose to £198.4 million (£184.2 million in 1957). Despite a decrease of £7.2 million in exports of live cattle, exports in 1958 reached a total of £130.7 million, which was only £600,000 lower than the record 1957 figure of £131.3 million. In the first quarter of 1959, the value of imports rose to £54.5 million, the highest of any quarter since 1955. First quarter exports of £30.2 million were down 4.3% in value and 9.7% in volume from January–March 1958. Principal exports (and their value) in the first quarter included live cattle (£9.5 million); foodstuffs of animal origin (£6 million); other foodstuffs (£1.2 million); drink (£1.6 million); and textiles (£1.7 million).

Principal Events, 1959.—Politically, the outstanding event of 1959 was Prime Minister Eamon de Valera's decision to resign his post and seek election to the presidency. Entering Parliament in 1917, Mr. de Valera held the office of prime minister six times, the latest term lasting from March 20, 1957, until his resignation early in 1959. At a presidential election held June 17, he easily defeated the Fine Gael candidate, Gen. Sean MacEoin, but was rebuffed by the electorate (486,989 to 453,322) in his sponsorship of the Fianna Fail party's proposal to abolish proportional representation. Sean Lemass, who succeeded Eamon de Valera as prime minister, had served as deputy prime minister in three successive governments.

Nearing the close of his second 7-year term as president, Sean T. O'Kelly accepted an invitation from President Eisenhower to visit the United States. He was the first president of the republic to make such a visit. Arriving in Washington on March 17, President O'Kelly addressed a joint session of Congress on the following day and later visited eight of the country's principal cities. In New York City he was welcomed with a ticker tape parade on March 21.

The release during March of suspected terrorists of the outlawed Irish Republican Army was protested by the government of Northern Ireland. British Prime Minister Harold Macmillan's endorsement of the protest was greeted with bitter criticism in the Irish press. The newly elected prime minister, Sean Lemass, proposed on July 9 that Northern Ireland join an all-Ireland state, retaining the same powers now delegated to it by the United Kingdom. The offer was rejected.

IRON AND STEEL. Significant events in the iron and steel industry in 1959 included record world steel production during the first half of 1959; the steel strike in the United States; expansion and modernization of production facilities in the European Coal and Steel Community countries; and a new method of making strip steel without the use of melting processes.

United States.—On Jan. 1, 1959, the crude steel annual capacity of United States plants was 147,633,670 net tons, an increase of 6,891,100 tons from Jan. 1, 1958. Production of crude steel in 1959 was estimated at 93,446,132 tons; production in the first half of the year amounted to a record 64,278,203 tons, but in the last half the steel strike cut production to 29,167,929 tons.

On July 15, 1959, a 116-day strike of 500,000 members of the United Steelworkers of America began in steel plants which account for 87% of total United States steel output. On Nov. 7, 1959, the Supreme Court upheld an injunction under the Taft-Hartley Act which directed the workers to return to the plants during an 80-day cooling-off period. Although wages, pensions, the cost of living, and inflation were significant issues, the major disagreement between the companies and the union was over proposed changes in work rules. One major steel producer, Kaiser Steel Corporation, and the union negotiated a contract on October 26; two other companies, Detroit Steel and Granite City Steel, soon signed similar contracts. A settlement between the union and the other steel producers was announced on Jan. 4, 1960, following lengthy bargaining sessions presided over by federal mediators. The final agreement was reportedly based on recommendations made in late December 1959 by Vice President Richard M. Nixon and Secretary of Labor James P. Mitchell. According to the terms of settlement, union members received increases estimated to be at least 32.8 cents per hour over a 30-month period (to July 1, 1962), and proposed changes in work practices were referred to a joint union-management committee.

In the first half of 1959, imports of steel mill products totaled 1,911,797 tons, and exports, 1,042,102 tons. It was reported that one of the chief reasons for the excess of imports over exports was that foreign steelworkers' wages were only one third to one seventh as much as those of steelworkers in the United States.

Expenditures scheduled in 1959 by iron and steel companies for new equipment and construction, estimated at over $1 billion, were intended to meet growing needs for more and better steels and to keep ahead of the competition of other materials and other countries.

Jones & Laughlin Steel Corporation planned to construct two of the world's largest basic oxygen steelmaking furnaces at its Cleveland Works, Cleveland, Ohio. Each furnace was expected to produce 160-ton heats and to have an annual capacity of 600,000 tons. That company also planned to build at the Cleveland Works a blast furnace having the largest hearth diameter (32 feet) in the United States. It was designed to produce 2,500 tons of iron daily.

The Kaiser Steel Corporation completed a $240 million expansion program at Fontana, Calif.,

which includes three oxygen furnaces with a combined capacity of 1,440,000 tons annually. The new installation is the first in the West which uses the oxygen process, and is the largest of its kind in the world. The National Steel Corporation announced plans for a $300 million expansion which will include a large steel finishing mill near Gary, Ind. A $375 million program of capital improvements in existing facilities, extending through 1963, was announced by the Republic Steel Corporation.

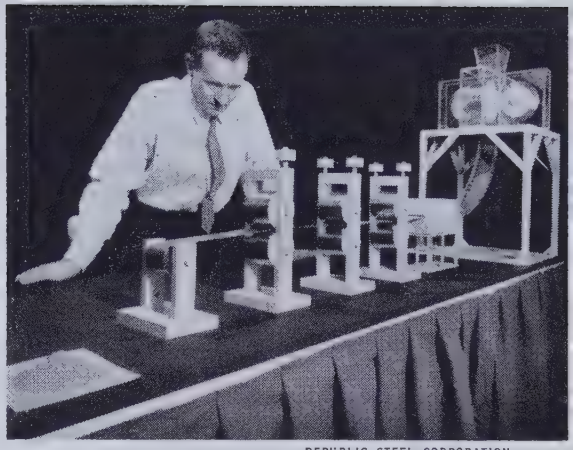
Canada.—Shipments of iron ore from the Labrador mines of Iron Ore Company of Canada began moving in May 1959 through the St. Lawrence Seaway to plants of The Youngstown Sheet & Tube Company in the United States.

The Iron Ore Company of Canada planned to open a mine in its Carol Lake iron ore deposit, about 220 miles north of Sept Îles (Seven Islands), Quebec, and to build a concentration plant, power house, and a town to house about 3,500 people. The completed project, estimated to cost $150 million, was designed to produce 6,000,000 tons of high grade iron mineral concentrates a year, beginning in late 1962.

On Feb. 11, 1959, Premier Joseph R. Smallwood of Newfoundland announced that Pickands Mather & Company of Cleveland, Ohio, and its associates in the Wabush Iron Company had agreed to pay $28,500,000 to Canadian Javelin, Ltd., for its 10 per cent stock interest in Wabush Iron Company and Wabush Lake Railway in Labrador.

The beginning of construction of a $20 million iron and steel plant by Consolidated Mining and Smelting Company at Kimberley, British Columbia, was announced on May 3, 1959, by Premier W. A. C. Bennett. Production was scheduled to begin early in 1961.

Other Countries.—A Peking (Communist China) radio broadcast on Aug. 26, 1959, of a communiqué of the Central Committee of the Communist Party admitted that its 1958 production figures, issued earlier in 1959, had been grossly overstated. The broadcast said that only 8,000,000 metric tons of the previously announced 11,080,000 tons of steel produced in 1958 were suitable for industrial purposes; that 3,080,000 tons of "metal" (pig iron) produced in 1958 in primitive furnaces were suitable only for requirements of rural areas; that such metal would no longer be a factor in the country's economic plans; and that the 1959 steel goal of 18 million tons had been reduced to 12 million.



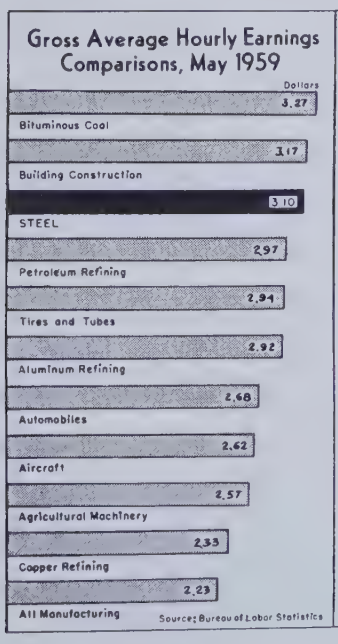
REPUBLIC STEEL CORPORATION

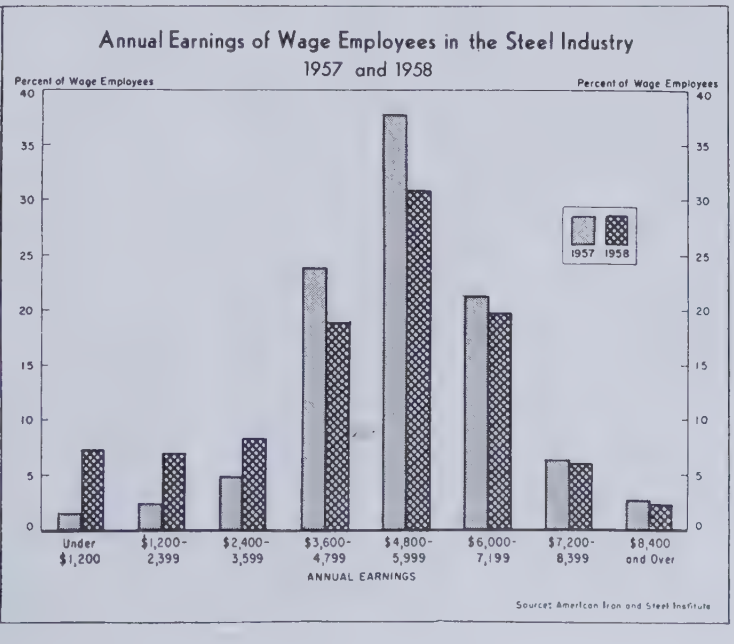
Operating sequence of a new process (announced by Republic Steel in June) which produces strip steel without melting is shown in this model. Iron powder, poured into funnel at upper right, is compressed between rolls atop the platform into semisolid strip, which is then passed through a heating furnace and hot-rolling stands to the desired gauge and full density. It emerges finally as hot-rolled steel in coils.

The Soviet Union's production figures for the first six months of 1959, as reported on July 14, 1959, by the Central Statistical Administration, included 29,300,000 tons of steel, 21,000,000 tons of pig iron, and 46,300,000 tons of iron ore. (The reported figures for the comparable 1958 period were 27,000,000, 19,300,000 and 43,000,000 tons, respectively.) Plans for producing at least 86 million tons of steel in 1965 involved the expansion of existing plants or the building of new plants in western Siberia (at Karaganda and near Stalinsk) and eastern Siberia (at Irkutsk and in the Krasnoyarsk region).

The European Coal and Steel Community (q.v) countries (Belgium, France, Italy, Luxembourg, the Netherlands, and West Germany) planned to spend an estimated total of $1,144,000,000 in 1959 for expansion and modernization of production facilities for iron, steel, coal, and

BUREAU OF LABOR STATISTICS; AMERICAN IRON AND STEEL INSTITUTE





iron ore, of which $585 million was planned for iron and steel plants.

The High Authority of the European Coal and Steel Community announced on Jan. 6, 1959, that it had approved the application of Alfred Krupp to buy Bochumer Verein für Gussstahlfabrikation A.G., which has an annual crude steel capacity of 1,600,000 tons. At that time the Allied Control Council's deconcentration order, giving Krupp five years to dispose of large portions of the Krupp family's industrial holdings, was technically valid. Krupp's application for a one-year extension of the deadline was in effect granted on February 2 when the Allies agreed to set up a commission to study the 1953 deconcentration order.

The French government decided to accelerate preparations for the building of Algeria's first steel plant (of 600,000 tons annual capacity), at Bône, by proposing a financial plan to enable steel production to begin in 1962. Proposed raw materials included domestic iron ore and Sahara natural gas for reducing the ore and for generating power.

Ground was broken in 1959 for a large steel plant in eastern Slovakia, near Košice, midway between the Krivoi Rog (Krivoy Rog) iron ore deposits of the Ukraine and the Ostrava coal region of Czechoslovakia. The new plant, along with the expansion of older plants, was expected to increase the annual steel output of Czechoslovakia by about 3,000,000 tons, to 9,200,000 tons in 1965.

The Liberian government announced on May 10, 1959, that it had approved a plan for the development of Liberia's Nimba Mountains iron ore deposit in Central Province by the Liberian American-Swedish Minerals Company and Bethlehem Steel Corporation. That deposit was reported to be one of the world's largest of high-grade iron ore.

PRODUCTION OF IRON ORE, PIG IRON AND FERROALLOYS, AND CRUDE STEEL, 1958

(In net tons of 2,000 pounds each)

Country	Iron ore	Pig iron and ferroalloys	Crude steel*
Algeria	2,529,779	...	...

* Ingots and steel for castings. (Sources: Bureau of Mines, U.S. Department of the Interior; Dominion Bureau of Statistics, Canada; *Monthly Bulletin of Statistics*, Statistical Office, United Nations; British Iron and Steel Federation, London; American Iron and Steel Institute, New York.)

World Production.—The U.S. Department of Commerce reported on Aug. 27, 1959, that world steel production rose to a record annual rate of 346 million tons in the first half of 1959. World production in 1958 of iron ore, pig iron and ferroalloys, and crude steel is shown in the accompanying table.

Technical Developments.—An experimental method of making steel strip without melting processes was announced on June 18, 1959, by Republic Steel Corporation, Cleveland, Ohio. Under the new system, iron ore was purified, reduced to metallic powder without melting, and the powder compressed by rollers into "semisolid strip." The strip was heated to 2,200°F. in a reducing atmosphere, hot-rolled to increase its density, cleaned, cold-rolled, annealed, and cut into desired lengths. The process did not require coke ovens, blast furnaces, steelmaking furnaces, soaking pits, and blooming mills.

Brymbo Steel Works Ltd., Brymbo, Wales, developed a process of removing silicon and phosphorus from blast furnace iron (containing 0.6% to 0.8% phosphorus) by blowing oxygen and powdered lime, limestone, and iron oxide into the molten metal. Iron that is difficult to convert into steel by conventional processes is thus "prerefined" and finally refined in an electric furnace. (See also METALLURGY.)

ISLE OF MAN. Lying in the Irish Sea off the coast of Cumberland, this British possession (area, 227 square miles; pop., 55,437 at 1951 census; est. 55,000 in 1957) is administered in accordance with its own laws and distinctive institutions. Douglas (pop., 20,361 in 1956) is the capital; Ramsey (4,621), Peel (2,612), and Castletown (1,755) are its chief ports.

Queen Elizabeth II is represented by a lieutenant governor (Sir Ambrose D. F. Dundas, assumed office Sept. 8, 1952), who is assisted by a 7-member executive council. The United Kingdom Parliament has power to legislate for the Isle of Man, although it is not represented there. It has its own legislature, consisting of a 10-member Legislative Council and an elected 24-member House of Keys; when sitting together, these bodies compose the Court of Tynwald. A commission on the Manx constitution presented its report in 1959.

Total revenue in 1956–57 was £3,427,887; expenditure, £3,269,766. In 1958 there were 31 primary schools (4,385 pupils), 5 secondary schools (2,604 pupils), and 10 other schools. The total area under crops was 76,866 acres in 1958; livestock included 26,703 cattle and 98,561 sheep. There is a thriving tourist industry. Railways total 70 miles; roads, 410 miles.

ISOTOPES. See Index entry.

ISRAEL. A republic of the Middle East, situated on the Mediterranean coast and bordered by the United Arab Republic, Jordan, and Lebanon. Area, 7,993 square miles; pop. (Jan. 1, 1958), 2,031,672 (including 221,524 non-Jews, chiefly Arab Moslems). Chief cities and populations (est. 1958): Jerusalem (the capital), 156,000; Tel Aviv-

Jaffa, 380,000; and Haifa, 170,000. Hebrew is the official language.

Government.—The president of the republic, whose functions are mainly of a formal character, is elected by the Knesset (Assembly) for a 5-year term. Itzhak Ben-Zvi has served as president since 1952, having been re-elected in 1957. The Knesset, Israel's unicameral legislature, has 120 members elected for a 4-year term by proportional representation. The national elections of Nov. 3, 1959, resulted in the following seating in the Knesset for the principal parties (seating based on the 1955 elections given in parentheses): Mapai (Israel Labor Party), 47 (40); Herut (rightist nationalists), 17 (15); National Religious Front, 12 (11); Mapam (leftist Socialists), 9 (9); and General Zionists, 8 (13). David Ben-Gurion (Mapai) heads a Mapai-led coalition cabinet approved by the Knesset on Dec. 17, 1959.

Education.—Illiteracy is negligible among the Jewish population and is declining among the Arabs. In the 1957–58 school year there were 1,099 Hebrew elementary schools (321,216 pupils) and 71 Hebrew secondary schools (16,728); 119 state-sponsored Arab elementary schools (26,401) and 5 secondary schools (945). About 95% of Arab boys and 50% of Arab girls attended school. Kindergartens in Israel had over 77,000 pupils in 1957–58, and there were also several thousand students in evening and continuation classes, vocational and agricultural schools, teachers colleges, and other special schools. Higher institutions include the Hebrew University in Jerusalem (4,357 students in 1957–58), the Israel Institute of Technology at Haifa (2,344), the School of Law and Economics at Tel Aviv (1,500), and Bar-Ilan University (346).

Religion.—The majority of the population is of the Jewish faith, though freedom of worship exists for all groups. The Ministry of Religious Affairs aids and safeguards the various religious communities, but there is no established church. For the Jewish population, certain matters of personal status, such as marriage and divorce, are exclusively within the jurisdiction of the rabbinical courts. The main non-Jewish groups are Moslems (152,500), Christians (47,500, chiefly Greek Catholics and Greek Orthodox), and Druses (21,500).

Immigration.—In the period May 15, 1948–Dec. 31, 1958, a total of 922,274 immigrants entered Israel, of whom 44.6% came from Europe, 29.6% from Asia, and 24.9% from Africa. Immigrants in 1958 numbered 27,287 (72,634 in 1957).

Finance.—The budget for the fiscal year beginning on April 1, 1959, totaled I£1,472 million, including I£481 million for development. Projected expenditure for defense services and reserves, the chief item in the ordinary budget, totaled I£371 million. Among major allocations for development were I£179 million for housing, I£150 million for agriculture, I£55 million for industry and crafts, and I£45 million for communications and public works. Israel's current balance of payments deficit of $334 million in 1958 was almost entirely covered as follows: United States grants in aid, $11 million, and agricultural surpluses paid for in local currency, $28 million; German reparations, $70 million, and restitution payments to individuals, $65 million; United Jewish Appeal and other collections and transfers in cash, $86 million, and in goods, $18 million. At the principal exchange rate, the Israeli pound (I£) equals U.S.$0.5536.

Transportation and Communications.—Israel's state-owned railways included 258 miles of main lines and 134 miles of branch lines in operation in 1958. Main roads maintained by the government totaled 1,860 miles, with an additional 396 miles maintained by local authorities. Israel's merchant fleet (41 vessels with an aggregate displacement capacity of 278,000 tons deadweight at the end of 1958) carries about 30% of the nation's sea-borne trade. Lod Airport is a major international air terminus. El Al Israel Airlines Ltd. operates regular services to New York, London, and other centers. Passenger cars numbered 25,509 in 1958; telephones, 90,681; licensed radio sets, 360,000; and daily newspapers, 22 (7 in foreign languages).

Production.—The Israeli economy, lacking the natural resources for a heavy industry, features the production of diversified light items, such as metal and electrical appliances, electrical and electronic equipment, foodstuffs, textiles, chemicals, rubber goods, paper and cardboard, ceramics and glass, building materials, cut and polished diamonds, leather, and shoes. Industrial output rose about 10% in 1958, with foodstuffs, minerals, vehicles, clothing and footwear, and electrical goods showing the greatest gains. Persons employed in industry numbered 142,000 in 1958, or about 20% of the estimated labor force of 698,300. Israel's principal minerals and output in the 1958–59 fiscal year were: potash, 110,000 tons; phosphate rock, 211,000; bromine, 1,665; and petroleum, 105,000.

WIDE WORLD

Informal portrait of Israeli Prime Minister Ben-Gurion at work. Resigning in July over the disputed sale to West Germany of Israeli-made arms, he returned to office after the victory of his Mapai Party in elections on November 3.

A record 75,110 tourists visited Israel in 1958, and the $25 million in revenue from tourism (including income of Israel's sea and air carriers) constituted the nation's second largest source of foreign currency. Israel's gross national product was estimated at I£3,530 million in 1958, a rise of about 8% in constant prices.

Israeli agriculture, organized largely along cooperative or collective lines, engages 17.6% of the labor force (1958), provides about 70% of domestic food requirements, and contributes over 40% of the value of exports. In the 10-year period from 1948–49 to 1957–58, the area under cultivation rose from 400,000 acres to about 1 million, and irrigated area from 66,000 acres to 270,000. Israel's chief agricultural products are citrus, grapes, bananas, and other fruits; wheat, barley, oats, and hay; vegetables and potatoes; milk, eggs, meat, and poultry; and olives, cotton, peanuts, and sugar beets. The total value of agricultural output (in 1956 prices) was I£667 million in 1957–58. The important citrus crop amounted to 14 million cases in 1958–59, yielding 9.5 million for export.

Foreign Trade.—Exports in 1958 totaled I£259.8 million; imports, I£780.4 million. The export coverage was thus 33.2% of imports, as compared with 32.4% in 1957. Citrus and other agricultural produce provided 41.8% of 1958 exports; diamonds, 23.2%; textiles, 6.8%. Imports are mainly industrial and agricultural raw materials, equipment and other investment goods, and foodstuffs and other goods for direct consumption. Britain, the chief market for Israel's citrus sales, purchased 20% of Israeli exports in 1958; the United States, 14%; and West Germany, 8%. The United States provided 28.5% of Israeli imports; West Germany, 14.8%; and Britain, 12.3%.

Principal Events, 1959.—Israel's fourth general election, which took place on November 3, resulted in substantial gains for Prime Minister David Ben-Gurion's Mapai. The Mapai, which has been the dominant party in Israel since the establishment of the state in 1948, obtained 38% of the popular vote (32% in 1955) and 47 seats in the Knesset, an increase of 7. The Herut, the chief opposition party which advocates the expansion of Israel beyond her present borders, received 17 seats, a gain of 2. The main losers were the General Zionists and the small Communist Party. After several weeks of negotiations, a new Ben-Gurion cabinet was approved by the Knesset on December 17. The Mapai-led coalition again included the National Religious Front, Mapam, Achdut Ha'avodah, and Progressives.

Although the election was marked by a certain apathy on the part of the voters, the results indi-

cated a general endorsement of Mapai policies. Within Ben-Gurion's coalition government, the two leftist socialist parties (Mapam and Achdut Ha'avodah) had joined issue with the prime minister in June over a contract for the manufacture and sale of grenade launchers to West Germany. The leftists, who oppose strong Israeli ties to the West, charged that it was wholly unfitting for Israel to provide arms to a nation responsible for the death of six million Jews. Ben-Gurion answered that he distinguished between the West Germany of the present and the Germany under the Nazis, and that the failure to make such a distinction was contrary to Israeli interests as well as to the cause of world democracy. Backed by a Knesset vote on July 1, Ben-Gurion sought to oust the four leftist members of his coalition for a breach of cabinet discipline. When they refused to resign, Ben-Gurion handed his resignation to President Itzhak Ben-Zvi on July 5, but continued to head a caretaker government until after the November election.

Israel's problems of immigrant absorption were reflected in a series of riots in July at Haifa, Beersheba, and Migdal Haemek, by North African immigrants who charged that they were subjected to discrimination in housing and employment. Government and police officials attributed the disorders to hooliganism and denied the charges of discrimination, though conceding that problems of adjustment had played a role. Earlier in the year, Israelis had once again begun preparations to receive a heavy influx of immigrants, this time from Rumania, where the Communist regime in late 1958 had suddenly lifted restrictions on Jewish emigration. Following protests by the United Arab Republic, however, the Bucharest government closed the gates once more, and the flow virtually ceased by March 1959.

The Israeli economy continued to show gains in 1959, although the failure significantly to reduce the import-export gap in 1958 had proved disappointing. Unemployment dwindled further, and the cost of living, which had risen only about 3% in 1958 (compared with more than 6% in 1957), remained virtually stationary in the first half of 1959, despite the ending of rationing early in the year. Work proceeded on a railroad extension to Dimona, on expansion of the port of Eilat (Elath), and on other large-scale projects in industry, minerals exploitation, transportation, and land-improvement. On July 17 an agreement was signed with an international financial group for the construction of a $20 million 16-inch oil pipeline from Eilat to Beersheba, to replace the existing 8-inch line. The Knesset on August 6 voted a new law for the encouragement of foreign investment by permitting full repatriation of profits, certain tax exemptions, and other advantages.

Relations with the bordering Arab states continued to be Israel's chief concern in the sphere of foreign relations. For several years, Israeli ships had been barred from the Suez Canal (q.v.) by the Egyptian government, despite a U.N. Security Council resolution of 1951 opposing such action. In 1959, United Arab Republic President Gamal Abdel Nasser further extended this restriction to non-Israeli ships carrying Israeli cargoes. On February 26 and March 13, two foreign-flag ships bound for Asian ports were halted and their cargoes of Israeli cement, potash, and other goods confiscated. On May 21 the UAR halted the Danish vessel *Inge Toft* and ordered its Israeli cargo confiscated as a prize of war. Following Israeli protests, the matter was taken up by U.N. Secretary General Dag Hammarskjöld in talks with UAR leaders in Cairo, July 1–2, but the talks appeared inconclusive. At the U.N. General Assembly on September 24, Israeli Foreign Minister Golda Meir denounced the UAR actions as a breach of international law and a potential threat to the shipping of all nations using the canal. In December, a Greek freighter carrying Israeli cement was detained in the canal by UAR authorities.

Border strife continued in 1959, although on a considerably smaller scale than in the years before the Israeli attack on Sinai in 1956. An Israeli shepherd was killed by UAR forces near the Syrian border on January 23, and on January 30 Israel complained to the U.N. Security Council of continuing border violations. On February 4, two Bedouins were killed by an Israeli force, and on February 17 two Egyptian police officers were killed by Israelis; both incidents occurred within the Egyptian border, and Israel was condemned by the U.N. Egyptian-Israeli Mixed Armistice Commission, which Israel has boycotted since 1956. Israel reported the killing of Arab infiltrators in the Negev on March 7, April 27, and July 15; the killing of an Israeli Army captain in the Negev on September 7; and the killing of three Bedouins in the Negev on September 20. A new element in the border strife was the occurrence of brief air clashes along the southern frontier between French-built Israeli Mystère jets and Soviet-built UAR MIG-17's on January 8, April 28, June 7, and November 4.

Abba Eban, Israel's ambassador to the United States and chief delegate to the United Nations, resigned to enter Israeli politics, and was succeeded as ambassador by Avraham Harman on July 2. Ogden R. Reid, the new United States ambassador to Israel, presented his credentials to President Ben-Zvi on July 2.

M. J. G.

ITALIAN LITERATURE. The 1959 Nobel Prize in literature was awarded to the Italian poet, Salvatore Quasimodo (q.v.), whose collections of poems, including *Ed è subito sera* (1942), *Giorno dopo giorno* (1947), *La vita non è sogno* (1949), and, most recently, *La terra impareggiabile* (1958), display a rare combination of fine craftsmanship and intense feeling for man's spiritual yearnings. The homage to Quasimodo was also a tribute to Italian poetry, which during the past quarter of a century has exhibited numerous signs of vitality and diversity. After World War I, such poets as Giuseppe Ungaretti and Eugenio Montale introduced *poesia pura* into Italian verse—poetry that tends to be lyrical, allusive, and elusive—a movement in which Quasimodo played an important role.

Fiction.—In 1959 the Strega Prize, Italy's highest literary award, went to the posthumously published *Il gattopardo* by Giuseppe Tomasi, Duke of Palma and Prince of Lampedusa. The award highlighted the spectacular career of this historical novel, which in a short space of time sold an unprecedented (for fiction in Italy) 70,000 copies. The book brilliantly tells the story of a Sicilian nobleman during the early 1860's, when Garibaldi invaded Sicily and united it to the young kingdom of Italy. *Il gattopardo* is scheduled for American publication in the spring of 1960; the translation, by Archibald Colquhoun, is tentatively entitled *The Leopard*.

While many critics link *Il gattopardo* with the tradition of the Italian classics of the 19th century, it is the writers of the postwar generation who continue to occupy the forefront of the literary scene. Alberto Moravia published a new volume of his *Racconti Romani*—tales which are not specifically Roman but, rather, dwell mostly on the psychological twists and amorous adventures of the Italian middle class. With his usual psychological sophistication, Mario Soldati, novelist and film director,

wrote a series of sketches and short stories which were collected under the title *Messa dei villeggianti.*

As suggested by the foregoing, short literary pieces loom large in Italian letters, and, significantly, they occupy a place of honor. The 1959 Viareggio Prize, second in importance after the Strega, was given to Marino Moretti, the 74-year-old author, for all his work in the field of the short story. Italo Calvino, a young but already distinguished writer, won the first Bagutta Prize for his collection of short stories written from 1947 to 1959. The second Bagutta award was given to Romano Bilenchi, a venerable storyteller.

Among the novels by young authors, *Una vita violenta,* by the highly talented Pier Paolo Pasolini, aroused controversy and attracted general attention. Like other Pasolini works, *Una vita violenta* deals with the roughnecks and juvenile delinquents of the area around Rome, and is written in a colloquial style. Pasolini's use of slang and dialect is more than a naturalistic device, for he heads a movement that is trying to revitalize Italian literature by introducing into it various dialectal forms. Another successful novel to make large use of the colloquial idiom (in this case the Lombard dialect) is *Il calzolaio di Vigevano* by Lucio Mastronardi.

The best novels of the season, however, were not part of Pasolini's movement. In *Una posizione sociale,* Giose Rimanelli studies human relationships through a child's eyes. Glorifying jazz, the novel has an appendix of four musical scores and is distributed with a jazz phonograph record. Sexual and moral deviates, members of Italy's "beat" generation, are successfully represented in *La finta sorella* by Massimo Franciosa. *La pietra bianca* by Carlo Coccioli, a novelist in the Roman Catholic tradition, is overburdened with psychological conflicts, theological implications, and melodramatic surprises.

The neorealistic current in Italian fiction continues to run strong. Among the works to be included in this vast category are *Donnarumma all'assalto,* a striking documentary novel about the Italian south by Ottiero Ottieri, and *Primavera di bellezza,* in which Beppe Fenoglio depicts the disintegration of the Italian Army after the Badoglio armistice of 1943. In *Mille tradimenti,* Ugo Pirro uses Fenoglio's theme, but in a more melodramatic fashion. *Pace a El-Alamein* by Giulio Palladino gives a restrained and poetic picture of Italy's African campaign in World War II.

Also of importance during the year were *Una vampata di rossore* by Domenico Rea, a popular chronicler of Neapolitan life, and *Una e una notte* by Ennio Flaiano, a Roman journalist. *Mamma marcia,* the posthumously published novel by Curzio Malaparte, which depicts the decline of Europe, is considered by many critics to be crude and sketchy.

Nonfiction.—Novelist Carlo Levi added to his travelogues with *La doppia notte dei tigli,* in which he attempts to analyze the postwar German mentality. In *La casa della vita,* scholar Mario Praz describes his life of artistic refinement and intellectualism. A renewed interest in futurism, the artistic movement that began in Italy about 1910, contributed to the success of Walter Vaccari's *La vita e tumulti di Marinetti,* a biography of Emilio Marinetti (1876–1944), the founder of the futurist movement, and to A. M. Ripellino's *Mayakovsky e il teatro Russo d'avanguardia,* about Vladimir Mayakovski (1893–1930), the Russian futurist poet.

Translations.—The following is a selected list of Italian books translated into English and published in the United States in 1959: Calvino, Italo, *The Baron in the Trees,* tr. by Archibald Colquhoun from *Il barone rampante; The Comedy of Dante Alighieri* (3 vols.), tr. by Mary Prentice; de Cespedes, Alba, *The Secret,* tr. by Isabel Quigly from *Quaderno proibito;* Dolci, Danilo, *Report from Palermo,* tr. by P. D. Cummins from *Inchiesta a Palermo;* Morante, Elsa, *Arturo's Island,* tr. by I. Quigly from *L'isola di Arturo;* Pavese, Cesare, *Among Women Only,* tr. by D. D. Paige from *Tra donne sole;* Pavese, C., *The Devil in the Hills,* tr. by D. Paige from *Il diavolo sulle colline;* Pirandello, Luigi, *Short Stories,* tr. by Lily Duplaix.

ITALIAN SOMALILAND. See SOMALILAND.

ITALY. A republic of south central Europe, Italy extends in a southeasterly direction into the Mediterranean Sea. Including Sicily, Sardinia, and about 70 smaller islands, it has an area of 116,319 square miles. The country is divided into 19 regions, which are subdivided into 92 provinces. The former territory of Trieste now constitutes a province in the region of Friuli–Venezia Giulia. Under a United Nations trusteeship scheduled to end on Dec. 2, 1960, Italy administers its former colony of Somaliland (q.v.).

Population.—On June 30, 1959, the population was estimated at 48,952,000. In 1958 there were 873,530 births and 457,915 deaths, resulting in a net increase of 415,615; in the first half of 1959 the net increase was 218,867. A total of 334,000 Italians emigrated in 1958, while 210,000 returned to Italy.

In April 1959, Rome, the capital, had an estimated population of 2,000,000. Other large cities, with estimated populations (Dec. 31, 1956), are Milan, 1,355,410; Naples, 1,096,755; Turin, 853,179; Genoa, 727,012; and Palermo, 557,468.

Government.—Parliament consists of a Chamber of Deputies of 596 members elected for 5 years, and a Senate of 253 members, of whom 246 are elected for 6 years and 7 (2 ex officio and 5 appointed) are life members. In the Parliament elected on May 25–26, 1958, party membership is as follows:

	Chamber of Deputies	Senate
Christian Democrats	273	123
Communists	140	59
Italian Socialists	84[1]	36
Italian Social Movement	24	8
Democratic Socialists	22[1]	5
Liberals	17	4
Popular Monarchists[2]	14	5
National Monarchists[2]	11	2
Republicans	6	0
South Tirol People's Party	3	2
Others	2	2
Total	596	246[3]

[1] On July 24, 1959, 5 Democratic Socialist deputies switched to the Italian Socialist Party, increasing its total to 89. [2] The two Monarchist parties merged in April 1959. [3] Plus 7 senators for life.

On April 29, 1955, Giovanni Gronchi was elected to a 7-year term as president of the republic at a joint session of Parliament in which 3 delegates from each region also participated. Antonio Segni, a Christian Democrat, became premier on Feb. 15, 1959. (See also below, *Principal Events, 1959.*)

Religion.—Italy is essentially a Roman Catholic nation, although there are about 150,000 Protestants, 40,000 Jews, and several thousand persons who profess the Greek Orthodox faith. The constitution of 1948 provides for absolute freedom of worship. As of 1957, there were 282 Roman Catholic dioceses and 25,333 parishes.

A ceremonial visit by President Gronchi to Pope John XXIII on May 6, 1959, emphasized the harmony that exists in church-state relations. On the previous day, the president had received the Vatican's highest honor, the Supreme Order of Christ.

Education.—In the 1956–57 school year enrollment was as follows: kindergartens, 1,072,233; elementary schools, 4,775,442; junior high schools, 481,572; vocational and technical schools, 799,026; classical, scientific, and normal schools, 301,499. Universities and other institutions of higher education had 157,117 regular and 49,075 special students in 1958–59. Of the 487.5 billion lire (620.6 lire = U.S. $1) provided in the 1959–60 budget for education, 41% was earmarked for elementary education.

Budget.—The 1957–58 budget provided for expenditures of 3,704.4 billion lire and revenue of 3,442.8 billion, leaving a deficit of 261.6 billion. The deficit was reduced substantially in the budget for 1958–59, which estimated expenditures at 3,258 billion lire and revenue at 3,123 billion; and in that for 1959–60, in which the corresponding figures were 3,473 billion and 3,344 billion.

Transportation and Communications.—At the beginning of 1958, Italy had 13,412 miles of railways, of which 10,392 miles were operated by the Italian State Railways; and 112,479 miles of roads. The first section of the Autostrada del Sole, a 459-mile highway from Milan to Naples, was completed in December 1958. There are two

regularly scheduled Italian airlines: Alitalia and Linee Aeree Italiane (LAI). The gross tonnage of the Italian merchant marine was increased from 4,965,261 in 1958 to 5,123,852 in 1959, making it the sixth largest in the world. A new luxury liner, the 32,000-ton *Leonardo da Vinci*, was launched at Genoa on Dec. 7, 1958.

Telephones numbered 2,871,000 as of Jan. 1, 1958. In 1958 there were approximately 7,000,000 radios and 880,000 television sets in the country.

Economic Conditions. *National Income and Foreign Aid.*—The gross national income increased from 14,962 billion lire in 1957 to 15,875 billion in 1958, or 6.1%, as shown in the accompanying table.

	1957[1]	1958
	(billions of lire)	
Net private product	10,066	10,704
Net public product	1,477	1,584
Net domestic product at cost	11,543	12,288
Taxes on value of goods and services	1,940	2,049
Net product at market prices	13,483	14,337
Net income from abroad	50	56
National income	13,533	14,393
Amortization	1,429	1,482
Gross national income	14,962	15,875

[1] Revised.

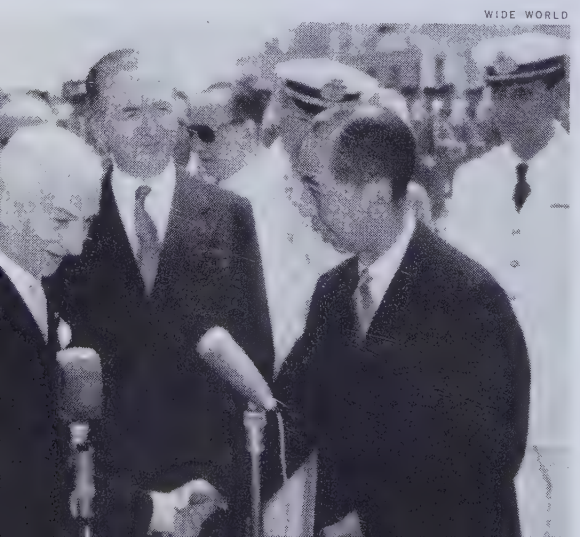
In June 1959, Italian shipping and steel interests borrowed $25 million from three New York banks. The money was to be used to help finance the new building program of the Italian Line and the expansion program of the Società Finanziaria Siderurgica. In September, the Fund for the South borrowed $40 million from the International Bank for Reconstruction and Development (IBRD) to help finance a 150,000-kw. atomic power plant on the Garigliano River, and in November the Export-Import Bank of Washington lent $34 million toward the cost of a 165,000-kw. atomic plant in the north. (See also below, *Fund for the South.*)

Labor.—With a labor force of 20,000,000, Italy had an average of 1,755,000 unemployed in 1958 and 1,789,000 in the first half of 1959. While the government is doing its best to improve the employment situation, so far it has only been able to find work for the 200,000 who enter the labor market annually for the first time.

In 1958 there were 1,937 strikes involving 1,283,301 workers, who lost 33,375,000 work-hours, as compared with a loss of 36,950,000 work-hours in 1957. Labor disputes in 1959, some of which were accompanied by violence, involved seamen, railway and urban transit employees, and workers in steel and other metal plants, spaghetti factories, cement mills, quarries, and banks.

Prime Minister Nobusuke Kishi (right) of Japan is greeted on his arrival for visit in Rome, July 19, by Italian Premier Antonio Segni (left) and Foreign Minister Giuseppe Pella.

WIDE WORLD



Consumption and Prices.—At current retail prices consumption increased from 10,124 billion lire in 1957 to 10,564 billion in 1958, or 4.3%. At the same time per capita income rose by 4.1%.

The general wholesale price index (1953 = 100) was 97.1 in July 1959, as compared with 100.8 in July 1958. The general retail price index (1953 = 100) also declined, from an average of 113.3 in the first half of 1958 to 112.2 in the same period of 1959. The cost-of-living index (1938 = 1) declined slightly, from 66.93 in the first half of 1958 to 66.30 in the first half of 1959.

Industrial Production.—The general index of industrial production (1953 = 100) increased from 137.7 in 1957 to 141.4 in 1958 and to 149.6 in the first half of 1959. Indices for the main branches of industry were as follows:

	1957	1958	1st half of 1959
Mining	156.1	158.7	163.1
Manufacturing	138.4	141.4	150.2
Electricity and gas	126.6	132.7	137.3

Production increases were noted in most fields, although there were declines in the iron and steel and textile industries. The output of important products, in thousands of metric tons, was as follows in 1958 (1957 figures in parentheses): iron ore, 1,291 (1,603); coal and lignite, 1,539 (1,417); crude petroleum, 1,534 (1,262); crude steel, 6,269 (6,787); pig iron and ferroalloys, 2,172 (2,208); gasoline, 4,670 (4,355); fuel oil, 11,900 (9,621); cement, 12,600 (11,952); ammonium nitrate, 556 (334); chemical fertilizers, 608 (513); cotton, 200 (212); and artificial fibers, 141 (150). Production of motor vehicles rose from 351,799 in 1957 to 403,548 in 1958; that of typewriters and calculating machines, from 527,729 to 640,062; electrical energy, from 42,726 million to 45,150 million kw.-hr.; and natural gas, from 4,987 million to 5,182 million cubic meters.

In 1958, 275,971 new dwellings were built, as compared with 273,535 in 1957. In the first half of 1959, 137,111 dwellings were completed.

Agriculture.—Agricultural production was valued at 2,656 billion lire in 1958, or 7.6% more than the 1957 total of 2,469 billion. The output of most products increased, although that of cotton declined (from 8,270 to 7,530 metric tons), as did the peach, prune, and almond crops. Production of major crops in 1958 (in thousands of metric tons with 1957 figures in parentheses) was as follows: wheat, 9,715 (8,478); corn, 3,674 (3,496); barley, 296 (296); oats, 596 (582); potatoes, 3,664 (3,157); tomatoes, 2,541 (1,961); sugar beets, 7,689 (6,176); grapes, 10,531 (6,900); apples, 1,627 (971); and pears, 519 (356). In 1958–59, 1,600 million pounds of rice and 254,000 short tons of olive oil were produced; in 1958, 26,770,000 boxes of oranges and tangerines and 11,600,000 boxes of lemons.

The general increase in production was due to the introduction of new scientific methods of cultivation; a greater use of chemical fertilizers (3,615,800 metric tons in 1956–57, as compared with 2,857,600 tons in 1952–53); and a rise in the number of tractors, from 66,371 in 1951 to 207,131 in 1958. Under the agrarian reform program, which is designed to produce a more equitable distribution of farm land, the government acquired by Sept. 30, 1958, 1,977,000 acres, of which 1,507,000 acres were assigned to 108,000 families.

Fund for the South.—From its inception in 1950 through Dec. 31, 1958, the Fund for the South (Cassa per il Mezzogiorno), a 15-year program for the rehabilitation of depressed areas in southern Italy, Sicily, and Sardinia, approved 118,000 proj-

ects costing a total of 1,035 billion lire. About 9,000 of these were public projects (795 billion lire), and 109,000 were private projects (240 billion). Projects completed by the fund at that date cost 350 billion lire and provided 160 million work-days.

On April 22, 1959, the fund borrowed $30 million on the United States investment market, with repayment guaranteed by the Italian government. At the same time, the IBRD and the European Investment Bank (EIB) entered into agreements with the fund whereby each would lend it up to $20 million. (The IBRD had previously granted five loans, aggregating $239,628,000, to the fund.)

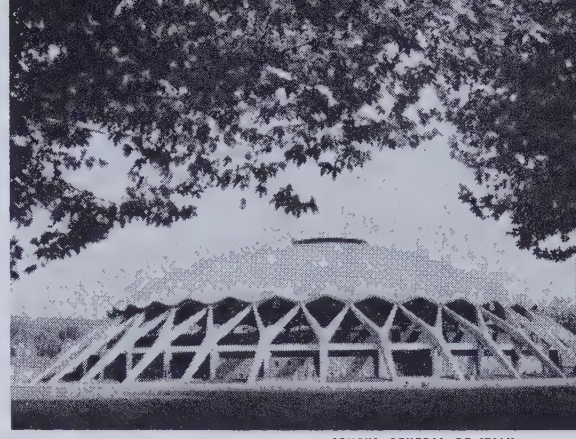
Foreign Trade.—In 1958 imports were valued at 1,980,595 million lire, and exports at 1,585,154 million, leaving a deficit of 395,441 million, as compared with a deficit of 702,427 million in 1957. For the first half of 1959 imports were valued at 997,044 million lire, and exports at 794,493 million, producing a deficit of 202,551 million.

In 1958 there were substantial reductions in imports of wheat, cotton, wool, lumber, coal, fatty oils, and brass. At the same time, there were large increases in exports of automobiles, chemical products, petroleum, and steel products. While imports from countries in the sterling area rose, those from France, West Germany, the United States, and the USSR declined markedly. Exports to Egypt, Venezuela, West Germany, and the United Kingdom increased, and those to France, Spain, and the USSR decreased. Imports from the United States declined by 24.8%, while exports to it increased by 6.8%.

Italy's official gold and foreign exchange holdings rose from $1,532 million on Dec. 31, 1957, to $2,321 million on Dec. 31, 1958, and to $2,829 million by June 30, 1959. A total of 15,287,037 tourists entered Italy in 1958, as compared with 14,629,020 in 1957. The largest percentages came from West Germany (25), Austria (15), Switzerland (14), France (10), England (7.5), and the United States (5).

Principal Events, 1959. *Political Developments.*—As a result of a split in the governing coalition, Premier Amintore Fanfani handed his government's resignation to President Giovanni Gronchi on January 26. Antonio Segni, also a Christian Democrat and a former premier, was invited to form a new government. He and his cabinet, which was composed entirely of Christian Democrats, were sworn in by the president on February 16. On February 24, Premier Segni presented the new government's program to the Chamber of Deputies and Senate. It included: (1) furtherance of economic progress with the immediate aims of overcoming the current recession and of reducing unemployment; (2) adherence to principles of cooperation with other North Atlantic and western European countries and dedication to Western solidarity; (3) continuation of friendship and collaboration with Somaliland; (4) growth of close trade and cultural relations with other Mediterranean countries; and (5) resistance to Austrian demands for greater autonomy for the German-speaking population of the South Tirol (Alto Adige). This program was approved by the Chamber on February 27, by a vote of 333 to 248, with 1 abstention; and by the Senate on March 6, by a vote of 143 to 97.

Meanwhile, on January 31, Fanfani also resigned his position as secretary of the Christian Democratic Party, since it had become evident that his leftist views clashed with those of the majority, and especially of the right-wing Roman Catholic deputies. Italy's role in the North Atlantic Treaty Organization (NATO) became an important issue



CONSUL GENERAL OF ITALY

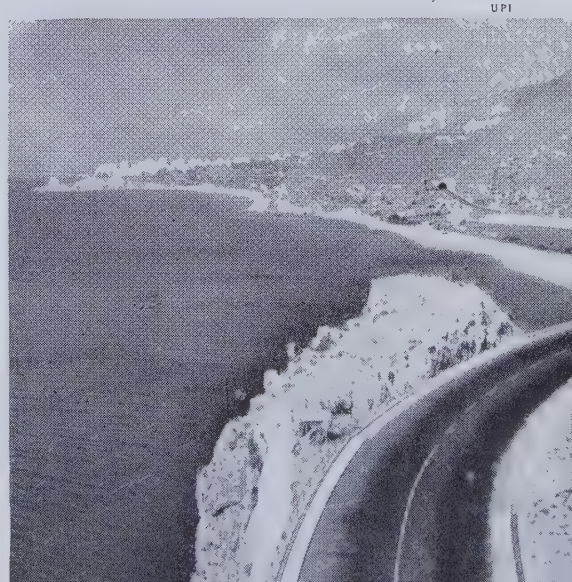
This modern sports arena, the Palazzetto dello Sport, is one of three stadiums designed by Pier Luigi Nervi for the 1960 Olympic Games in Rome. The structure is of reinforced concrete, with its roof spanning a diameter of 194 feet.

in July, when Segni's leadership was again challenged by Fanfani. While Segni was strongly pro-Western, Fanfani and his followers had neutralist leanings and favored cooperation with the left-wing Italian Socialist Party of Pietro Nenni. The rift within the Christian Democratic Party had become wider than at any time since the end of World War II, and party leaders feared that the controversy might result in a permanent schism. In the election of delegates to the 7th Congress of the party, held in Florence on October 23–29, it appeared that Fanfani's faction was gaining strength at Segni's expense. Nevertheless, when Fanfani spoke on October 27, he refrained from making the expected serious attack on the premier's regime, and in a surprisingly moderate manner reiterated his belief that the party should invite the support only of the center democratic parties. At the end of the Congress, Segni's supporters won 52 of the 90 elected seats in the party's National Council. As a result, his government was prolonged for the time being.

The situation of the other Italian parties also was confused. Meeting in Naples on January 18, the Italian Socialist Party voted by a large majority to change its policy from one of cooperation with the Communists to a closer relation with the democratic parties. On February 8, the left wing of

Opened in 1959, this section of the "Highway to the Sun" curves along the Italian coast at Sperlonga, south of Rome. When completed, the highway will be part of a system extending from Milan, through Florence and Rome, to Naples.

UPI



the Democratic Socialist Party, which favored a merger of the two Socialist parties, seceded and formed an autonomous group. In May that group joined the Italian Socialist Party. The result was to weaken the Democratic Socialists, who under Giuseppe Saragat's leadership had participated in the Fanfani government.

At a joint meeting of the Central and Control committees of the Communist Party held on March 10, a new policy was announced. The Communists urged all left-wing groups to unite as a means of defeating Premier Segni's government and of preventing the possible formation of a Gaullist regime in Italy.

On April 3, the National Monarchist and Popular Monarchist parties, which had separated in 1954, announced that they had agreed to reunite in a single party, which was given the name of the Italian Democratic Party. The National Monarchists had been allied with the Italian Social Movement (neo-Fascists), whose strength declined as a result of the new merger.

Elections.—In May and June, local and regional elections were held. The election of the regional Parliament of Valle d'Aosta, held on May 17, produced a victory for a coalition of autonomists and extreme left-wing parties, which together obtained 25 seats, as compared with 10 for the center democratic parties. A Vatican decree of April 13 had forbidden all Roman Catholics to vote for candidates or parties that collaborated with Communists, and following the election Corpus Christi processions were canceled in the diocese of Aosta.

In local elections held on May 31 and June 1, an alliance of Communists and left-wing Socialists made slight gains despite the efforts of the center parties, which were supported by the Vatican. A week later, on June 7, the Sicilians went to the polls to choose a new 90-member regional Parliament. Until October 1958, the regional government had been in accord with the central government in Rome. On October 31, however, dissident Christian Democrats headed by Silvio Milazzo, a Sicilian landowner, broke with their party and, charging "bureaucratic interference" in the island's affairs, formed a new regional government with the support of extreme left-wing and right-wing groups. In April 1959, Milazzo formed a new party, the Christian Social Union, which was disapproved by the church because of its collaboration with the Communists. Although the results of the June election indicated only minor changes, the Christian Social Union emerged as a powerful political force, holding the balance of power in the Sicilian Parliament. The distribution of seats in the new Parliament, with those of the previous Parliament in parentheses, was as follows: Christian Democrats, 34 (37); Communists, 21 (20); left-wing Socialists, 11 (10); Italian Social Movement, 9 (9); Christian Social Union, 9 (0); Monarchists, 3 (9); Liberals, 2 (3); and Democratic Socialists, 1 (2). With left-wing support, Milazzo was re-elected head of the government by the Sicilian Parliament on July 28, and on August 12 a strongly autonomist administration was elected over Christian Democratic opposition. Milazzo's government was defeated (45–44) on December 7, but on December 18 he was re-elected (50–40) to the premiership.

Foreign Affairs.—On Jan. 6–9, 1959, Premier Fanfani visited the United Arab Republic for official talks with President Gamal Abdel Nasser. A joint communiqué stressed the importance of periodic conversations to help solve problems of mutual interest and the necessity for closer economic and cultural relations between the two countries. Similar economic and cultural agreements were arrived at in talks with Premier Constantine Karamanlis of Greece (January 9–10). A visit of President Celâl Bayar of Turkey to Rome on June 8–11 also resulted in economic and cultural agreements.

The German question and East-West relations were discussed during visits by Premier Antonio Segni and Foreign Minister Pella to Paris (March 18–20) and Bonn (March 20–22). On June 23–28, President Charles de Gaulle paid a state visit to Italy during which the two countries affirmed their political and economic solidarity. The French president suggested to President Gronchi a plan for a security alliance in the western Mediterranean. East-West relations were also the topic of discussion when Segni and Pella paid an official visit to London on December 1–3.

Announcement was made on March 30 that Italy and the United States had reached agreement on the establishment of a missile base on Italian soil. The agreement was approved by the Italian Senate on April 17 by a vote of 133 to 87, and a Soviet note of protest (April 28) was rejected on May 11. Premier Segni and Foreign Minister Pella had talks with President Dwight D. Eisenhower on September 3 in Paris and on September 30 in Washington. A communiqué issued on the latter date reaffirmed the close bonds of friendship between the two countries and warned that any relaxation of Western defenses was premature. On October 1, in a speech in Washington, Segni said that "a handshake and a few smiles" were not "sufficient to justify too much optimism"; he insisted on firm Soviet guarantees. His policy of Western solidarity and adherence to NATO was endorsed overwhelmingly by the Chamber of Deputies on October 16, and it was reaffirmed in talks with President Eisenhower when the latter visited Rome (December 4–6) on his 11-nation tour.

Relations with Austria deteriorated in 1959 because of the demands for greater autonomy by the German-speaking population of the South Tirol. Addressing the U.N. General Assembly on September 21, the Austrian foreign minister, Dr. Bruno Kreisky, requested that Italy create an autonomous province of Bozen (Bolzano) for the German-speaking inhabitants and said that, unless conditions improved, the matter might be put formally before the United Nations. On September 23, speaking to the assembly in his turn, Foreign Minister Pella rebuked Austria for raising a domestic question in the United Nations. He assured the assembly that Italy had granted the people of the area "a treatment the liberality of which has been exceeded in no other region of the world. . . ."

HOWARD R. MARRARO,
Professor of Italian, Columbia University.

IVORY COAST. The Republic of Ivory Coast is an autonomous republic of the French Community (q.v.), situated on the western coast of Africa near the Gulf of Guinea. Estimated area, 124,503 square miles; pop. (est. 1958), 3,090,000, including (in 1956) 11,638 nonindigenous persons, mainly French. French is the official language. Chief cities are Abidjan, the capital (est. pop., 127,000), and Bouaké (30,800).

Government.—A former French overseas territory included within the federation of French West Africa (q.v.), Ivory Coast chose the status of a member state of the French Community on Dec. 4, 1958. As an autonomous republic, Ivory Coast has self-rule in domestic affairs, with the Community exercising control of foreign relations, defense, currency, strategic minerals, and certain other matters. Ivory Coast adopted its constitution on March 26, 1959. The Legislative Assembly consists of 100 members elected by universal suffrage for a five-year term. The

premier is invested by a majority of the assembly. Félix Houphouët-Boigny, leader of the Union for the Economic and Social Development of the Ivory Coast (local branch of the African Democratic Rally), took office as premier on May 1, 1959.

Education and Religion.—In 1958 there were 1,012 schools with a total of 130,831 pupils (27.3% of the school-age population). Expenditure on education amounted to 2,160 million francs CFA, or about 19% of the budget. The natives are mostly animists; a small minority are Christians and there are some Moslem tribes in the north.

Finance.—The ordinary budget for 1958 totaled 10,294 million francs CFA; the extraordinary budget, 1,492 million (the franc CFA equals 2 metropolitan francs). In the period 1947–57, funds granted by France under the Economic and Social Investment Development Fund (FIDES) were equivalent to $109 million.

Transportation.—The republic's only railroad runs from the southern port of Abidjan to the northern border and on into Upper Volta; the length within Ivory Coast is about 388 miles. Roads and trails total 10,470 (1956), including 984 miles of highways. The principal airport is at Abidjan and handles international traffic.

Production.—Ivory Coast is the richest of the former territories of French West Africa by virtue of her cash crops, which include coffee, cocoa beans, bananas, palm kernels, and cotton. Subsistence crops are chiefly maize (corn), rice, manioc, millet, yams, peanuts, and tropical nuts and fruits. The thick forests yield mahogany, rubber, and other forest products. Cattle, sheep, and goats are raised in the interior highlands. Diamonds and manganese ore are mined on a small scale.

Foreign Trade.—Exports in 1958 totaled 31,492 million francs CFA; imports, 22,827 million. Chief exports were green coffee, 112,505 metric tons (18,780 million francs CFA); cocoa beans, 46,333 (6,415 million); hardwoods, 402,178 (3,316 million); and fresh bananas, 46,129 (1,274 million). France purchased about 60% of exports and provided 63% of imports.

Principal Events, 1959.—In the elections of April 12, 1959, Félix Houphouët-Boigny's Union for the Economic and Social Development of the Ivory Coast won all 100 seats in the Legislative Assembly. None of the seats was contested, however, since the opposition leader, Camille Adam, had been expelled from the Ivory Coast in 1958. Houphouët-Boigny, who had spent considerable time in Paris as a member of the French cabinet, took office as premier on May 1. The premier is noted for his espousal of close French ties and has played a dominant role in the opposition to the federation movement among the new African republics of the French Community. During a visit to the United States, Houphouët-Boigny conferred with President Eisenhower in Washington on November 12, declaring to the president that the African members of the French Community seek close ties with the West.

JAMAICA. See WEST INDIES FEDERATION.

JAPAN. The most advanced industrial nation in Asia, Japan is a constitutional monarchy consisting of the four main islands of Hokkaido, Honshu, Shikoku, and Kyushu and of over 3,000 smaller islands. Its total area is 142,726 square miles. Administratively, it is divided into 45 prefectures and the region of Hokkaido, each with its own governor and legislature.

Population.—On June 30, 1959, Japan's population was estimated at 92,740,000, or 980,000 more than a year earlier. The population density of 650 persons per square mile is one of the highest in the world. The birth rate, which had dropped steadily in the post-World War II period to a low of 17.2 per 1,000 in 1957, rose to 18.0 in 1958, while the death rate continued to decline, dropping from 8.3 to 7.5 per 1,000.

On Oct. 1, 1959, the population of Greater Tokyo, which claims to be the world's largest city, was 9,102,929. Populations of other major cities were as follows as of October 1958: Osaka, 2,808,000; Nagoya, 1,459,000; Yokohama, 1,254,000; Kyoto, 1,242,000; and Kobe, 1,062,000.

Government.—Under the 1947 constitution executive power rests with the prime minister, elected by the national Diet or Parliament, and his cabinet. The Diet is divided into a lower house, the House of Representatives, whose 467 members are elected every 4 years unless the Diet has been previously dissolved; and an upper house, the House of Councilors, half of whose 250 members are elected every 3 years, partly from prefecturewide constituencies and partly from the nation as a whole. Lower house elections were held on May 22, 1958, and upper house elections on June 2, 1959.

The powers of Emperor Hirohito are restricted largely to ceremonial functions. On April 10, 1959, Crown Prince Akihito was married to Michiko Shoda, daughter of a businessman. (See also below, *Domestic Affairs, 1959.*)

Defense.—In May 1959, Japan's self-defense forces, as the armed forces are known, comprised a ground force of 162,000 men, a maritime force of 27,667 men and 402 ships, and an air force of 33,225 men and 1,064 planes. The defense budget for the fiscal year ending March 31, 1960, totaled 154 billion yen (U.S.$1 = 360 yen), including an 18 billion yen contribution to the support of United States forces, compared with 146 billion yen in the previous fiscal year.

Education.—Education is compulsory for 6 years of elementary school and 3 years of junior high school. As of May 1, 1959, there were 13,374,700 students in 26,916 elementary schools. 5,180,319 students in 13,135 junior high schools, 3,216,152 students in 4,615 senior high schools, and 597,698 students in 239 colleges and universities.

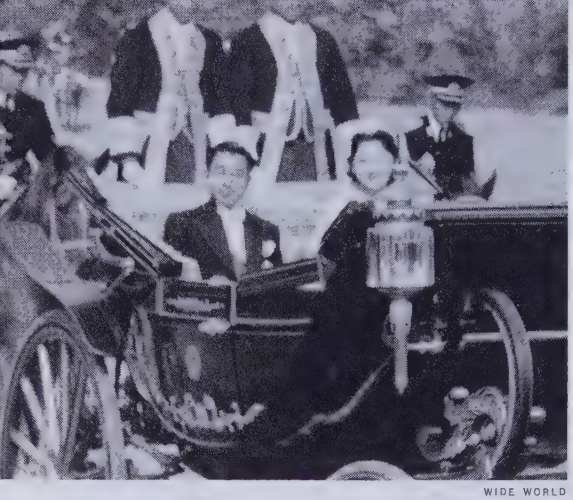
Religion.—Buddhism and Shintō are the dominant religions. Many Japanese believe in both, and in December 1958 the number of Shintoists was reported to be 76,844,827, and that of Buddhists 48,974,838; Christians numbered 652,518.

Transportation and Communications.—In April 1959 there were 12,647 miles of national railway lines and 4,658 miles of private lines. A major achievement as part of a long-range railway improvement plan was the completion on June 15, 1959, of the Mikuni Tunnel shortening the distance between Tokyo and Niigata by 44 miles. In March 1958 there were 90,936 miles of roads. Construction was under way in 1959 on Japan's first high-speed highway, connecting Nagoya and Kobe. As of March 1959, registered motor vehicles included 1,026,617 trucks, 935,641 motorcycles, 245,882 passenger cars, and 117,789 buses.

Japanese airlines carried 568,392 domestic and 65,244 international passengers in 1958. In April 1959 the merchant fleet included 1,723 vessels of 5,430,000 gross tons.

There were 3,886,327 telephones in March 1958. As of July 1, 1959, there were an estimated 3,300,000 television sets and 16,500,000 radio sets served by 75 television and 313 radio stations. Newspaper circulation in 1958 was estimated at 24,329,000.

Economic Conditions.—By the end of 1958 the Japanese economy had fully recovered from a short recession, and it continued to surge ahead throughout 1959. The index of industrial productio (1955 = 100) rose from 139.7 in June 1958 to 176.6 in June 1959. National income for the fiscal year 1958 totaled 8,471 billion yen, as compared with 8,341 billion yen in the previous fiscal year. The wholesale price index (1952 = 100), which



WIDE WORLD

Crown Prince Akihito of Japan and his bride, Princess Michiko, ride through Tokyo following their wedding, April 10.

had remained almost stable for a year, increasing from 97.9 in June 1958 to 98.5 in June 1959, rose to 99.7 by August 1959. In the same month the consumer price index (1955 = 100), which had averaged 103 in 1958, rose to 107.1. Currency in circulation increased from 701.2 billion yen on June 30, 1958, to 788.3 billion yen in June 1959.

The national budget for the 1959–60 fiscal year was 1,419 billion yen, as compared with 1,312 billion yen for 1958–59, but the total was expected to be increased by a supplementary budget for typhoon relief. Between Jan. 1 and Nov. 12, 1959, Japan received credits totaling $54 million from the International Bank for Reconstruction and Development, to be used for electric power and steel development; and $33 million from the Export-Import Bank of Washington, including $30 million of cotton credits.

Production.—Electric power production in 1958 aggregated 83,103 million kw.-hr., as compared with 79,545 million in 1957. Of the total, 58,122 million were produced in hydroelectric plants. In the first half of 1959 production totaled 41,877 million kw.-hr. Coal production declined from 51.7 million metric tons in 1957 to 49.7 million tons in 1958, as many industries continued to switch from coal to other sources of energy. Production in the first half of 1959 totaled 23.4 million tons, as compared with 24.3 million in the first half of 1958. The output of refined petroleum increased from 6,963,000 kiloliters in the first half of 1958 to 9,042,000 kiloliters in the first half of 1959; production for the full year 1958 was 15,112,000 kiloliters.

In 1958, 8,765,000 metric tons of finished steel were produced, or slightly less than the 1957 output of 8,885,000 tons, but in the first half of 1959 production rose to 5,101,000 tons, as compared with 4,281,000 tons in the first half of 1958. Japan led the world in ship launchings in 1958, with 2,066,669 gross tons. Production of other goods in the first half of 1959, with production for the full year 1958 in parentheses, was as follows: cotton yarn, 226,100 metric tons (433,000); cotton fabrics, 1,350 million square meters (2,640 million); rayon staple, 124,410 metric tons (241,680); and cement, 7,926,000 metric tons (14,988,000).

Japan expected to enjoy its largest rice crop in history in 1959, with production estimated at 12,399,000 metric tons on December 5 (in 1958, 10,914,000 tons were produced). The wheat crop totaled 1,412,000 metric tons, as compared with 1,281,000 tons in 1958. The output of common barley was 1,241,000 metric tons (1,132,000 in 1958); that of naked barley, 1,164,000 metric tons (1,229,000 in 1958); and that of soybeans, 15,708,000 bushels (14,374,000 in 1958). In 1958, 164,438,000 pounds of tea and 330,500 bales (132 pounds each) of raw silk were produced. The fish catch was 5,670,000 metric tons in 1958.

Foreign Trade.—During 1958, Japan checked the drain on its foreign exchange by means of a tight monetary policy and a drastic reduction in imports, which decreased from $4,284 million in 1957 to $3,033 million; exports rose from $2,858 million to $2,877 million in the same period. Special dollar receipts, derived largely from spending by United States forces in Japan and procurement in Japan with funds of the International Cooperation Administration, amounted to $484 million in 1958, as compared with $548 million in 1957. Foreign exchange reserves continued to rise in 1959, reaching a record $1,250 million at the end of October.

In the first half of 1959 exports attained a record $1,542 million, or 10.8% above the $1,391 million of the first half of 1958, while imports increased by 10%, from $1,579 million to $1,736 million. Principal exports (in millions) for the first half of 1959, with figures for the full year 1958 in parentheses, were machinery, $358.1 ($627.4); ships, $178.8 ($331.8); cotton fabrics, $130.9 ($277.0); iron and steel products, $116.2 ($249.9); pharmaceuticals and chemicals, $89.2 ($137.8); clothing, $86.4 ($148.9); and fish and fish products, $67.9 ($171.1). Major imports (in millions) included petroleum and petroleum products, $217.5 ($411.7); machinery, $202.1 (341.3); raw cotton, $182.4 ($360.9); pharmaceuticals and chemicals, $103.3 ($166.3); raw wool, $101.9 ($194.3); and wheat, $77.5 ($154.2).

As in past years, the United States was Japan's chief trading partner in 1958, taking 23.6% of its exports and providing 34.8% of its imports. Japan's leading customers (in millions) for the first half of 1959, with figures for the full year 1958 in parentheses, were the United States, $447.3 ($680.4); Liberia (mostly ships), $116.2 ($236.7); Hong Kong, $54.1 ($100.1); Canada, $52.6 ($76.3); the Philippines, $50.2 ($89.5); and Thailand, $49.4 ($83.8). The principal sources of imports were the United States, $560.3 ($1,053.9); Saudi Arabia, $123.4 ($144.8); Malaya and Singapore, $76.5 ($127.1); Australia, $136.3 ($225.6); Canada, $70.6 ($123.4); the Philippines, $63.2 ($99.8); and Mexico, $55.7 ($93.6).

Domestic Affairs, 1959. *Political Developments.*—The overwhelming victory of the leading Liberal-Democratic Party (LDP) in both upper house and local elections and a split in the Socialist Party (JSP) were the principal political events of 1959. Prime Minister Nobusuke Kishi's leadership of the LDP was confirmed on January 24 at a special party convention, which re-elected him to a two-year term as party president by a vote of 320 to 166 over Kenzo Matsumura. Earlier, on January 12, Kishi had reshuffled the top LDP posts and filled several cabinet vacancies. Takeo Fukuda was named secretary general of the party; Shuji Masutani, chairman of the Executive Board; Umakichi Nakamura, chairman of the Policy Board; and Shigejiro Ino, director general of the Defense Agency.

The 31st regular Diet session reopened on January 26 after a holiday recess. The first of several clashes between the LDP and the Socialists developed over a JSP draft resolution that Japan would never arm itself with nuclear weapons. When the LDP refused to cosponsor the measure, the Socialists boycotted proceedings for one day. On February 19, the JSP left the Diet for five days

because it objected to the government's handling of a minimum-wage bill. This measure, which provided for a series of minimum-wage agreements either by area or by industry, was passed (234–126) by the lower house on February 25 and enacted into law on April 7. On March 28 the lower house defeated (253–142) a Socialist motion of nonconfidence in Prime Minister Kishi. The motion attacked Kishi's handling of negotiations on the United States–Japan Security Treaty and relations with Communist China (see below, *Foreign Affairs, 1959*) and charged the government with scandal in connection with the Philippine and Indonesian reparations agreements.

The session was shorter than usual because of a lengthy recess during the wedding of the crown prince and the local elections (see below), and because of the need to adjourn by the expiration (May 2) of the terms of half of the members of the upper house. Besides the minimum-wage bill and the budget, which was adopted on March 31, important measures included a national annuity bill, a bill expanding the national insurance system, revision of the Social Education Law, and two defense bills adopted on the closing day, May 2, providing for small increases in the armed forces.

The wedding of Crown Prince Akihito on April 10 was celebrated as a jubilant national holiday and attracted worldwide attention. A series of local elections, on April 23 and April 30, for 19 governors, prefectural assemblymen, mayors, and other local offices resulted in a conservative sweep. The LDP had already won 10 consecutive gubernatorial contests between January and April, and on April 23 it captured all but 2 of the 10 posts contested by the JSP. Its most significant victories were those of Ryutaro Azuma in Tokyo, Gisen Sato in Osaka, and Kingo Machimura in Hokkaido. Of 2,657 prefectural assembly seats, the LDP won 1,593; the JSP, 561; and independents, 419 (the balance went to minor parties).

Local issues were of major importance in most of these elections. In the June 2 upper house election and in the major gubernatorial contests, however, the JSP stressed foreign relations, while the LDP stood on its constructive legislative record and charged the Socialists with subservience to the pro-Communist trade union federation, Sohyo (General Council of Japanese Trade Unions). At stake in the upper house were 75 seats from local constituencies and 52 (including 2 vacancies) from the nation as a whole. The LDP made an unexpectedly strong showing, increasing the number of its seats from 127 to 132 and raising its percentage of the popular vote from 48.4 in 1956 to 52.0 in 1959, while that of the JSP dropped from 38.0 to 34.1. Only 1 Communist was elected by a slim margin in the national constituency, but 6 representatives of Soka Gakkai, a religious organization, were elected as independents. The voting rate was 58.7%, as compared with 61.2% in 1956. The accompanying table shows the composition of the upper house before and after the 1959 election and as of December 1959, as well as that of the lower house on the latter date.

Bolstered by this new mandate from the people, Kishi reorganized his cabinet on June 18. Foreign Minister Aiichiro Fujiyama and Finance Minister Eisaku Sato retained their posts, but all other ministers were replaced. Major posts were filled as follows: Shuji Masutani, deputy prime minister; Hayato Ikeda, international trade and industry; Munenori Akagi, defense; and Takeo Fukuda, agriculture and forestry. At the same time, Bamboku Ono was renamed deputy president of the LDP; Mitsujiro Ishii, chairman of its Executive Board; Shojiro Kawashima, secretary general; and Naka Funada, chairman of the Policy Affairs Research Committee. The 32d extraordinary Diet session (June 22–July 3) confined itself to organization (the LDP filled all vacant committee chairmanships in the upper house over JSP protests) and passage of a bill to increase the personnel in a number of ministries.

[1] Green Breeze Society, a conservative party existing only in the upper house.

In a startling decision on March 30, the Tokyo District Court had acquitted seven defendants charged with illegal entry into the U.S. Air Force base at Tachikawa in 1957, declaring that the presence of United States forces in Japan was unconstitutional. The prosecution appealed the decision to the Supreme Court, which ruled on December 16 that there was no conflict with the constitution and ordered a retrial of the case.

One of the most significant political developments in recent years was the decision of a group of right-wing Socialists under the leadership of Suehiro Nishio to leave the JSP because of dissatisfaction with its failure to adhere to democratic parliamentary methods and with its tendency to adopt pro-Communist policies. The split occurred in the midst of the JSP annual convention, held on September 12–16. Unable to complete its business, the convention recessed until October 16–17, when new officers were elected. All except the secretary general were from the party's left wing. Mosaburo Suzuki and Inejiro Asanuma were reelected chairman and secretary general, respectively. The Nishio group announced plans to form

Supplies are dropped by air on Nagoya in the wake of typhoon Vera, which struck central Honshu on September 26–27. More than 4,400 died in the worst storm in Japan's history.

EUROPEAN

a new party at the beginning of 1960. Meanwhile, on October 18, 33 Diet members of the group resigned from the JSP and formed a separate Socialist Club in the Diet. On November 25, they were joined by an additional group of right-wing Socialists, who formed themselves in the Diet as the Democratic Socialist Club.

On September 26–27, central Japan, particularly Aichi, Mie, and Gifu prefectures, was struck by typhoon Vera, leaving in its wake the greatest human loss and material damage of any typhoon in recorded history. Over 5,000 persons were dead or missing, and 500,000 homes were flooded or destroyed. The major business of the 33d extraordinary Diet session, which convened on October 26, was to pass a supplementary budget providing relief for victims of this disaster as well as for those of typhoon Georgia, which had taken a toll of 274 lives on August 14.

The Diet grounds were the scene on November 27 of violent demonstrations by 20,000 left-wing students and union members against the United States–Japan Security Treaty. Over 500 persons were injured, and the LDP drew up a bill prohibiting such demonstrations near the Supreme Court and Diet buildings.

Communism.—Communist Party (JCP) prestige remained low in 1959, and the party received only 1.9% of the popular vote in the national constituency in the upper house election. However, it participated in many front organizations and, with Sohyo and the JSP, played a leading role in organizing rallies against the security treaty. On July 28 the LDP exposed the World Conference Against Atomic and Hydrogen Bombs as being Communist dominated, and declared that 7 of its 34 directors were Communists. On August 10 the Supreme Court ordered a retrial, on grounds of insufficient evidence, of Communists accused of derailing a train in 1949.

Labor.—Of the 7,000,000 members of organized labor in Japan, 3,597,000 belonged to Sohyo and 779,000 to Zenro (Japanese Trade Union Council) in June 1959. Talks to merge the two federations began in January, but were broken off at Zenro initiative on August 18. Under pressure from pro-Communist elements, Sohyo's annual convention rejected on August 26 a resolution to support the JSP and instead took no stand on political support.

Labor unrest in 1959 centered on the depressed coal industry. A two-week strike against 14 companies began on March 23, and there were further strikes later in the year. A major achievement for labor was a minimum-wage agreement obtained by a Zenro affiliate, the Textile Workers Union, on August 23. It provided for a minimum wage of 6,000 yen for workers 15 years old and one of 8,000 yen for those 18 years old.

Foreign Affairs, 1959.—During the year, Japan continued to cooperate closely with the United States and other countries of the free world. A blue book on Japanese foreign policy, issued in May, stated: "It is clear that this country cannot survive independently as a free and democratic nation by taking a neutral stand under present world conditions." From July 11 to August 11, Prime Minister Kishi traveled to Great Britain, West Germany, France, Austria, Italy, Brazil, Argentina, Chile, and Mexico to strengthen Japan's ties with these nations.

United States.—Negotiations on the revision of the United States–Japan Security Treaty of 1951 and the accompanying administrative agreement were continued in Tokyo between Ambassador Douglas MacArthur II and Foreign Minister Fujiyama. The original treaty was drawn up while Japan was still under occupation, and a major objective of the revision was to clarify the fact that relations between the two countries were on an equal footing and to define the relation of the treaty to the U.N. Charter, while taking into full account the requirements of the Japanese Constitution. As explained by Fujiyama in a report to the Diet on November 10, the government was convinced that the tendency to attempt settlement of problems through talks among the major powers had not diminished the need for a stable collective security system among the nations of the free world. The signing of the new treaty was attended by Prime Minister Kishi in Washington on Jan. 19, 1960.

Fujiyama took advantage of his attendance at the opening of the 14th session of the U.N. General Assembly in New York to have a helpful exchange of views with Secretary of State Christian A. Herter on September 23. A tuna conference of the two governments, held in Tokyo on September 30–October 2, discussed mutual conservation measures and marketing problems in an effort to meet the objections of United States tuna fleets to Japanese inroads into the American market.

Korea.—On January 30, Foreign Minister Fujiyama announced that Japan would ask the International Committee of the Red Cross to supervise a program whereby Korean residents in Japan could return voluntarily either to North Korea or to South Korea, and this decision was confirmed by the cabinet on February 13. On April 13, talks opened in Geneva between representatives of the Japanese and North Korean Red Cross societies, and an agreement on repatriation procedures was signed by the two bodies in Calcutta on August 13. Registration of residents wishing to go to North Korea, which began on September 21, was hampered by demands for procedural changes by the North Korean Residents Association. After the government and the Japanese Red Cross Society had acceded to some of the changes, the number of registrants increased to about 5,000 by November 15. Delegates of the International Committee of the Red Cross were to assure that no coercion was exerted on repatriates in deciding whether to remain in Japan or to leave. The first repatriation ships sailed on December 14.

The Republic of Korea reacted violently to the repatriation plan, claiming that the repatriates were being sent into "Communist slavery," and on June 15 it announced that it was suspending trade with Japan. Nevertheless, it agreed on July 30 to resume discussions with Japan on a large number of unsettled problems, including the exchange of Japanese fishermen seized by Korea and illegal Korean immigrants held by the Japanese.

USSR.—The Soviet Union took an especially tough position in fishery negotiations that lasted from January 12 to May 13, 1959. The final agreement permitted Japan to take 85,000 tons of salmon, or about half of the Japanese demand and 23% less than the 1958 quota. Exploiting controversy within Japan over the security treaty revision, the USSR also conducted a vigorous campaign to encourage Japanese neutralism. On April 21, in a move apparently timed to exert influence on the elections, Premier Nikita S. Khrushchev sent a letter to the pro-Communist Japan Press Service in which he urged Japan to support a policy of neutrality. A Soviet note of May 4 warned Japan against the introduction of nuclear weapons. In its reply of May 15, Japan firmly rejected this "intervention in its domestic affairs."

Communist China.—A series of missions to Communist China in 1959 failed to break the stalemate that had prevailed since the Chinese

broke off trade relations with Japan in May 1958. A Sohyo mission in February obtained Communist Chinese permission to import a small amount of much-needed lacquer, but this niggardly gesture aroused more criticism than gratitude. Secretary General Asanuma, heading a JSP delegation, made a visit to Peking on March 4–23, in the course of which he said that "the United States is the common enemy of Japan and Communist China." This statement was roundly criticized in Japan and probably hurt the JSP in the elections. Delegations in the autumn, headed by former LDP Prime Minister Tanzan Ishibashi, former JSP Prime Minister Tetsu Katayama, and LDP leader Kenzo Matsumura, had little effect on Chinese policy.

Other Countries.—On May 13, 1959, Foreign Minister Fujiyama signed in Saigon an agreement with South Vietnam that provided for $39 million in outright reparations, $7.5 million in a three-year loan for power projects, and $9.1 million in loans and credits on a private basis for a fertilizer plant. The agreement was approved by the Diet on December 23.

Japan's membership in the U.N. Security Council expired at the end of 1959, but on October 13 it was elected to the Economic and Social Council, and a Japanese delegate served on the investigating team sent to Laos. The 15th session of the contracting parties to the General Agreement on Tariffs and Trade, which met in Tokyo on October 26–November 20, was the largest intergovernmental conference ever held in Japan.

JEHOVAH'S WITNESSES. Preaching by these Christians began in the 1870's; their legal agency, the Watch Tower Bible and Tract Society of Pennsylvania, was incorporated in 1884. The group's headquarters are located at 124 Columbia Heights, Brooklyn 1, N.Y., and branch offices are maintained in 85 countries.

During 1959 a total of 871,737 ministers (adherents) preached in 175 lands. Organized into 19,982 congregations, these ministers meet five times weekly to study and train for their ministerial work. During 1959 they spent more than 126,317,124 hours preaching; placed more than 15,424,294 Bibles and study books; distributed over 92,310,778 copies of *The Watchtower*, which is published in 54 languages, and *Awake!*, which is published in 19 languages; and conducted more than 606,075 weekly Bible studies in the homes of interested persons. In the last ten years more than 188,148,000 books and booklets (not including magazines) in 128 languages and dialects have been distributed.

A new branch office and printing plant were opened in England in 1959, with additional printing operations extending to Canada and South Africa. In Laos and Cambodia, despite unsettled internal conditions, preaching activity was carried on for the first time. In Communist countries, continuing arrests and persecution were marked by intensified opposition to Jehovah's Witnesses in the Soviet press.

On Jan. 27, 1959, in a 6–3 decision, the Supreme Court of Canada decided in favor of two Jehovah's Witnesses for alleged violations of their civil rights.[1]

President, Watch Tower Bible and Tract Society of Pennsylvania.

JET PROPULSION. See Index entry.

JEWELRY. United States consumers spent slightly less than $3 billion on jewelry of all kinds (including watches and clocks) in 1958—about 6% less than in the record year of 1957. Preliminary estimates of sales for 1959 indicate a possible gross of $3.3 billion, based on a substantial increase in diamond sales and slight increases in the sale of watches and other jewelry.

The retail value of world diamond production in 1958 was $830,267,392, down about $460,000,000 from the 1957 figure ($1,289,771,478). International diamond producers report that the United States, long the principal market for both gem and industrial diamonds, currently receives 95% of all diamonds produced.

For the first 6 months of 1959, the retail sales value of gem diamonds graded in the rough amounted to $515,367,432, an increase of 44% over the same period in 1958. Diamond producers expected record sales for 1959, with continuing high sales in the second half of the year.

Sales of industrial diamonds amounted to $40,656,390 in the first 6 months of 1959, 82% higher than sales for the same period in 1958. The marked increase in sales of natural industrial diamonds in 1959 is believed to indicate that synthetic diamonds (marketed since 1957) have not made the serious inroads at first thought possible.

Outstanding developments in jewelry styling in 1959 included designs for women's wrist watches (see also WATCHMAKING) in which handsome bracelets completely conceal the timepieces, and the further development of diamonds colored artificially by irradiation in a cyclotron.

JEWISH AFFAIRS. During late 1958 and the year 1959, the Jewish migration of the past few years steadily decreased. Emigration from Rumania stopped; there was only a limited flow from Poland to Israel; and emigration from Egypt involved mostly cases of family reunion. There was therefore no substantial change in the geographic distribution of world Jewish population, with the total estimated at about 12,200,000. Of these, about 6,180,000, or more than one half, were in North, Central, and South America. Europe had 3,440,000; Asia, 1,970,000; Africa, 550,000; and Australia–New Zealand, 68,000.

Europe had about 3,440,000 Jews—approximately 2,000,000 in the Soviet Union and some 390,000 in countries of the Soviet bloc, of which Rumania (with 220,000) and Hungary (with some 100,000) were the two largest. Western Europe had approximately 1,000,000—mainly in England (450,000) and France (350,000). Germany had about 30,000 Jews; the Jewish repatria-

[1] In the first instance, the late Maurice Duplessis, former premier of Quebec, was ordered to pay $33,123 and costs to restaurateur Frank Roncarelli because in 1946 Duplessis unjustifiably revoked Roncarelli's permit to sell liquor. The premier's action, taken after Roncarelli had signed bonds to effect the release of arrested Witnesses, was, in the language of the court, ". . . a punishment which inflicted on him [Roncarelli], as it was intended to do, the destruction of his economic life. . . ." In the second instance, Louise Lamb was awarded $2,500, plus costs, for false arrest by a Verdun, Quebec, police official in 1946.

tion to that country showed a considerable decrease, with the number of returnees at the lowest figure since 1952.

The Jewish population of the United States was about 5,520,000, of whom 2,300,000 resided in the New York metropolitan area, 400,000 in Los Angeles, and 331,000 in Philadelphia. There were 250,000 Jews in Canada and 680,000 in Latin America (some 400,000 of them in Argentina). Israel, with 1,837,000, had the largest Jewish population outside of the United States and the USSR.

There was continued anxiety over the status of the Jewish community in the Soviet Union, which lived under a regime of discrimination and oppression. In spite of Soviet official denials, the evidence was incontrovertible that Jews were deprived of cultural, religious, and educational facilities, as well as the right to communicate with coreligionists in Western countries. An increasing number of their synagogues were closed, and prayer meetings, ceremonials, and cultural institutions forbidden.

In 1959 the Canadian Jewish community celebrated its 200th anniversary. This marked the third major anniversary celebration of an English-speaking Jewish settlement in the past five years, having been preceded by American Jewry's 300th year in 1954 and British Jewry's 300th year in 1956. In France, the Jews celebrated in 1958 the 150th anniversary of the establishment by Napoleon I of the Consistoire, the official religious representative body.

One of the concerns of the Jewish communities of the western European countries continued to be the rebuilding of Jewish religious and cultural institutions and the development of educational programs that would help bring Jewish youth back to Judaism. Toward this objective considerable aid was received from the Conference on Jewish Material Claims against Germany, the agency distributing funds received as a result of the 1952 agreement with West Germany which provided for collective German indemnity in redress of Nazi wrongs. The Claims Conference, in its five-year summary, reported the distribution of almost $50 million on relief and rehabilitation, cultural and educational reconstruction, commemoration and documentation projects, and legal aid programs. Each year these funds aided about 100,000 individuals in 35 countries and about 200 communities. To a considerable extent, Claims Conference grants to many European war-devastated communities have made continued Jewish communal existence possible.

In the United States the Jewish community provided funds and services through a whole complex of agencies—national and local—set up to meet health, welfare, recreational, religious, cultural, community relations, and educational needs, as well as to assist needy Jews overseas. Federated philanthropic agencies, that is, the central Jewish welfare funds affiliated with the Council of Jewish Federations and Welfare Funds (CJFWF), raised approximately $130 million in 1959, compared with $124 in 1958, or a rise of 6.6%. In addition, approximately $50 million was raised independently in 1958.

The United Jewish Appeal (UJA) and the American Joint Distribution Committee (JDC) were the principal agencies conducting programs of fund-raising and relief on behalf of Jews in Israel and other countries. The major coordinating agencies furnishing national services were: National Jewish Welfare Board (service to Jewish community centers and Jewish military personnel), American Association for Jewish Education (service to local bureaus of Jewish education), the Synagogue Council of America (representative body of synagogue and rabbinical organizations), National Community Relations Advisory Council (service to local as well as national community relations groups), and the Council of Jewish Federations and Welfare Funds. Among the major membership agencies offering specialized programs in the Jewish community were: American Jewish Committee (intergroup and community relations), B'nai B'rith (largest Jewish fraternal order), Hadassah (women's Zionist organization), National Council of Jewish Women (membership and civic activity), and the National Jewish Hospital and City of Hope (health). (For discussion of other agencies, see RELIGION—*Judaism.*)

In 1958–59 the CJFWF completed a study of national cultural programs. Its survey report, released in November, recommended the establishment of a Jewish Cultural Foundation "to serve as a focus of the national cultural effort," and the establishment of a Council of Jewish Cultural Agencies related to the foundation.

MORRIS FINE,
Editor, "American Jewish Year Book."

JOHN XXIII (ANGELO GIUSEPPE RONCALLI), pope of the Roman Catholic Church: b. Sotto il Monte, near Bergamo, Italy, Nov. 25, 1881. Elected the 262d supreme pontiff of the Roman Catholic Church on Oct. 28, 1958, this son of humble farm workers spent much of his life in the church as a diplomat. At various times after 1925 he represented the Vatican in Bulgaria, Turkey, and Greece; in 1944 he was sent as apostolic nuncio to France; and on Jan. 12, 1953, he was elevated to the College of Cardinals.

On Jan. 25, 1959, Pope John announced that he would call an ecumenical council, the first since 1869–70, to discuss the return of the "separated" churches to Rome. He seemed to be primarily concerned with the reunification of the Eastern Orthodox branches of Christianity with Rome.

Some observers interpreted Pope John's appointment of four new Polish bishops on Jan. 28, 1959, as a sign that the Vatican accepted Cardinal Wyszyński's relationship with the Polish Communist government as a satisfactory *modus vivendi.* He remained uncompromising, however, in his general attitude toward communism. In a statement of April 13, he forbade Roman Catholics to vote for candidates or parties that supported or gave comfort to the Communists.

He made two important pronouncements on public morals in December 1959. On December 8 he called for laws to curb the freedom of the press to print stories (particularly, detailed accounts of crime) that in the Roman church's view tend to poison religious and moral life. On December 14 he reasserted his church's condemnation of artificial methods of birth control and denounced them as a means of solving the problem of population pressure on food supplies. To deal with the problem of hunger, he recommended a better distribution of the world's wealth.

Two saints were proclaimed on April 12: Carlo of Sezze, a 17th century Franciscan mystic, and Joaquina de Vedruna de Mas, the 19th century founder of the Institute of the Carmelite Sisters of Charity. Pope John created three cardinals in March and eight more in December. The latter group included Aloisius Joseph Cardinal Muench, bishop of Fargo, N. Dak., and Albert Gregory Cardinal Meyer, archbishop of Chicago, both installed as cardinals on December 17.

(See also RELIGION—*Catholicism;* ROMAN CATHOLIC CHURCH.)

JOHNSON, Edward (80), Canadian-American opera manager and singer: b. Guelph, Ont., Aug. 22, 1878; d. Guelph, April 20, 1959. Following a highly successful career as an operatic tenor, he served from 1935 to 1950 as general director of New York City's Metropolitan Opera Association.

In 1900, after deciding on a career as a professional singer, Johnson went to New York City. He appeared as tenor soloist in church choirs, concerts, and light opera, the latter including the romantic lead in Oskar Straus' *A Waltz Dream*, which opened on Broadway in January 1908 and ran for 111 performances. In 1909 he went to Italy to study voice, notably with Vincenzo Lombardi, former teacher of Enrico Caruso. At Padua three years later, under the adopted name Eduardo di Giovanni, he made his operatic debut in Giordano's *Andrea Chénier*. He soon became one of Italy's most popular tenors, and was chosen in 1914 to sing the title role in the first Italian-language production of Wagner's *Parsifal*, at La Scala, Milan. He remained with La Scala for five years.

In 1919 Johnson returned to the United States, reassumed his real name, and joined the Chicago Opera Company. His Chicago debut was as Avito in Montemezzi's *L'amore dei tre re*, with Mary Garden as Fiora. He first appeared with the Metropolitan, again as Avito, on Nov. 16, 1922, and later as Canio, Pelléas, Faust, Romeo, and Peter Ibbetson.

In 1935 Johnson was named to succeed Herbert Witherspoon as manager at the Metropolitan. Giving up his singing career, he continued in that post until his retirement in 1950, when he was succeeded by Rudolf Bing.

During Johnson's tenure, an unprecedented number of leading American-born singers were added to the Metropolitan's roster of stars. These included (with dates of debuts) Risë Stevens (1938), Helen Traubel (1939), Leonard Warren (1939), Eleanor Steber (1940), Jan Peerce (1941), and Richard Tucker (1945).

Johnson, who became a United States citizen in 1922, was married to Beatrice da Verga d'Arneiro, a Portuguese noblewoman, in 1909. She died in 1919. Their only child, Fiorenza, became the wife of George A. Drew, premier of Ontario (1943–48) and Canadian high commissioner to the United Kingdom at the time of Johnson's death.

JOHNSON, Lyndon Baines, U.S. senator: b. near Johnson City, Texas, Aug. 27, 1908. Elected on Jan. 7, 1959, as Senate Democratic majority leader in the third consecutive Congress, Johnson at the end of the year appeared to be a leading contender for his party's presidential nomination.

After graduating from Southwest Texas State Teachers College in 1930, Johnson taught for two years in Houston's public schools, then went to Washington, D.C., as a member of the staff of Texas Congressman Richard Kleberg. He returned to Texas in 1935 to serve as state director of the National Youth Administration, resigned in 1937 to run for Congress in a special election, and won. Except for duty with the U.S. Navy in 1941–42, Johnson served continuously in the House of Representatives until 1948, when he won his seat in the Senate. He was elected majority whip in 1951 and in 1953 became, as minority leader, the youngest Senate party leader in history.

Johnson's role in 1959 was again that of moderator and strategist, guiding opposing elements within his own party in what he called "constructive opposition" and achieving with Republicans a working compromise aimed at "realistic" legislative goals. Johnson's leadership derives from the classic definition of politics as "the art of the possible," and even unfriendly critics grant his uncanny sense of what can be done and acknowledge his masterly grasp of the techniques of getting it done.

In 1959, however, a growing criticism arose from party liberals disappointed in the legislative record achieved (see UNITED STATES—*The United States in 1959*). In the opening weeks of the session, Johnson skillfully forestalled efforts to impose a rigid curb on filibustering (winning approval instead of his own milder modification of the Senate rule) and to enact more vigorous civil rights legislation. Critics in and out of Congress charged him with lack of sufficient boldness for a leader whose party controlled Congress by the largest margin since 1936 and held that his cautiousness had allowed the administration to take the initiative in exploiting its demands for economy at the expense of needed social legislation throughout the year.

House Speaker Sam Rayburn, the senator's old friend and fellow Texan, opened a "Johnson for President" drive in Dallas on October 17. At the end of the year Johnson insisted, as he had earlier, that he was not a candidate for the presidential nomination. Nevertheless he was booked to make more than 60 personal appearances in the last two months of 1959 and in December toured the Midwest delivering hard-hitting speeches to traditionally Republican audiences.

JORDAN. An Arab monarchy in southwestern Asia, the Hashemite Kingdom of Jordan is bounded on the north by the Syrian Region of the United Arab Republic (UAR), on the northeast by Iraq, on the east and south by Saudi Arabia and the Gulf of 'Aqaba, and on the west by Israel. Its area is about 37,300 square miles, of which approximately 85% is desert. The latest official estimate (mid-1958) gives a population of 1,607,000, including 517,888 Palestinian refugees, registered as of June 1957. The vast majority of the people is composed of Moslem Arabs of the Sunnite sect. There are also about 180,000 Christian Arabs; 10,000 Moslem Circassians, Chechens, and Turkomans; and a few Iranian Bahais. Amman, the capital, has a population of 202,000 (1954 est.). Jerusalem (Jordanian sector, 75,000), Nablus (45,000), Hebron, and Jericho are important cities in western Jordan. 'Aqaba, on the Gulf of 'Aqaba, an arm of the Red Sea, is the country's only port.

Government.—King Hussein I (b. Nov. 14, 1935; acceded to the throne under a regency, Aug. 11, 1952; enthroned, May 2, 1953) reigns under a constitution of the British type. The king delegates legislative authority to a cabinet responsible to the lower chamber of the legislative body. The legislature is composed of a Council of Representatives (lower chamber) of 40 members (20 from East Jordan and 20 from West Jordan), who are elected for maximum terms of four years by direct vote of adult, male citizens, and a Council of Notables (upper chamber) of 20 members, who are appointed by the king for eight-year terms. The last general elections were held on Oct. 21, 1956. Jordan is a member of the Arab League and the United Nations.

Defense.—The Jordanian Army is organized into four infantry brigade groups and one armored brigade. There is also an air force, consisting of two fighter squadrons, a training wing, and a communications flight. The small naval arm is composed of three motor-torpedo boats on the Dead Sea. The regular military establishment numbers about 20,000 men; the national guard, 30,000. The United States provides arms aid under the Mutual Security Program.

Education.—Jordan maintains a system of free public education, but school facilities are inadequate. In 1957, government schools numbered 1,206, employed 7,432 teachers, and enrolled 252,990 students. Education for refugee children is provided by the United Nations Relief and Works Agency for Palestine Refugees. There are also private and religious schools.

Finance.—The unit of currency is the Jordan dinar (JD). Jordan belongs to the sterling area, and the dinar is valued at £1, or U.S.$2.80. The monetary supply is con-

trolled by a Currency Board sitting in London; however, in 1959 the Jordanian Parliament approved the establishment of a state bank which in the future will assume the functions of issuing and managing the currency. Money in circulation on June 30, 1959, amounted to JD25.22 million, of which JD16.06 million was in currency, with the remainder in demand deposits. Eight commercial banks operate in Jordan.

Government expenditures habitually exceed local revenues. Until 1956–57, annual grants-in-aid and loans from the British Treasury permitted nearly balanced budgets. Since then, United States economic aid and monetary grants to Jordan have increased greatly. Foreign aid (principally American and British) amounted to JD22.8 million in 1958. Budget estimates for 1959–60 called for expenditures of JD38.2 million, with JD19 million for defense, JD4.3 million for the economic programs of the Development Board, JD3.9 million for education, and JD2.3 million for public security. Anticipated revenue (including foreign aid) was set at JD30.8 million, with only JD9 million derived from domestic sources. It was hoped that the deficit of JD7.4 million would be covered by increased foreign aid. During a visit to the United States in March 1959, King Hussein reportedly sought a commitment for an annual grant of $50 million to support the Jordanian budget. American allocations to Jordan in 1958–59 had amounted to about $43 million.

Transportation and Communications.—Jordan has approximately 2,500 miles of roads, of which some 1,500 are hard surfaced. The principal routes link Amman with the major cities of the country, and with the road networks of Iraq and the Syrian Region of the UAR. On June 14, 1959, it was announced that engineering surveys on a new desert highway from Amman to 'Aqaba were about to be undertaken.

The section of the old Hejaz Railway controlled by the Jordanian government is in operation from the Jordan-UAR frontier in the north to a railhead at Naqb Ashtar between Ma'an and 'Aqaba. An agreement in principle was reached during 1959 between an American firm and the director of the Hejaz Railway (representing the UAR, Jordan, and Saudi Arabia) for the long-deferred restoration of the entire Damascus-Medina line at a cost of $21 million; however, many details remained to be settled.

International airports are located at Amman and Jerusalem. The port facilities at 'Aqaba, are being expanded to reduce Jordan's dependence on the port of Beirut in Lebanon, use of which requires the transit of goods across the Syrian Region of the UAR. The oil pipeline from Dhahran in Saudi Arabia to Saida in Lebanon, operated by the Trans-Arabian Pipeline Company, a subsidiary of the Arabian-American Oil Company, crosses eastern Jordan.

The government maintains radio broadcasting services at Ramallah and Amman and operates the telephone system in conjunction with the post office. There were 15,125 telephones as of Jan. 1, 1958.

Production.—About 85% of the workers are engaged in agricultural or pastoral pursuits. The chief crops are wheat (220,000 metric tons in 1957), barley (81,000 tons), corn, millet, sesame, beans, tobacco, animal fodder, grapes, olives, figs, dates, and nuts. Goats (788,000 head in 1956), sheep (723,000 head), cattle, and donkeys are significant in the economy. A severe drought in 1958 and early 1959 damaged crop prospects for 1959 and resulted in serious losses (possibly as high as 50%) in the animal herds. Phosphate rock (294,000 metric tons in 1958), manganese, kaolin, marble, and gypsum are mined.

Statistics compiled by the Jordanian government showed that in 1958 there were 1,038 industrial establishments, employing 13,543 workers. Manufactures include cement (114,120 metric tons in 1958), cigarettes, matches, soap, olive oil, wine and spirits, canned vegetables, textiles, shoes, and furniture.

Development Program.—Since 1952 the government's economic development program has been under the supervision of the Jordan Development Board, although the board's work has been mainly limited to the fields of transportation and agriculture. Even in these areas, projects have also been undertaken by both the United States Operations Mission and the United Nations Relief and Rehabilitation Agency, as well as by various other departments of the Jordanian government, operating on a largely uncoordinated basis. The encouragement of industry has taken place chiefly through the investment of public funds in private ventures. During 1959 the Development Board established a special committee to study and coordinate the entire development program.

On Feb. 10, 1959, the United States announced a loan of $1.2 million from its Development Loan Fund to the Transjordan Electric Power Company for the renovation and expansion of the Amman power system. In April the fund granted a $2.5 million loan to the Jordan Phosphate Company to finance the expansion of its productive capacity from the current level to an annual production of 500,000 tons by 1963. During 1959 the East Ghor Canal Authority was established to administer the Yarmuk-Jordan valley irrigation project, begun in 1958 with American funds. To complete the project, additional credits of $13.5 million will be needed.

Foreign Trade.—In 1958, Jordan's chronic unfavorable balance of trade was the largest in the country's history. Exports were valued at JD3.53 million (JD5.5 million in 1957); imports amounted to JD34.03 million (JD30.5 million in 1957). The marked decline in exports resulted chiefly from the UAR's closing of Jordan's northern frontier from July to October 1958 during the Lebanese and Jordanian political crises, and from the breach in relations with Iraq following the overthrow of the Iraqi monarchy.

Principal exports in 1958 were phosphates (JD900,000), olive oil (JD60,000), fresh fruits, raw wool, skins and hides, and live animals. Major imports included petroleum products, iron and steel, cement, manufactured goods, sugar, tea, coffee, and cereals. Principal purchasers of Jordanian exports (despite the disruption of trade in the second part of the year) were the Syrian Region of the UAR, Iraq, and Lebanon. The major suppliers of Jordanian imports were Great Britain, West Germany, the United States, the Syrian Region of the UAR, Iraq, and Japan.

Jordan's trade difficulties continued into 1959, when the northern frontier was again closed by the UAR in June and July. As a result, Jordan endeavored to increase the use of the port of 'Aqaba for the export and import of goods in an effort to avoid UAR embargoes. To this end, the government designated 'Aqaba as the sole port of entry for goods of American origin. The same provision was applied to imports from most European countries.

Principal Events, 1959.—In contrast with the preceding year, 1959 was a period of relative calm in the history of Jordan. Between March 8 and May 2, King Hussein was on a world tour which took him to Formosa, the United States, Great Britain, and Iran; and later he spent the period from November 10 to December 28 on vacation in western Europe. On May 5, Prime Minister Samir al-Rifai (who had held office since May 15, 1958) resigned for reasons of health, and was replaced on May 6 by Hazza Majali, the minister of the royal court. Majali's ten-member cabinet reflected little change in the generally pro-Western orientation of the Jordanian government. On May 10 the new prime minister announced in a policy statement that Jordan would participate in no military alliances except the collective security pact of the Arab League. On June 4 he informed Parliament that Jordan's foreign policy favored neither East nor West, but that the government would vigorously fight communism at home.

Relations with the UAR remained strained despite the fact that King Hussein in an interview on Jan. 25, 1959, indicated his willingness to end the estrangement. A number of clashes took place along the Syrian frontier, and on April 23 the UAR charged that Jordanian armored cars had attacked a village two miles inside Syria. During June and

July the frontier was closed by the UAR authorities, and all rail and road traffic to and from Jordan was embargoed.

In the second half of the year, however, relations between Jordan and the UAR grew better, as the UAR's President Nasser sought to improve his position relative to the other Arab states in the face of his continuing dispute with Premier Kassem of Iraq. Efforts by the secretary-general of the Arab League to mediate between Amman and Cairo proved successful, and on July 26 the Syrian frontier was reopened. On August 16 restoration of Jordanian-UAR diplomatic relations (broken in July 1958) was announced.

That political unrest still existed in Jordan was revealed on May 21, when Maj. Gen. Sadiq Sharah, the chief of staff of the Jordanian armed forces, was arrested for plotting against the monarchy. On August 12, 18 persons, including General Sharah, were placed on trial before a military court at Amman and accused of participation in a conspiracy to establish a republic during the absence of the king from the country in the spring. King Hussein, the prosecution stated, had learned of the plot and forced General Sharah to accompany him abroad, thereby foiling the conspiracy. On August 20, General Sharah confessed his part in the abortive scheme, and on October 17 was sentenced to death.

Conditions along the Jordanian-Israeli frontier were generally quiet during 1959. However, on January 26 an Israeli soldier was killed in Jerusalem by Jordanian gunfire, and on April 14 an Israeli night watchman was murdered, apparently by marauders from Jordan.

The attitude of the Jordanian government toward the Palestine problem showed no change during the year. On May 17, Premier Majali told a delegation that his government would do everything possible to restore usurped Arab rights in Palestine. On September 23 the Jordanian delegate to the U.N. General Assembly, speaking in the general debate on the Suez Canal question, backed

the UAR's refusal to allow use of the canal by Israel. In his opening address to Jordan's Parliament on October 1, King Hussein said, "The Palestine question is our prime question, and our entire efforts will be mobilized to regain our rights in Palestine." On November 15 the prime minister expressed concern over reported Israeli plans to take water from the Jordan River in the vicinity of the Sea of Galilee for irrigation projects in southern Israel. On December 25 the Jordanian government announced that it had proposed to Lebanon and the UAR as a countermeasure the diversion of the sources of the Jordan into the Arab-controlled Yarmuk River.

KANSAS. Central state, United States; admitted to the Union, Jan. 29, 1861. The "Sunflower State" ranks 14th in area and 29th in population among the 50 states.

Area and Population.—Area: 82,276 square miles (land, 82,108; inland water, 168), divided into 105 counties. Population: (1950) 1,905,299; (est., July 1, 1958) 2,114,000. Urban places with populations above 10,000 (as estimated by the State Board of Agriculture for March 1, 1958) are:

Arkansas City	14,581	Kansas City	131,245
Atchison	13,007	Lawrence	23,889
Chanute	10,499	Leavenworth	22,812
Coffeyville	18,291	Liberal	11,945
Dodge City	12,304	Manhattan	19,223
El Dorado	12,580	Newton	14,434
Emporia	15,283	Ottawa	10,784
Fort Scott	10,203	Parsons	13,362
Garden City	10,623	Pittsburg	19,418
Great Bend	17,184	Prairie Village	16,828
Hays	10,864	Salina	36,209
Hutchinson	36,863	Topeka (*capital*)	110,648
Independence	11,622	Wichita	250,099
Junction City	18,842	Winfield	10,923

Executive.—Chief state officers in 1959:
Governor: George Docking (Democrat)
Lieutenant Governor: Joseph W. Henkle, Sr.
Secretary of State: Paul R. Shanahan
Treasurer: George Hart
Attorney General: John Anderson, Jr.
Auditor: George Robb
Supt. of Public Instruction: Adel F. Throckmorton

Constitution and Judiciary.—The present constitution went into effect in 1861. The Supreme Court comprises seven justices; chief justice in 1959 was Jay S. Parker.

Legislature.—The Kansas Legislature comprises a 40-member Senate (in 1959, 32 Republicans, 8 Democrats), and a 125-member House of Representatives (69 Republicans, 56 Democrats), which meet annually commencing the second Tuesday in January. The 1959 legislature reapportioned seats in the House of Representatives, with the result that the two largest counties gain 2 seats each, 3 other counties gain 1 seat each, and 7 counties each lose 1 seat. (See also below, *Principal Events, 1959.*)

Finance.—In the 1958–59 fiscal year, state operating revenue of $351,859,300.04 comprised $216,588,287.60 from state tax sources, $97,133,198.99 from the federal government, and $38,137,813.45 from other sources. Tax revenue consisted of $72,022,008.69 from a 2½% general sales tax, $22,054,146.43 from individual income taxes, $7,098,733.60 from corporate income taxes, $48,448,027.78 from motor fuel taxes, $4,314,243.30 from licensing, and $62,651,127.80 from other sources. Expenditures

of $348,574,802.04 comprised $91,867,843.50 for education, $85,049,283.47 for health, welfare, and safety, $121,737,728.19 for highways, and $49,919,946.88 for all other purposes. There was no state long-term indebtedness.

Banking.—As of June 10, 1959, the state's 169 national banks had $1,275,942,000 in assets, $920,633,000 in demand deposits, and $225,856,000 in time deposits. The 426 state banks had assets of $1,104,391,185.16, demand deposits of $553,416,714.61, and time deposits of $240,934,980.10.

Education.—School attendance is compulsory between the ages of 7 and 15, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $127,738,833 ($297.08 per pupil in grades 1–8; $477.77 per pupil in grades 9–12), comprising $94,782,214 from local school districts, $28,868,976 from the state, and $4,087,643 from the federal government. Outlays for construction and improvements amounted to $36,163,571, financed partially from the sale of bonds. Teachers' salaries (1958–59) averaged $4,124 (high school, $4,485; junior high, $4,778; elementary, $3,844).

KANSAS SCHOOL STATISTICS, 1957–58

Type of school	No.	Teachers	Students
Public elementary (1–8)	2,360	14,281	312,067
Public secondary (9–12)	580	6,603	108,590
Private and parochial elementary and secondary	248	1,552	43,494
Junior colleges	21	487	6,095
Teachers colleges	3	522	8,171
Colleges and universities	18	2,315	29,909

Social Welfare.—In the 1958–59 fiscal year, public assistance expenditures from federal and state funds (excluding institutional costs) totaled $44,023,393, including $27,734,464 for the aged, $8,874,590 for dependent children, and $4,103,122 for the permanently and totally disabled. A monthly average of 66,835 persons received public assistance. State expenditures for mental health activities totaled $13,173,878; for correctional and penal programs, $3,823,393.

Labor Force.—Wage and salaried workers employed in nonagricultural establishments on June 15, 1959, numbered 552,100, slightly above the 541,600 total for the previous June 15, and also above the 540,200 average for 1958. The largest number was employed in wholesale and retail trade (124,200), followed by manufacturing (118,800) and government (105,200). Unemployment in 1958 was up to an average of 36,000, compared with 25,600 in 1957. The state paid $14,173,045 in unemployment compensation during the year ending June 30, 1959.

Manufacturing.—There were 3,540 manufacturing plants in the state in 1958. Value added by manufacture totaled $1,224,998,000 in 1957, and outlays for new plant and equipment amounted to $89,229,000. During the first 11 months of 1958, 94 new industrial plants were started, principally for chemicals, mobile homes, vending machines, helicopters, and restaurant equipment. Expenditures for plant expansions alone in 1958 totaled $67.8 million, with the largest single investment ($53 million) being made by the Boeing Airplane Company at Wichita.

Production workers, who in 1957 numbered 129,689 and earned $612,359,000 in wages, averaged $93.47 in August 1959 for an average workweek of 40.6 hours.

President Eisenhower turns over first spadeful of earth in ground-breaking ceremonies, October 13, at the Eisenhower Library, Abilene, Kans. The library will be part of a center which includes a museum and the president's boyhood home.

Agriculture.—Cash farm income for the first nine months of 1959 dropped to $848,228,000 from $894,393,000 reported for the corresponding period of 1958. For the full year 1958, income comprised $563,662,000 from livestock and livestock products, $619,936,000 from crops, and $34,965,000 in federal payments. Principal income sources in 1958 were wheat, $426,288,000; cattle, $380,504,000; and sorghum grain, $127,094,000.

There were 117,000 farms in the state in 1958. Total acreage (1954) of 40,024,000 included 21,-

* Average, 1949–57. (Source: U.S. Department of Agriculture.)

440,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 4,476,000 cattle, 1,067,000 hogs, 503,000 sheep, and 10,329,000 chickens (excluding commercial broilers). There were 137,000 family and hired workers engaged in farming during the week of Nov. 22–29, 1959.

Transportation and Communications.—State and federal funds disbursed for highways in the 1958–59 fiscal year totaled $85,995,736, and 2,183 miles of new construction were completed.

Highways and roads on June 30, 1959, totaled 124,481 miles (69,407 surfaced). Registered *motor vehicles* numbered 1,112,298 on Jan. 1, 1958, including 829,381 passenger cars. There were (1958) 13 *railroads* with 8,575.83 miles of main and branch lines and (1959) 8 regularly scheduled *airlines* and 199 *airports and airfields* (107 commercial and municipal, 8 military, and 84 private).

Communications media (1959) included 46 AM and 2 FM *radio stations* (3 radio stations are devoted to education); 11 VHF *television stations*, including 1 educational outlet; 51 daily *newspapers* (circulation, 700,000) and 291 other newspapers (390,000); and (January 1) 198,100 business and 631,900 residential *telephones*.

Principal Events, 1959.—Another good crop-growing year helped produce an estimated gross farm income of $1.175 billion in 1959, the fourth highest in the state's history. Production of wheat, the number one crop, approximated 210 million bushels, the seventh largest in Kansas history. The corn crop, estimated at almost 82 million bushels, was the largest since 1950; barley, the second largest in Kansas history; soybeans, second largest; and sorghums (137 million bushels), the largest.

For the first time in years, Kansas expected to finish a fiscal year (1959–60) with a surplus, an estimated $15 million. This prospective favorable balance was mostly achieved by the upward adjustment of the income tax and the ½% increase in the sales tax (to 2½%) accomplished by the 1958 legislature. Because of the expected favorable balance, no new general taxes were authorized by the 1959 legislature.

A stricter drivers' licensing law was passed, and another measure provided for more severe penalties for convictions for drunken driving. An effort was also made to bring the Kansas vehicle code into greater conformity with the national code.

Public schools fared well in the 1959 session, elementary school aid being $17.4 million and high school aid, $7.9 million. "Emergency" aid of $2.6 million, which allows $6 per pupil to all elementary and high schools, was also granted.

Workmen's compensation benefits were increased, shoplifting penalties were strengthened, a substantial reapportionment of the House of Representatives was authorized (see above *Legislature*), and a start was made on a state program for educational television. A controversial public employees' retirement act was vetoed by the governor.

Provision was made to submit two constitutional amendments to the voters in 1960. One would grant powers of city home-rule, allowing the assignment of cities into as many as four classes for purposes of limiting or prohibiting their taxing authority. The other would authorize the legislature to set up procedures insuring the continuity of state and local governmental operations in periods of emergency resulting from enemy attack.

On February 27 the executive board of the Agricultural Hall of Fame selected a building site near Kansas City, Kans., on which to erect the proposed national memorial to agriculture and related industries. Funds were being raised for construction expected to commence in 1960.

Dwight D. Eisenhower returned to Kansas on October 13 for ground-breaking ceremonies for the new Eisenhower Presidential Library to be erected south of the Eisenhower home and museum at Abilene.

Principal Events by: NYLE H. MILLER, *Secretary, Kansas Historical Society.*

KASHMIR (JAMMU AND KASHMIR). Although included in the Indian constitution, this Himalayan state (area, 92,780 square miles; pop., 4,410,000 in 1951), famous for the beauty of its central valley, has been the subject of dispute for 12 years between India and Pakistan. A cease-fire line under observation of the United Nations divides the territory, part of which (in Ladakh Province) also is claimed by Communist China (see below, *Principal Events, 1959*).

Jammu and Kashmir was incorporated with the rest of India at the reorganization of states in 1956, the Hindu ruler, Maharajah Hari Singh, having ceded the territory to that government in 1947. Srinagar (pop., 207,787 at the 1941 census) is the Indian capital. Azad (Free) Kashmir comprises northern and western areas (aggregating between a third and a half of the state), which contain approximately a quarter of Kashmir's predominantly Moslem population. Muzaffarabad, in Azad, is the seat of government.

India-Controlled Kashmir.—Jammu and Kashmir has 6 seats in the Indian House of the People, and there are 100 seats in the state legislature under the new constitution. Revised budget estimates for 1958–59 showed revenue receipts of Rs.111,800,000 (1 rupee = U.S. $0.21); revenue expenditure, Rs.94,200,000; and capital expenditure, Rs.56,400,000. Revenue account expenditure under the 1959–60 budget was put at Rs.81,600,000, which included civil works and road transport, Rs.23,200,000; education, Rs.19,100,000; irrigation, Rs.16,418,000; and power development, Rs.13,571,000. A surplus of Rs.36,100,000 was indicated, estimating receipts from internal sources at Rs.11,770,000. The state's annual share (for 5 years begun in 1957) of Indian taxation and central grants is Rs.42,500,000.

Educational facilities in 1957 aggregated 743 schools (including 590 primary schools). In 1958, plans were announced for the opening of 340 new basic schools and 2 new postmatriculation training schools. In addition to the University of Jammu and Kashmir (opened in 1948) there are 12 arts and science colleges, 3 professional, and 9 special educational institutions. A state medical college was to be inaugurated in 1959; 10 new health centers are planned for construction in Jammu in 1959–60.

Besides agriculture, the chief industry is the production of raw silk. Forestry is also important. Five-year plan projects in progress in 1958 included the establishment of new factories to produce cement, bricks and tiles, and veneer and ceramics. A survey was completed in 1959 for a major hydroelectric project in Jammu.

Kashmir is linked with the railway system of India by the newly constructed Jammu-Pathankot road. The widened western tube of the Banihal Tunnel was opened to all-weather traffic on Dec. 21, 1958, reducing the distance between Jammu and Kashmir by 18 miles. The eastern tube was to be ready for light traffic by the end of 1959. Under the 1959–60 budget, Rs.8 million was allocated to the construction of 146 miles of new roads; existing road mileage was 278.

Azad (Free) Kashmir.—The government is headed by a president (K. H. Kurshid, who took office on May 1, 1959). While the United Nations holds Pakistan responsible for supervising one side of the 1948 cease-fire line, the territory of Azad Kashmir has not been legally incorporated into that of Pakistan. The latter government, however, supports many development, health, and other projects initiated by the native administration and makes yearly grants toward the setting up of new schools. Higher education is provided by degree-granting institutions at Mirpur and Muzaffarabad, and by two other colleges. In addition, seats are reserved for Azad Kashmir students in Pakistan institutions teaching engineering, agriculture, administration, and other subjects; Rs.69,580 were spent on technical scholarships in 1958–59, and 53 stipendiaries completed their medical studies.

Agriculture and forestry are paramount in the economy. Cooperative societies organized to furnish agricultural credit through branches of the National Bank of Pakistan numbered 500, with 8,000 members, in 1959.

There are 950 miles of motorable roads; a project to increase road mileage by 30% was begun in 1959.

Principal Events, 1959.—Kashmir came prominently into the news on August 28 when Prime Minister Nehru accused the Chinese Communists

of aggression against India's Northeast Frontier Agency, and at the same time revealed that Chinese troops had established a camp in the Spanggur area of Kashmir's Ladakh district in 1957, apparently without India's knowledge. He announced that the entire northeast frontier had been placed under military control, directed by Lt. Gen. K. S. Thimayya, chief of staff of the Indian Army; previously the Kashmir border had been guarded only by a police force. Detailing Chinese border incursions, Nehru said that China had completed nearly a year earlier a motor road linking Gartok in western Tibet with Yarkand in Chinese Turkestan and cutting through a section of Ladakh. Indian countermeasures included the recruiting of a second battalion of Ladakhis in the state militia, and a speed-up in construction of the state's first motor road to Leh, capital of Ladakh, designed to strengthen strategic communications in the area.

The first major clash between Chinese and Indian forces in Ladakh came on October 21, when nine members of an Indian police patrol were killed and seven captured. Three Indians were taken prisoner the day before. According to New Delhi, the fighting took place 40 miles within Indian territory. In November, Chinese troops were reported to be entrenching themselves for the winter in sections of Ladakh.

As India and Pakistan moved toward accord on lesser issues, and in view of the Chinese border pressures, some hope was expressed late in 1959 that an agreement might be reached on the thorny Kashmir dispute. There were indications that Pakistan might relax its position on the dispute, and President Mohammed Ayub Khan, on October 23, said that a settlement was essential. United Nations Secretary General Dag Hammarskjöld had visited the Kashmir cease-fire line on March 21.

In a trial begun on March 14, Sheik Mohammed Abdullah, former prime minister of Indian Kashmir, was found guilty of conspiracy to overthrow the Kashmir government. Seven subsequent appeals taken by the defendant, who favors a plebiscite to determine the political alignment of the state, proved unsuccessful.

DONOVAN ROWSE,
Author and Publicist.

KENNEDY, John Fitzgerald, U.S. senator: b. Brookline, Mass., May 29, 1917. Elected United States senator in 1952 (re-elected, 1958), he emerged in 1959 as a leading contender for the 1960 Democratic presidential nomination.

He is the son of Joseph P. Kennedy, American financier and former United States ambassador to Great Britain (1937–40). After attending the London School of Economics (1935–36), he entered Harvard University, from which he was graduated in 1940. During World War II he served with the U.S. Navy.

Kennedy entered national politics in 1946, when he was elected as a Massachusetts representative to Congress; he was re-elected in 1948 and 1950. In 1952 he defeated the Republican incumbent, Henry Cabot Lodge, for a seat in the Senate, where he was quickly identified with the moderate liberal faction. In the upper house, Kennedy—youthful, handsome, personable—became one of his party's most popular congressional leaders, and in 1956 he was Sen. Estes Kefauver's leading but unsuccessful competitor for the Democratic vice-presidential nomination. In May 1957, Kennedy won the Pulitzer Prize in biography for his volume, *Profiles in Courage,* a study of acts of courage and integrity in the lives of several American political figures.

In 1959, Senator Kennedy was involved in a major congressional controversy over passage of a labor bill. In January he introduced a bill aimed in part at eliminating abuses and racketeering among unions, but certain officials, including the president, criticized the bill as too mild. Meanwhile, a stricter measure, the Landrum-Griffin bill, was introduced into the House. In September, a Senate-House conference committee, with Senator Kennedy as chairman, worked out a compromise measure that was approved by Congress and signed by the president (see also LABOR).

Kennedy was one of the first Democrats mentioned as a possible presidential candidate in 1960, and it was increasingly apparent in 1959 that he was strongly interested in the nomination, particularly in view of his frequent nationwide tours, which began in April with a trip to Wisconsin, a key state in the 1960 presidential primaries. Finally, on Jan. 2, 1960, at a news conference in Washington, Kennedy announced that he would enter his name in state primaries.

Senator Kennedy faced a potential obstacle in securing the nomination. Some political observers believed that his being a Roman Catholic would seriously weaken his candidacy, while others claimed that the importance of the religious issue in politics had diminished to the point where it would no longer be a major factor in determining the electorate's choice for president. In *Look* magazine (Feb. 3, 1959), Kennedy stated his personal views on the issue of Catholicism in public life, writing in part that "nothing takes precedence over [an officeholder's] oath to uphold the Constitution . . . including . . . strict separation of church and state."

KENTUCKY. South Central state, United States; admitted to the Union, June 1, 1792. The "Bluegrass State" ranks 37th in area and 21st in population among the 50 states.

Area and Population.—Area: 40,395 square miles (land, 39,864; inland water, 531), divided into 120 counties. Population: (1950) 2,944,806; (est., July 1, 1958) 3,087,000. Urban places with populations above 10,000 (as estimated by the State Department of Health for July 1, 1957) are:

Ashland	35,000	Louisville	408,300
Bowling Green	23,000	Madisonville	12,600
Covington	75,000	Middlesborough	13,300
Fort Thomas	17,200	Newport	35,500
Frankfort (*capital*)	20,800	Owensboro	43,200
Henderson	18,100	Paducah	35,800
Hopkinsville	16,900	Richmond	12,800
Lexington	66,900		

Executive.—Chief state officers in 1959:
Governor: Albert B. Chandler (Democrat)
Lieutenant Governor: Harry Lee Waterfield
Secretary of State: Mrs. Thelma L. Stovall
Treasurer: Henry H. Carter
Attorney General: Jo M. Ferguson
Auditor: Mary Louise Foust
Supt. of Public Instruction: Robert R. Martin

Constitution and Judiciary.—The present constitution went into effect in 1891. The highest court, the Court of Appeals, comprises seven justices; chief justice in 1959 was Morris C. Montgomery.

Legislature.—The Kentucky General Assembly comprises a 38-member Senate (in 1959, 29 Democrats, 8 Republicans, 1 vacancy) and a 100-member House of Representatives (72 Democrats, 25 Republicans, 3 vacancies), which meet in even-numbered years commencing the first Tuesday after the first Monday in January.

Finance.—In the 1958–59 fiscal year, state revenue of $340,560,249 comprised $208,485,828 from state tax sources, $112,362,526 from the federal government, and $19,711,895 from other sources. Tax revenue consisted of $29,973,359 from sales and gross receipts taxes, $45,908,755 from individual income taxes, $16,689,701 from corporate income taxes, $67,219,377 from motor fuel taxes, $27,182,145 from licensing, and $21,512,491 from other sources. Expenditures of $390,183,362.90 comprised $92,478,966.06 for education, $92,711,416.45 for health, welfare, and safety, $158,997,191.21 for highways, and $45,995,789.18 for other purposes. Long-term indebtedness on Sept. 30, 1959, amounted to $70 million.

Banking.—As of June 10, 1959, the state's 88 national banks had $909,777,000 in assets, $623,099,000 in demand deposits, and $191,704,000 in time deposits. The 272 state banks had assets of $1,402,074,237, demand deposits of $750,293,818, and time deposits of $444,341,580.

Education.—School attendance is compulsory between the ages of 7 and 16. The National Edu-

cation Association estimated operating expenditures for Kentucky's public elementary and secondary schools in the 1959–60 school year at $123,500,000 ($217 per pupil). Revenue comprised an estimated $73,500,000 from local school districts, $63,065,000 from the state, $7,260,000 from the federal government, and $12 million from other sources. Capital outlays and interest payments totaled $42 million. Teachers' salaries averaged $3,201 (high school, $3,349; elementary, $3,127).

KENTUCKY SCHOOL STATISTICS, 1958–59

Type of school	No.	Teachers	Students
Public elementary (1–8)	3,084	15,167	446,257
Public junior high (7–9)	41	883	20,533
Public senior high (9–12)	417	6,552	147,817
Private and parochial elementary and secondary	347	2,725	84,671
Colleges and universities	41	...	42,703

Social Welfare.—In the 1958–59 fiscal year, public assistance expenditures from federal and state funds (excluding institutional costs) totaled $52,693,688, including $29,068,351 for the aged, $17,970,462 for dependent children, and $3,994,380 for the permanently and totally disabled. A monthly average of 143,029 persons received public assistance. State expenditures for mental health activities amounted to $928,472.60; for correctional and penal programs, $2,901,532.10.

Labor Force.—In July 1959, nonagricultural employment was 626,300, compared with 615,800 a year earlier and the 1958 average of 623,500. Of nonfarm employees in 1959, 26.9% were engaged in manufacturing, 21.3% in trade, and 17.2% in government. Unemployment in August 1959 was down by almost 50%, to 21,530, from the figure of 42,240 recorded for the previous August. The state paid $46,437,392 in unemployment compensation during 1958.

Manufacturing.—In 1958 there were 160,827 insured employees in manufacturing plants who

MAJOR KENTUCKY MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.* (thousands of dollars)
Food and kindred products	28,328	$116,593	$408,165
Nonelectrical machinery	25,112	120,847	317,802
Tobacco manufactures	10,403	39,646	233,163
Chemicals and products	10,331	57,511	202,295
Transportation equipment	6,373	34,272	124,948
Fabricated metal products	12,340	57,319	86,894
Primary metal industries	5,354	41,287	67,188
Printing and publishing	7,399	38,936	63,465
Apparel and related products	17,861	41,244	57,198
Stone, clay, glass products	5,325	21,083	42,696

* For definition see footnote 1 in the article *Industrial Production.* (Source: *Annual Survey of Manufactures: 1957.*)

received $734,282,684 in wages. Value added by manufacture (1957) totaled $1,838,617,000, and outlays for new plant and equipment amounted to $153,804,000. Production workers averaged $83.03 for an average workweek of 40.9 hours in August 1959.

KENTUCKY MINERAL PRODUCTION, 1958

(In short tons, except as noted)

Mineral	Quantity	Value
Clays	737,000	$ 2,957,000
Coal	66,312,000	289,385,000
Fluorspar	25,861	1,201,000
Natural gas (1,000 cu. ft.)[1]	72,248,000	17,412,000
Natural gas liquids (bbl.)	4,490,023	10,656,000
Petroleum (bbl.)[1]	17,509,000	51,652,000
Sand and gravel	4,685,000	4,835,000
Stone	12,597,000	17,360,000
Other minerals	...	7,437,000
Total	...	$402,121,000[2]

[1] Preliminary. [2] Total adjusted to eliminate duplication in the value of clays and stone. (Source: U.S. Bureau of Mines.)

Mining.—In 1958 Kentucky ranked 10th among the states in the value of its mineral output, with 2.43% of the national total. It was second in output of ball clay (24% of United States production) and third in bituminous coal mining. Employment in the state's mineral industries declined 12% between 1957 and 1958, partly owing to a severe recession in coal mining. Employment in all mineral operations with four or more employees averaged 37,355 in December 1958.

Agriculture.—Cash farm income for the first nine months of 1959 was up to $299,732,000 from $292,309,000 for the comparable period of 1958. For the full year 1958, income comprised $298,217,000 from livestock and livestock products, $249,627,000 from crops, and $22,661,000 from government payments. Principal income sources in 1958 were tobacco, $192,274,000; cattle, $108,701,000; and dairy products, $81,303,000.

KENTUCKY CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	308	395	260
Corn (1,000 bu.)	76,202	75,803	85,775
Hay (1,000 tons)	2,215	2,756	2,369
Popcorn (1,000 lb.)	20,817	57,710	30,060
Potatoes (1,000 cwt.)	1,056*	890	890
Soybeans (1,000 bu.)	2,286	3,798	3,768
Strawberries (1,000 lb.)	9,278*	10,560	4,080
Tobacco (1,000 lb.)	422,189	326,348	357,362
Wheat (1,000 bu.)	4,761	3,948	4,484

* Average, 1949–57. (Source: U.S. Department of Agriculture.)

There were 192,000 farms in the state in 1958. Total acreage (1954) of 18,034,000 included 4,541,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 1,834,000 cattle, 1,225,000 hogs, and 7,346,000 chickens (excluding commercial broilers). There were 236,000 family and hired workers engaged in farming during the week of Nov. 22–29, 1959.

Transportation and Communications.—State and federal funds spent for design and utility contracts, rights-of-way, and construction in the 1958–59 fiscal year totaled $72,695,000, and 299 miles of new construction were completed.

Highways and roads on June 1, 1959, totaled 67,323 miles (22,555 surfaced), including 3,087 miles of city streets. Registered *motor vehicles* numbered 1,049,800 on June 30, 1959, including 835,372 passenger cars. There were (1958) 22 *railroads* operating 5,941.35 miles; 7 regularly scheduled *airlines;* and 39 *airports and airfields* (20 commercial and municipal, 2 military, 13 private, and 4 other).

Communications media (1959) included 76 AM and 15 FM *radio stations;* 3 VHF and 3 UHF *television stations;* 25 daily *newspapers* (circulation, 1,113,179) and 144 other newspapers (339,352); and (January 1) 187,500 business and 555,900 residential *telephones.*

Principal Events, 1959—Kentucky experienced a highly exciting year in 1959. In politics the two factions of the Democratic Party were involved in a bitter struggle centering on the gubernatorial nomination in the May primary. Lt. Gov. Harry Lee Waterfield was favored by Gov. Albert B. ("Happy") Chandler, who could not succeed himself. Opposed to him was Bert Combs of Prestonsburg, a former judge of the Court of Appeals. Chandler had defeated Combs for the party's nomination in 1955, and there was considerable personal bitterness between the two in the 1959 race.

Judge Combs associated himself with Wilson Wyatt, former Louisville mayor and former federal housing administrator, who campaigned for the lieutenant governorship. They were supported by three former governors of the state and by a strong following of other former state officials. Waterfield was defeated after a bitter campaign, and the press considered this a serious defeat for the Chandler administration.

In the general campaign, Combs and Wyatt

were opposed by Republicans John Robsion, Jr., a former congressman from Louisville, and Pleaz Mobley, of Manchester, candidate for lieutenant governor. There were few pronounced issues between the Republicans and Democrats, although Robsion promised that he would not recommend any new taxes, while Judge Combs left this question open to future decision.

Within the Democratic Party feuding continued. Chandler attacked Combs, on one occasion warning that "the salvation of the state might well depend on his getting beat." The intraparty bitterness virtually ended any possibility that Chandler, who had announced himself a candidate for the 1960 Democratic presidential nomination, would be supported as a favorite-son candidate by the Kentucky delegation to the convention.

In the general election of November 3, Judge Combs and almost all of the Democratic candidates were elected. The Combs plurality of more than 179,000 votes was the largest ever given a Kentucky candidate. Democrats returned 30 out of 38 candidates for the Senate and 80 out of 100 House members. The new administration took office on December 8.

On the ballot were two proposals to amend the Kentucky Constitution. One of these, approved by the voters, proposed to pay bonuses to veterans of the Spanish-American War, the two World Wars, and the Korean War. Payments ranging from $300 to $500 will be made to veterans or their next of kin. Funds to pay this bonus will come from a bond issue of between $300 million and $500 million. A second submitted amendment, proposing that county sheriffs be made eligible to succeed themselves, was defeated.

Economically most of Kentucky showed a remarkable revival from the 1958 recession. This was not true, however, for eastern Kentucky, which continued to be hurt by the extended United Mine Workers' strike, starting March 9, in the eastern coalfields. Kentucky coal production suffered an 11% production loss, and the approximately 7,000 striking miners suffered seriously. Outbreaks of violence, including bombings and even murder, in the communities of Barbourville, Hazard, and Whitesburg, led Governor Chandler on April 24 to send National Guardsmen into the coal-mining area.

On the other hand, western Kentucky showed promise of major progress. The Tennessee Valley Authority (q.v.) announced in October its decision to locate a new $100 million steam plant at Paradise, Ky. It entered into a 17-year contract with the Peabody Coal Company for delivery of 65 million tons of coal.

Oil discoveries in various parts of the state, especially in Green County, created considerable excitement in 1959. Old oilfields were again being explored and the area of production enlarged. During the first eight months of 1959, Kentucky produced 18,771,545 barrels—more than in all of 1958.

Despite an early spring drought, 1959 was a good growing year for crops. Tobacco production, for example, was estimated at 357,362,000 pounds, compared with 326,348,000 in 1958.

The state Department of Conservation estimated the year's income from the tourist business at $500 million, a sum almost equal to the entire agricultural income of the state.

Principal Events by: THOMAS D. CLARK, *Professor of History, University of Kentucky; Author of "Frontier America" (1959).*

KENYA COLONY AND PROTECTORATE. See BRITISH EAST AFRICA.

KHRUSHCHEV, Nikita Sergeyevich, Soviet premier: b. Kalinovka, Ukraine, Russia, April 17, 1894. More in word than deed, Premier Khrushchev campaigned untiringly in 1959 in an effort to impress the peoples of the world with the Soviet Union's desire for peace. Throughout the year he reiterated this theme: his desire for an accommodation between the East and West, for an end to the armaments race, and for friendly economic competition between the two systems.

The highlight in Khrushchev's professed efforts to reach an understanding with the West came on his historic 13-day visit to the United States in September 1959. On his coast-to-coast tour, the Soviet leader demonstrated his alternate moods of truculence and affability; and his protestations of sincerity were interspersed with ominous allusions to Soviet military might. While in the United States, Khrushchev presented his plan for total disarmament to the U.N. General Assembly on September 18 (see DISARMAMENT) and met privately with President Eisenhower at Camp David on September 25–27. Although the year brought no consequential change in the Kremlin's basic position, many in the West were heartened by Khrushchev's seemingly conciliatory attitude.

Born in poverty, the son of a coal miner, Khrushchev joined the Communists in 1918 and started his political career as a minor party worker in the Ukraine. By 1935 he had advanced to leadership of the Moscow Oblast party organization, and from 1938 to 1949 (except for a brief period in 1947) he directed the party in the Ukraine. A lieutenant general in World War II, he returned as head of the Moscow organization in 1949, and on Sept. 13, 1953, was named first secretary of the Central Committee of the Communist Party, the most powerful political position in the USSR. He became a member of the Presidium (formerly the Political Bureau) of the Supreme Soviet in 1939. On March 27, 1958, he was elected premier (chairman of the Council of Ministers) by the Supreme Soviet.

Premier Khrushchev remained adamant in 1959 on the Berlin issue, but his talks with President Eisenhower in September reportedly resulted in the removal of any Soviet ultimatum against continued Allied occupation of the city. Khrushchev had warned earlier (February 18) that a Western attempt to force its way into Berlin would mean "the beginning of war," and he declared (February 24) that the Soviet Union would sign a separate peace treaty with East Germany if necessary. No progress was made on the Berlin dispute during British Prime Minister Macmillan's discussions (ending March 3) with Khrushchev in Moscow, but a week later, on a visit to East Berlin, the Soviet leader said that West Berlin, if made a free city, might be guarded by Big Four or neutral troops.

The establishment of Allied missile bases on European soil brought heated denunciations from Khrushchev during the year. Returning from a 12-day trip to Albania and Hungary in the spring, he threatened to set up nuclear missile bases in Albania and other satellite nations unless the West agreed to a ban on such installations in the Balkans. The existence of United States military bases on the Soviet periphery was one of the arguments to which Khrushchev frequently returned during the visit of Vice President Nixon (q.v.) to the Soviet Union in July (notably at the highly publicized debate between the two at the opening of the American National Exhibition in Moscow, July 24).

Khrushchev arrived in Washington on September 15 for his heralded tour of the United States. He was greeted in a generally cool manner in the nation's capital, New York City (September 17–19), and Los Angeles (September 19–20), but friendly and at times warm receptions awaited him on the latter part of his trip, at San Francisco

(September 20–22), Des Moines and Coon Rapids, Iowa (September 22–23), and Pittsburgh (September 23–24). In New York City and Los Angeles, hostile speakers piqued him to the point of threatening to cancel the remainder of his tour, and his flashes of anger in Los Angeles prompted the government to insist that the visitor be spared any further taunts. The rest of the journey brought no untoward incidents, and the premier's attitude mellowed noticeably following amicable exchanges with crowds along the route to San Francisco.

The climactic talks with President Eisenhower (q.v.) on September 25–27 produced no momentous decisions, but they did serve to ease the immediate pressure over Berlin and to insure a broadening of cultural and scientific exchanges. The principle of a summit conference (q.v.) also was established, and on December 30 Khrushchev accepted Western proposals for a Big Four parley in Paris, to begin May 16, 1960.

Soon after his United States trip, Khrushchev traveled to Peking on September 30 to attend the 10th anniversary celebrations of the Chinese Communist regime and to confer with Mao Tse-tung. Observers saw signs of coolness between Khrushchev and the Soviet Union's major ally, particularly in the lack of Chinese response to his enthusiasm over coexistence with the United States.

But if the world sometimes saw an expansive, joking Khrushchev in 1959, it also heard some fearfully blunt reminders of the Soviets' growing rocket and nuclear power. Typical of these sudden insights into the ruthless personality underlying the ingratiating pose which he uses to advantage were Khrushchev's boasts (in May) that if war should come the Western nations "would be literally wiped off the face of the earth," and that eight hydrogen bombs would suffice to obliterate West Germany, and (in November) that at least one Soviet factory was producing 250 hydrogen-warhead rockets each year—to which he appended this characteristic note: "We are ready to sink all this in the sea in the interests of insuring peace on earth."

KISHI, Nobusuke, prime minister of Japan: b. Yamaguchi Prefecture, Japan, Nov. 13, 1896. Premier from Feb. 25, 1957, after the resignation of Tanzan Ishibashi, Kishi was elected president of the Liberal-Democratic Party in March 1957 and re-elected premier on June 12, 1958.

After his graduation from Tokyo Imperial University in 1920, he held various government posts. In the early 1940's he was vice minister (1939–41) and minister (1941–43) of commerce and industry, and he remained in Hideki Tojo's cabinet as vice minister of munitions until 1944, when disagreement with the premier forced him to resign. After World War II he was held by the United States occupation forces until 1948. Elected to the Diet in 1953, he helped to bring about the coalescence in 1955 of the Democratic Party, which he had founded, and the Liberal Party. Before his election by the Diet as premier in early 1957, he had served as foreign minister in Ishibashi's cabinet.

The premier reshuffled his cabinet on Jan. 12, 1959, and again on June 18 in order to increase cabinet representation of his faction of the Liberal-Democratic Party, disunited apparently through personal rivalries rather than over major policy differences. On January 24 he was reconfirmed as party leader for the following two years. Local elections in April and Diet elections in June increased the Liberal-Democrat majority over the

opposing Socialists and independents. Kishi's position thus strengthened, he visited several major European and Latin American countries in July and August. On his return he publicly confirmed the foreign policy he had followed earlier: to cooperate more closely with the non-Communist world in spite of the desire for neutrality expressed by his political opposition. Such rapprochement was to be accomplished partly by rewriting, rather than simply amending, the defense alliance of April 28, 1952 with the United States, so that Japan would be given more responsibility in the mutual defense pact. In spite of a demonstration on November 27 by more than 20,000 union workers and university students against the revision of the alliance, the premier went ahead with his plans to visit the United States for the signing of the pact on Jan. 19, 1960. (See also JAPAN.)

KISTIAKOWSKY, George Bogdan, Russian-American physical chemist: b. Kiev, Russia, Nov. 18, 1900. On May 28, 1959, President Eisenhower named him special assistant for science and technology, succeeding Dr. James R. Killian, Jr. The post carries the responsibility for overall advice to the administration on scientific problems, including the defense and space programs.

Dr. Kistiakowsky has in the past two decades served the federal government on a number of missions, interspersed with his duties as a teacher and researcher at Harvard University. During World War II he worked as a civilian at the Los Alamos (N. Mex.) nuclear laboratory on explosives needed to detonate the first atomic bomb. He served as a special adviser on the ballistic missile program on the President's Science Advisory Committee from its establishment in 1957 under Dr. Killian. And he was one of the three-man United States delegation to the East-West talks in Geneva in November 1958 on the prevention of a surprise nuclear attack.

Dr. Kistiakowsky received his early schooling in Kiev. In 1918, following the outbreak of the Russian Revolution, he fought with the anti-Communist White Russian Army as a tank soldier. After a period of internment in Turkey and the Balkans, he made his way to Germany in 1921 and studied at the University of Berlin (Ph.D. 1925) under the chemist Max Bodenstein. In 1926 he moved to the United States, where he became a citizen in 1933. He was at Princeton University for the last four years of the 1920's as a research fellow and associate, and in 1930 transferred to Harvard University, where he rose to the rank of full professor by 1937.

KOREA. A peninsula projecting from northeastern Asia toward Japan, which lies some 120 miles across the Korea Strait, Korea has an area (including adjacent islands) of 85,248 square miles (South Korea, 37,424; North Korea, 47,824). It borders on Siberia for 11 miles and on Manchuria for approximately 800 miles. Its western shore is washed by the Yellow Sea, and its eastern by the Sea of Japan. The mountainous northern half of the country, endowed with richer mineral, timber, and waterpower resources, has most of the heavy industries, mines, and hydroelectric plants. The less rugged south is chiefly agricultural, with light industries.

The population of South Korea was officially estimated at 22,836,000 in mid-1959; that of Seoul, the capital, at 1,756,406 in 1958. Other large cities, with their 1955 census populations, are Pusan (1,049,363), Taegu (488,960), and Inchon (321,072). The population of North Korea could be estimated at about 10,000,000; that of its capital, Pyongyang, at 700,000.

South Korea

Government.—To bring about the promised Korean independence and to receive the surrender of Japanese troops after V-J Day, Soviet forces occupied Korea north of the 38th parallel and United States forces the south in 1945. The perpetuation of this temporary arrangement in the racially homogeneous and economically indivisible nation resulted in a devastating war which began on June 25, 1950, and ended in a stalemate on July 27, 1953.

The 1945 Moscow agreement imposing on Korea a trusteeship for "a period of up to five years" failed to be implemented because of a United States–Soviet deadlock over Korean representation. Korea's case was laid before the United Nations by the United States. The U.N. General Assembly created the U.N. Temporary Commission on Korea in 1947 to facilitate the establishment of a national government through general elections, but the Soviet Union boycotted the commission and denied it access to North Korea. The commission therefore observed an election—held on May 10, 1948, in South Korea alone —of a 200-member Constituent Assembly for a 2-year term. This legislature, on July 12, adopted a constitution providing for a unicameral National Assembly and for a president with broad powers, and on July 20 elected Dr. Syngman Rhee to that office for a 4-year term. The formal proclamation of the Republic of Korea on Aug. 15, 1948, terminated United States military government in South Korea. On Dec. 12, 1948, the U.N. General Assembly declared the government of the Republic of Korea a lawful regime in "that part of Korea."

In the 1950 elections, National Assembly membership was increased to 210 for a 4-year term. In 1952, President Rhee, seeing no chance for re-election by a hostile assembly, forcibly changed the constitution to provide for a bicameral legislature and election of the president and vice-president by direct popular vote. Dr. Rhee was re-elected for a 4-year term on Aug. 5, 1952. In the third assembly election, held on May 20, 1954, for 203 members, Rhee's Liberal Party obtained 114 seats, while some opposition candidates withdrew from the race for reasons of personal safety. Subsequent shifting of alignment increased Liberal Party membership to 131.

President Rhee secured legislation in 1955 empowering him to "suspend or repeal adminstrative orders or dispositions of the Cabinet Ministers in case such orders or dispositions are deemed improper or illegal." This supplemented a constitutional amendment of Nov. 29, 1954 (forced through the assembly despite the lack of a two thirds majority vote), which eliminated the premiership and permitted Dr. Rhee (but no subsequent president) to run for re-election for life. On May 15, 1956, he was elected for a third term.

In the fourth National Assembly election (its membership was increased to 233), held on May 2, 1958, the number of Rhee's Liberal Party seats decreased from 131 to 126, while the Democratic Party increased its membership to 79 from 46. One seat went to the Unification Party, and 27 members were elected as independents. Subsequently elections to several seats were nullified because of irregularities; re-elections were held, and some legislators changed parties. As of November 1959, assembly membership was as follows: Liberal Party, 141; Democratic Party, 80; Unification Party, 1; and independents, 11.

Education.—In the 1958–59 school year there were 4,583,527 students in all types of schools. Of that number, 3,785,050 were pupils in 4,537 elementary schools; 618,025, students in 1,012 middle schools and 343 high schools; 100,887, students in 280 vocational schools; and 79,565, students in 61 colleges and universities.

Although 6 years of free elementary school education are provided for all children by the constitution, parents are required to pay a Parent-Teachers Association fee, levies for "building and physical facilities" and textbooks, and an education tax. Other supplementary contributions are reportedly solicited by school authorities.

Religion.—There are no accurate statistics on adherents of all faiths, but Confucianism and Buddhism predominate over Chontoism (Chondo-kyo), Christianity, and Tankun-kyo (the religion of Tankun, mythical founder of Korea). The 1959 South Korean yearbook listed 3,855,983 adherents of Buddhism and 454,770 followers of Chondo-kyo, while Christians, including children and Sunday School members, comprised 1,025,114 Protestants and 244,783 Roman Catholics.

Economic Conditions.—South Korea's economy has been sustained by foreign assistance which, from 1945 through June 1959, totaled about $2.8 billion. The damage caused by the Korean War has not been completely offset. Some 1,000,000 units of housing are urgently needed, and an estimated 2,700,000 persons are unemployed. Despite large crops farmers are hungry because of

low grain prices and the high prices of other commodities, and because they have had to pay black market prices for fertilizer and usurious interest rates on loans.

The 1958 rice crop yielded 3,540,000 metric tons, and the 1959 summer grain crop was estimated at 949,000 tons. Cereal and grain imports during 1958 amounted to 365,701 metric tons, valued at $51.1 million. Despite typhoons and floods in September 1959 (the severest in this century), in which 747 lives were lost, 3,186 persons were missing, and property damage was estimated as high as 104.9 billion hwan, a bumper rice crop was predicted for 1959.

The fish and seafood catch in 1958 totaled 395,000 metric tons. More than 221 million square yards of textiles were produced, and electric power generation amounted to 1,512 million kw.-hr. Production of other commodities, in metric tons, was as follows: cement, 296,000; coal, 2,671,000; iron ore, 261,025; tungsten concentrates, 3,012; and salt, 436,408. The gold output was 2,242 kilograms.

In 1958 imports amounted to $390 million, of which $337.5 million was financed by foreign aid, and exports to $16.8 million. In the first week of August 1959, the money supply totaled 220 billion hwan, compared with 164.3 billion hwan a year earlier. Official foreign exchange holdings on August 31 amounted to $150.1 million. Although the official exchange rate remained 500 hwan to U.S.$1, the free market rate was about 1,400 to $1 in September.

The national budget for 1959 anticipated revenues of 389.8 billion hwan to meet expenditures of the same amount, of which 142.2 billion was allotted for military expenses. The U.N. Commission for the Unification and Rehabilitation of Korea (UNCURK) commented in its 1958 report: "Defense expenditure . . . accounts for about half the general budget and is one of the factors limiting desirable social projects and economic recovery and growth." The commission's 1959 report said that "unification [of the country] could immeasurably improve the prospect of economic viability for the peninsula."

In fiscal year 1958–59 the United States provided $214.8 million in defense support, $5.8 million for technical cooperation, and $17.7 million from the Development Loan Fund (DLF). Direct military aid reportedly totaled about $200 million. The U.N. Korean Reconstruction Agency (UNKRA), created in 1950, concluded its program in 1959 after expending $149,274,389.

Political Developments.—The Rhee government's ramming through the National Assembly of 22 bills on Dec. 24, 1958, after locking out opposition legislators, brought far-reaching consequences. This action once again nullified American efforts to make South Korea a democratic model in Asia through the development of representative government. Of the new laws, Koreans considered the following the most detrimental to freedom:

(1) A sweeping new National Security Law which provides stiff prison terms for those who "disturb" the people by disseminating "false" information, who make derogatory remarks about high government leaders, and who collect information on political, economic, cultural, and military affairs. These catchall provisions were strenuously opposed by the press and the Korean Bar Association, as well as by the opposition Democratic Party.

(2) An amendment to the Local Autonomy Law whereby mayors and village heads are appointed instead of being elected.

(3) An amendment to the House of Councilors Election Law empowering the president to set a date for elections to the upper house, and requiring its political composition to be in direct ratio to present lower house membership.[1]

Because the opposition refused to recognize the legality of the 22 arbitrary acts, the National Assembly did not function normally in 1959.

On March 23, Choi In Kyu, appointed minister of home affairs three days earlier, demanded that: "All my subordinates should publicize the accomplishments of President Syngman Rhee through their families to assure his re-election in the next presidential election. Any employee who does not wish to do so or does not respect his superior, should quit his post in the government." Announcing his candidacy for a fourth term on April 15, President Rhee predicted: "All things being equal, the people will elect me next year from among other candidates."

Kyunghyang Shinmun, a respected opposition Roman Catholic daily and the second largest newspaper in South Korea, was ordered shut down on April 30 on charges of its "falsehoods and fabrications"; its consistently "unpatriotic, antisocial conduct"; its defamation of the speaker of the National Assembly; its advocacy of "insurrection"; its "undermining [of] confidence in the Armed Forces [for exposure of corruption in the army]"; its unauthorized account of a Communist spy arrest; and its "misrepresentation" of statements by President Rhee.

All political parties were ordered to notify the government of any gathering 10 days in advance and to submit a report on the results of such a meeting within 5 days after it had been held. Otherwise, the party would be outlawed. Meanwhile, elected mayors and district and village heads were being removed to make room for obedient Liberal Party appointees.

Cho Bong Am, who was minister of agriculture and forestry in Rhee's first cabinet, temporary speaker of the 2d National Assembly, and twice presidential contender (he polled 2,163,808 votes in 1956), was hanged on July 31, on charges of espionage, although he had renounced communism in 1945. (His Progressive Party had been outlawed almost three months before the 1958 National Assembly election.) National Police Director Lee Kang Hak warned newspaper editors against publicizing Cho's case, and his body was turned over to his family on condition that he be buried quietly without any public ceremony.

Dissension over presidential candidacy for the 1960 election between factions in the opposition Democratic Party was settled at its national convention on November 26 by the nomination of Chough Pyong Ok for president and Chang Myun (John M. Chang) for vice president.

North Korea

The Democratic People's Republic of Korea was established north of the 38th parallel on Sept. 9, 1948, after elections held independently of the U.N. Temporary Commission on Korea, and proclaimed itself the government of all Korea. It was headed by Kim Il Sung as premier and Kim Doo Bong as chairman of the Presidium of the Supreme People's Assembly. Assembly membership was reduced from 572 to 215 at the Aug. 27, 1957, elections, the first held since 1948. Kim Il Sung succeeded himself as premier on Sept. 20, 1957, but chairmanship of the Presidium passed to Choi Yong Kun. The replacement of Foreign Minister

[1] According to the 1958 election law, the upper house should have come into existence in January 1959, but President Rhee has not decreed its election date.

Nam Il, who had served as chief Communist negotiator for the Korean Armistice Agreement, by Vice Foreign Minister Pak Sung Chul was announced on Oct. 25, 1959, but Nam still retained his vice premiership.

Industrialization and expansion of agriculture seem to be the chief aims of the Korean Workers' (Communist) Party and the North Korean regime. The North Koreans have boasted that their Five-Year Plan, which began in 1957, would be fulfilled two years ahead of time. In December 1959, however, they decided to scrap the plan, whose overemphasis on heavy industry had caused serious difficulties, in favor of increased capital for housing and greater assistance to agriculture.

Claims of the North Koreans for 1958 output included 3.7 million tons of grain, 6,882,000 tons of coal, 393,000 tons of pig iron, 575,000 tons of steel, 1,244,000 tons of cement, 457,000 tons of chemical fertilizers, 682,000 tons of fish and seafood, 439,000 tons of salt, 110 million meters of textile fabrics, 7,630 million kw.-hr. of electricity, and housing for 21,600 families in Pyongyang alone. They also claim that government retail prices were cut seven times between mid-1953 and mid-1958, that wages were increased by an average of 40% in January 1959, and that the average rate of the agricultural tax in kind on grain was reduced from 22.4 to 10% in February.

Just as South Korea's economic rehabilitation is dependent on the United Nations and the United States, so is the rebuilding of North Korea supported by the Communist world. Of the equivalent of $754,350,000 in aid promised through 1957, including $360 million from China and $250 million from the USSR, $470,750,000 had been received by 1956. The Moscow radio reported that the volume of North Korea's foreign trade in 1959 would increase nearly three times over that of 1955. An agreement signed on March 17, 1959, contemplated Soviet delivery of equipment and materials amounting to nearly 500 million rubles ($125 million at the official rate), to be paid for by Korean goods.

In 1958 there were 2,380,000 students in 7,000 educational establishments, including 112,000 in technical schools and institutions of higher learning. Tuition-free compulsory primary education (inaugurated in 1956) was extended on Nov. 1, 1958, to include junior middle schools, for a total of 7 years. Tuition was abolished in schools of all levels beginning on April 1, 1959.

Repatriation Agreement.—Representatives of the Red Cross societies of Japan and North Korea met in Geneva from April 13 to June 24, 1959, to reach agreement on the problem of voluntary repatriation of Koreans in Japan. After much wrangling and vehement protests from the South Korean government, an agreement for repatriation was signed in Calcutta on Aug. 13, 1959. It provides that Koreans who wish to return to North Korea must submit applications to the Japanese Red Cross Society in person, with parents or guardians acting for minors, and that withdrawal of applications is permitted "until a certain time before embarkation." The Japanese side will assume all expenses up to the returnees' embarkation, while the North Korean side will pay all expenses thereafter and furnish repatriation ships. The agreement also states: "The Japanese Red Cross Society shall request the International Committee of the Red Cross to take such measures as the latter deems necessary and appropriate to ensure that the organization and operation of the system for registering persons wishing to return be fair, impartial and in conformity with the humanitarian principles." Repatriates leaving Japan for North Korea totaled 2,942 by December 28.

Post-Armistice Developments, 1959

Since the conclusion of the Korean Armistice Agreement in 1953 there has been no progress toward national unity or peace. The Neutral Nations Supervisory Commission, created to watch ports of entry for traffic in arms and troops, was deactivated in June 1956; and subparagraph 13(d) of the armistice agreement, restricting an arms buildup, was nullified in June 1957. The two sides make charges and countercharges of violations while arming themselves with deadlier weapons.

North Korean Communist authorities loudly demand withdrawal of all foreign troops so that Koreans can unite themselves peacefully through negotiations between North Korea and South Korea. The Rhee regime wants the United Nations forces to stay and advocates either unification by conquest or the holding of free elections under United Nations supervision in North Korea only. On Dec. 9, 1959, the U.N. General Assembly passed (54–9, with 17 abstentions) its customary resolution calling for the reunification of Korea.

North Korean armed strength was estimated at 350,000 men in 1959. All Chinese troops were reportedly withdrawn by Oct. 25, 1958, except for a small group attached to the Military Armistice Commission (MAC). In South Korea there were in 1959 about 650,000 men in the Korean forces, two United States divisions (including some Koreans) with supporting units, a Turkish brigade, and token or liaison units from a few other nations which had fought under the U.N. Command. On April 22, Lt. Gen. Carter B. Magruder was appointed to succeed Gen. George Decker as head of the U.N. Command, and on May 1, Maj. Gen. William S. Biddle replaced Rear Adm. Ira H. Nunn as senior U.N. Command member of the MAC.

Yongjeung Kim,
President, Korean Affairs Institute.

KORNBERG, Arthur, American biochemist: b. Brooklyn, N.Y., March 3, 1918. In 1959, the second consecutive year in which the Nobel Prize in medicine and physiology was awarded to Americans, Dr. Kornberg shared the prize of over $42,000 with one of his previous teachers, Dr. Severo Ochoa (q.v.).

Receiving a B.S. from the City College of New York in 1937 and an M.D. from the University of Rochester (N.Y.) in 1941, Kornberg entered the U.S. Public Health Service in 1942, becoming a medical director in 1951. He studied with Dr. Ochoa while he was a guest research worker at New York University's College of Medicine in 1946. Head of the Department of Microbiology at the School of Medicine of Washington University in St. Louis until a few months before he received the Nobel Prize, he had moved to Stanford University to become the executive head of the Department of Biochemistry.

In 1956 Kornberg found a commercially available bacterial enzyme which can be used to synthesize a chemical compound that appears to be identical with deoxyribonucleic acid (DNA). DNA is the genetic substance governing the transmission of hereditary qualities by allowing a cell to reproduce itself in its own image. In independent research at about the same time, Dr. Ochoa found an enzyme that would produce a compound apparently identical with ribonucleic acid (RNA). These two nucleic acids are the basic chemical compounds in producing and sustaining life and in passing on hereditary information. The Nobel

laureates were the first to synthesize them artificially from smaller organic molecules that are commercially available. Their work may ultimately throw some light on the problem of cancer and on the reproduction of certain kinds of viruses. (See also MEDICINE.)

KOZLOV, Frol Romanovich, first deputy premier of the Soviet Union: b. Loshchinino, Russia, Aug. 17, 1908. Amid growing indications that he was favored by Premier Nikita Khrushchev (q.v.) as his eventual successor, Kozlov was projected onto the world stage in 1959 by his two-week visit to the United States and his meetings with President Eisenhower.

WIDE WORLD

On his visit to the United States in July, Soviet Deputy Premier Kozlov (l.) inspects corn at Morris, Ill., farm.

Born of humble peasant stock, Kozlov began working at the age of 15 in a textile factory in Kasimov. Three years later, having joined the Communist organization, he attended a workers' school. In 1928 he entered Leningrad Polytechnical Institute, from which he was graduated as a metallurgical engineer. He then became supervisor of a steel plant in Izhevsk, and in 1944 went to Moscow to work for the party's Central Committee. After holding party posts in Kuibyshev Oblast and in the city of Leningrad, he became first secretary of the Leningrad Oblast in November 1953, following Khrushchev's rise to party leadership. Advancement for Kozlov followed rapidly. He was elected to the Presidium of the Supreme Soviet in 1954 and to the Presidium of the Communist Party's Central Committee in 1957, and became first deputy premier in March 1958. He reportedly played a key role in helping Khrushchev in 1957 to overcome a faction led by Georgi Malenkov, V. M. Molotov, and L. M. Kaganovich.

Kozlov arrived in the United States on June 28, 1959, to open the Soviet National Exhibition of Science, Technology, and Culture in New York City. On June 29 he escorted President Eisenhower on a preview visit of the show, and on July 1 met with the president in Washington for a discussion of Soviet-American relations, centering particularly on the Berlin question and the possibility of a summit conference. A nationwide tour took him also to San Francisco, Detroit, Chicago, and Pittsburgh, before his departure on July 13. Ten days later Kozlov reversed his role from guest to that of host, as he greeted Vice President Richard Nixon (q.v.) on his arrival in Moscow and accompanied him on a tour of the Soviet Union.

KUNITZ, Stanley Jasspon, American poet: b. Worcester, Mass., July 29, 1905. For his *Selected Poems, 1928–1958* Kunitz was awarded the 1958 Pulitzer Prize in poetry (announced May 4, 1959) —one of three major laurels which he gained during 1959. He also received grants from the National Institute of Arts and Letters and the Ford Foundation.

After attending Harvard University (B.A., 1926; M.A., 1927), Kunitz joined the reference-book publishing house of H. W. Wilson Company, where he was joint editor, with Howard Haycraft, of a number of biographical volumes, including *British Authors of the Nineteenth Century* (1936), *American Authors, 1600–1900* (1938), and *Twentieth Century Authors* (1942). During World War II he served in the Army as editor of *Ten Minute Break,* an Army news magazine, and as a noncommissioned officer in the information and education division of the Air Transport Command.

After the war, in addition to free-lance editorial work for H. W. Wilson Company (a supplement to *Twentieth Century Authors* appeared in 1955), Kunitz embarked on a teaching career. From 1946 to 1949 he taught at Bennington College in Vermont, and in 1949–50 he was a visiting professor of English at the New York State Teachers College in Potsdam. After 1950, besides conducting the Poetry Workshop of the New School for Social Research in New York City (1950–58), he held visiting professorships at the University of Washington (1955–56), Queens College, New York (1956–57), and Brandeis University (1958–59).

Kunitz' first volume of poetry, *Intellectual Things,* was published in 1930. His second volume, *Passports to the War: A Selection of Poems,* appeared in 1944. Although his work occasionally appeared in periodicals, he did not command a wide reputation until his manifold recognition in 1959. According to John Ciardi, a better-known contemporary poet, "Kunitz is certainly the most neglected good poet of the last quarter-century."

KURIL (KURILE) ISLANDS. A chain of some 30 islands and numerous islets and reefs extending from the tip of the Kamchatka Peninsula (Siberia) to within a few miles of Hokkaido, Japan. Area, about 5,700 square miles; est. pop., 15,000. In 1945 the Soviet Union took over the islands from Japan under the Yalta Agreement. Since 1947 the Kurils have been part of the Sakhalin Oblast of the Russian Soviet Federated Socialist Republic. Chief occupations are whaling, fishing, lumbering, sulfur mining, and hunting. The Soviet-Japanese peace agreement of 1956 deferred the question of permanent rights to Etorofu and Kunashiri (two of the larger southern Kuril Islands) and the smaller Habomai Islands and Shikotan Islands (off Hokkaido) to future negotiations. A Japanese request in 1958 for discussions on the islands was rejected by the USSR.

KUWAIT. See ARABIA.

LABOR. Two events dominated the United States labor scene in 1959: the industry-wide steel strike and the enactment of the Labor-Management Reporting and Disclosure Act of 1959.[1] Also, the first constitutional challenge of the 80-day injunction provisions of the Labor Management Relations (Taft-Hartley) Act of 1947 was brought before the Supreme Court during the lengthy steel walkout. Concern over automation and work practices, rather than direct economic improvements, appeared to dominate labor attitudes in collective bargaining, and a number of the year's important situations and contracts reflected this concern.

Labor-Management Relations.—Steel negotiations, continuing on plea of the president for two weeks past the July 1 contract expiration date, foundered on two issues: determination of the steel companies to resist an "inflationary" wage increase, and their insistence on revision of local work rules inhibiting "effective" manpower deployment and utilization. The ensuing strike, which began on July 15, lasted 116 days, the longest steel strike in the nation's history.

Despite stern warnings by the president that the national interest demanded a settlement, negotiations between the United Steelworkers of America and representatives of the 12 largest companies collapsed. Thereupon, on October 9, the president invoked the emergency provisions of the Taft-Hartley Act—the 17th such use of the law since it was enacted in 1947. A fact-finding board, headed by Dr. George W. Taylor of the University of Pennsylvania, was convened. During its hearings (October 12–18), the board took the unusual step of openly attempting to mediate the dispute. Although it succeeded in narrowing the issues separating the parties and in eliciting a new offer and counteroffer, the board in its report to the president on October 19 stated that there was not "any single issue of any consequence whatsoever upon which the parties are in agreement." The government then obtained a federal court order enjoining the strike for 80 days, but successive appeals by the union resulted in stays until November 7, when the Supreme Court ruled, 8–1, that the national welfare was endangered and that the injunction was constitutional.[2] The steelworkers were ordered back to work by the union two hours after the court's ruling was announced.

While the injunction was in litigation, Kaiser Steel Corp., one of the "big 12" bargainers, signed a separate contract with the union on October 26. Over a 20-month period, the agreement provides wage and benefit improvements estimated at 22.5 cents an hour, although no direct wage increase would be due until the second year. The union gave up the cost-of-living increase which might have been due in 1959, and limited 1960 wage escalation to 3 cents an hour. A 1960 wage increase will amount to 7 cents an hour, plus some increments between job classes. More important to the union was retention of the old work-rule clause. Work practices, however, would be reviewed by a joint committee. A second committee, tripartite in character, will develop a long-range plan for the "equitable sharing of economic progress." Similar contracts were later signed by the union with Detroit Steel and Granite City Steel.

After protracted bargaining negotiations, an agreement between the United Steelworkers and the remaining 11 major steel producers was finally arrived at on Jan. 4, 1960. The settlement provided for wage and benefit increases amounting to an estimated 39 cents per hour in stages over a 30-month period, with the first direct wage increase effective Dec. 1, 1960. The difficult problem of work practices was referred to a joint union-management committee for further study and recommendations. (See also IRON AND STEEL.)

The concern of labor with work practices and the job-loss threats of laborsaving devices was manifest in other situations. Armour and Co. and two unions—the United Packinghouse Workers and the Amalgamated Meat Cutters and Butcher Workmen—on August 31 established a tripartite committee to study the effects of technological change in the industry and to "consider for appropriate action a program of training" displaced employees. To finance the study, training, and planning, the company agreed to contribute 1 cent per hundredweight of total slaughter tonnage until a fund of half a million dollars is available.

On the west coast, the Pacific Maritime Association, eager to introduce more efficient cargo-handling equipment on the docks and to reduce work-gang sizes, agreed on July 28 with the International Longshoremen's and Warehousemen's Union (Ind.) to establish a $1.5 million fund through employer contributions. In return for a freer hand in cutting labor costs, the employers agreed to devise a plan for sharing the savings thus achieved, the fund to be a down payment on the sharing.

East and Gulf coast stevedores, represented by the International Longshoremen's Association, resisted employer demands for more extensive use of laborsaving machinery, and struck on October 1. Five days later the president created a fact-finding board, and a Taft-Hartley injunction was obtained ending the strike in all ports within 24 hours. Beginning December 1, settlements were reached providing for a 3-year contract with total economic benefits over the term of the contract amounting to 41 cents per hour. On work rules, 20-man gangs were retained, but the union agreed to the introduction of new equipment. The issue of special fees for preloaded containers was referred to arbitration.

A four-month strike by the United Glass and Ceramics Workers Union against the Pittsburgh Plate Glass Co., mainly over work rules and work assignments, ended on February 11 with wage and pension increases and an agreement to arbitrate the work issues. A 51-day strike by 2,000 glass moldmakers against the Glass Containers Manufacturers Institute ended on November 2 with the signing of a new contract.

The Lithographers Union and employers continued a joint commission dedicated to facilitating introduction of automated equipment in the industry.

Fearing heavy cutbacks in employment because of automation, the United Automobile Workers Union at its convention in mid-October proposed a permanent government commission on technological change "to insure that the social gains of technological progress are fairly shared."

Apart from the steel negotiations, the most important labor-management dispute concerned the nation's railroads and a score of unions representing nearly 1 million railroad employees. Although the unions had requested wage increases averaging about 25 cents an hour, and employers had demanded cuts of 15 cents, the really contentious issue as contracts expired on November 1 was the carriers' determination to change what

[1] Public Law 86–257, signed by President Eisenhower on Sept. 14, 1959, and also referred to as the Landrum-Griffin Act and the Labor Reform Act of 1959.

[2] The union had challenged the order on the ground that no national emergency affecting health or welfare existed and that the injunctive provisions of Taft-Hartley were unconstitutional because they called for court intervention in a wholly administrative action to temporarily stop an otherwise legal strike.

they characterized as outmoded and costly work rules—known popularly as "featherbedding." (Provisions of the Railway Labor Act can prevent strike action for 60 days following appointment of a presidential board of inquiry.) In this situation, too, the unions' apprehension over declining employment was a motivating factor in their adamant position on the rules matter. Employer resistance was strengthened by a group strike insurance plan under which struck lines could be reimbursed for a portion of their daily fixed charges.

Negotiations in certain industries which traditionally follow the steel bargaining pattern—notably metal containers and aluminum—were suspended temporarily while work continued. However, a strike by the unaffiliated Mine, Mill, and Smelter Workers Union and by the United Steelworkers against major copper smelters and refiners was almost coextensive with the steel stoppage. The container and aluminum negotiations were resumed in December, and agreement was reached early that month on the basis of the Kaiser contract's economic terms. On November 22 and 28, respectively, pattern-setting 20-month contracts were signed by the United Steelworkers with the Kennecott Copper Corporation, and by the Mine, Mill, and Smelter Workers with the American Smelting and Refining Company. The contracts called for wage and other benefit increases valued at about 22 cents per hour.

Other significant labor-management negotiations in 1959 included the following:

Coal.—A $1-a-day increase for about 20,000 hard-coal miners, effective February 1, was negotiated by the United Mine Workers of America; the agreement also increased royalty payments to the welfare and retirement fund and vacation payments. Efforts in March and April by the UMW to impose terms of the 1958 soft coal contracts on independent "truck mines" in Kentucky, Tennessee, and West Virginia resulted in extensive violence reminiscent of early organizing days in the industry. National Guardsmen were used to maintain order in Kentucky, and the National Labor Relations Board (NLRB) obtained an injunction against the union on April 30.

Rubber.—Between April 15 and May 1, major rubber companies and the United Rubber Workers agreed to improvements in pensions, insurance, supplemental unemployment benefits, and other nonwage items, but not without strikes affecting Goodrich, Firestone, and United States Rubber. In late August and early September, the same parties agreed to a 10-cent-an-hour wage increase. About 156,000 workers were involved.

Textiles.—Pay scales for an estimated 300,000 workers in Southern plants received their first upward change since 1956.

Clothing.—Leading manufacturers of men's shirts, pajamas, and cotton garments agreed on May 28 with the Amalgamated Clothing Workers to a 7.5-cent hourly wage increase and various fringe benefits for about 100,000 workers. Approximately 50,000 employees making women's and children's outer garments in four Eastern states, members of the International Ladies' Garment Workers' Union, received a new 3-year contract on May 4. It called for a wage reopener when prices rise 5% over the December 1957 level, severance pay, and extension of overtime pay to incentive workers.

Construction.—Thousands of construction workers, through various area settlements, in the spring received exceptionally large wage increases in newly negotiated, usually multiple-year contracts. Terms in many instances called for annual increases of from 18 to 25 cents an hour, as well as fringe benefits.

Hospitals.—Significant chiefly for their rarity were strikes in 7 New York City voluntary hospitals in May and June by nonprofessional employees, represented by the Retail, Wholesale, and Department Store Union, for improved working conditions and pay. They secured indirect recognition, a grievance committee, and wage improvements. The Hotel and Allied Service Employees (an affiliate of the Building Service Employees), operating in 37 profitmaking hospitals in New York City, obtained a 3-year contract on June 25, calling for wage increases and other benefits.

Excluding construction and service industries, wage increases negotiated during the first half of 1959 for workers covered by major agreements (1,000 or more employees) averaged between 7 and 8 cents per hour, Bureau of Labor Statistics figures revealed.

WIDE WORLD

Congressmen Phil M. Landrum (left) and Robert P. Griffin, in Washington on August 13, celebrate House clearance of their jointly sponsored labor reform bill. A compromise bill, incorporating features of the Landrum-Griffin measure and the Senate's milder Kennedy-Irvin bill, was enacted into law and signed by President Eisenhower on September 14.

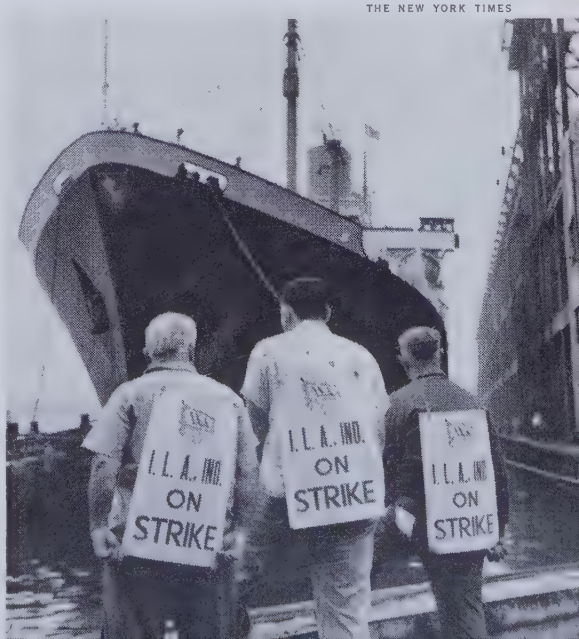
Strike activity totals for the year, swollen abnormally by half a million steelworkers, reached 68 million participants and 1,850,000 man-days lost for the 3,900 stoppages in effect in 1959.

Labor Force Trends.—Labor force growth of about 600,000 in 1959 continued below its long-term trend for the third consecutive year. However, growth during the latter half of 1959 averaged about 750,000 persons. Long-range projections had anticipated an increase of 1 million in 1959. Over-the-year expansion that did occur was influenced by the rise in the number of persons in the usual working-age groups. The labor force was also characterized by an expanded participation rate for married women and a lower rate for teenagers and for men 65 and over.

Unemployment during 1959 reflected two conflicting influences: economic recovery and the steel strike. During the first half, unemployment declined from depression levels to a seasonally adjusted June total of 3.4 million (4.9% of the labor force); and long-term unemployment (15 weeks or more) began to diminish in the spring of 1959.

Members of the International Longshoremen's Association, which went on strike in Atlantic and Gulf ports on October 1, picket a New York pier. Strikers were recalled to work on October 9, following a Taft-Hartley injunction.

THE NEW YORK TIMES



TALBURT IN THE NEW YORK WORLD-TELEGRAM AND SUN

"Now Look Where They're Headed!"

In April, the latter category stood at 1.4 million, down one-half million from the recession peak of the previous April. By the end of the year, long-term joblessness had leveled off to about 750,000. The steel strike, which commenced on July 15,

SELECTED LABOR FORCE DATA
(In thousands)

	October 1959	October 1958	Average 1958
Civilian labor force	70,103	69,111	71,284
Employed	66,831	65,306	63,966
Agricultural labor	6,124	6,404	5,844
Nonagricultural labor	60,707	58,902	58,122
Unemployed	3,272	3,805	4,681
Seasonally adjusted rate[1]	6.0	7.1	6.8
Unemployed by duration:			
Less than 5 weeks	1,607	1,522	1,833
5 to 14 weeks	939	892	1,397
15 to 26 weeks	333	581	785
27 weeks and over	393	811	667
Average duration (weeks)	13.1	16.6	13.8

[1] Percentage of civilian labor force unemployed. (Source: U.S. Department of Labor, Bureau of Labor Statistics.)

caused unemployment to rise to a seasonally adjusted October rate of 6%; but by the end of 1959, with the resumption of steel production during the period of the Taft-Hartley injunction, the rate had dropped to approximately 5%.

Trade Union Developments.—Total trade union membership in the United States was estimated by the Bureau of Labor Statistics at 17.0 million, with an additional 1 million Canadian members of these same organizations. Little organizational work was accomplished in 1959. Unions operating in the mass-production industries—especially those in which automated equipment was in use or about to be increased in use—were keenly aware of the growing proportion of technicians and other white-collar employees as potential members. But as yet no new organizing appeal to attract these groups in appreciable numbers had been devised. Large-scale organizing drives among production workers, shrinking in absolute and relative numbers, was impeded by employment uncertainties as well as by failure of the AFL-CIO effectively to resolve its jurisdictional difficulties (see also American Federation of Labor and Congress of Industrial Organizations).

There were, however, specific manifestations of expedients employed to this end. On January 18, the United Automobile Workers and the Detroit Building Trades Council signed the first local area jurisdictional agreement which, in addition to specifying work "rights," pledged "friendly and cooperative relationships."

Seven railroad shop-craft unions reached agreement during the summer of 1959 to establish machinery for final and binding decisions relating to jurisdictional matters.

On January 7, the National Maritime Union and the Seafarer's International Union put an end to years of belligerent rivalry by setting up a committee to resolve differences and agreeing to withdraw charges each had filed against the other before the NLRB.

A merger between the Marine Engineers Beneficial Association and the Brotherhood of Marine Engineers was consummated in May.

The International Association of Machinists and the United Auto Workers continued their cooperative arrangements in aircraft bargaining, and in August formulated joint demands for presentation to the industry.

Late in October the International Brotherhood of Longshoremen voted to merge with its rival, the International Longshoremen's Association. The IBL had been established by the old American Federation of Labor after expulsion of the ILA for corrupt practices. The ILA in September had been voted into probationary AFL-CIO membership.

In general, however, the greatest hope for resolution of interunion differences and further merger of unions in the same or related fields, as well as for realistic consideration of an organizational drive by the AFL-CIO, lay in the convention scheduled by the parent body for 1960 to consider such matters.

Many unions in 1959 were faced with the high cost of institutional operations and administration. Such organizations as the Auto Workers, the Ladies' Garment Workers, the Shoe Workers, the Railroad Clerks, the Retail Clerks, the Office Employees, the Newspaper Guild, and the Communications Workers all raised dues.

Continued investigation by the Senate Select Committee on Improper Activities in the Labor or Management Field turned up, among a relatively small number of organizations, diverse examples of internal union corruption, undemocratic practices, and employer-union officer collaboration to write "sweetheart" contracts to the detriment of the workers affected. A report of the committee,[3] which ended its third and probably final year of operation, cited in particular collusive action between officials of two locals of the Meat Cutters and Butcher Workmen and of food processing firms in the New York City area. It also detailed what it termed a "shocking" story of "betrayal of union members and their families" by Teamster President James R. Hoffa and some of his principal aides, in connection with Teamster health and welfare funds in the Midwest.

Meanwhile, the three monitors established by a federal court to oversee the Teamsters union tightened, through court action, their authority over internal union affairs and their right to institute reforms.

Federal Legislation.—The Labor-Management Reporting and Disclosure Act of 1959 in a real sense grew out of the disclosures of corruption by the Senate Select Committee on Improper Activi-

[3] U.S. Senate Select Committee on Improper Activities in the Labor or Management Field, *Second Interim Report*, Aug. 5, 1959.

ties in the Labor or Management Field. In its essential features, the law:

(1) Guarantees certain basic union membership rights, such as voting and speaking on union affairs, and freedom from arbitrary discipline.

(2) Requires all labor organizations to file with the secretary of labor, on penalty of court action, constitutions and bylaws, detailed financial reports, and union-officer reports on certain personal financial dealings. Members may sue in federal court to enforce access to basic records.

(3) Limits trusteeships of parent unions over subsidiary units by requiring filing of accounting and other information with the secretary of labor at regular intervals; and limits trusteeships to control of corrupt or undemocratic procedures.

(4) Stipulates method of union elections and provides, under certain conditions, for a complaint to the secretary of labor, who may bring federal court action.

(5) Permits suits by members for an accounting; requires bonding of officers and certain employees; proscribes, under limits, holding of office by Communists or felons; makes illegal employer payments to unions or their representatives to gain influence; and bans extortion picketing.

The law also amends the Taft-Hartley Act to give states jurisdiction in cases over which the NLRB declines jurisdiction; allows economic strikers to vote in NLRB elections; strengthens the secondary boycott provisions; outlaws "hot cargo" clauses (an agreement to prevent the transporting of nonunion goods) in contracts; and makes organizational and recognition picketing illegal under certain conditions.

On May 19, President Eisenhower signed an amendment to the Railroad Retirement and Unemployment Insurance acts, raising pension benefits for railroad workers 10% and maximum unemployment insurance benefits by 20%.

State Legislation.—Workmen's compensation benefit increases were passed in 29 states in 1959. Compulsory coverage for farm workers was voted in California. The trend toward radiation disease coverage continued, with 5 states enacting relevant amendments and 9 increasing the time limit for filing claims in such cases.

California and Ohio adopted fair employment practices acts, making a total of 16 states with such legislation. Connecticut, Oregon, and Wisconsin extended their fair employment laws to cover age discrimination.

New York passed a measure similar to the Landrum-Griffin Act. North Dakota banned convicted criminals and most felons from holding union office. Wisconsin repealed its 1955 law prohibiting political contributions by unions.

Equal pay for women was enacted in Hawaii, Ohio, and Wyoming, making 20 states with some form of this requirement.

North Carolina approved its first minimum-wage law, and Maine expanded the coverage of its statute. Minimum wages were increased in Alaska, Vermont, New Hampshire, Connecticut, and Massachusetts.

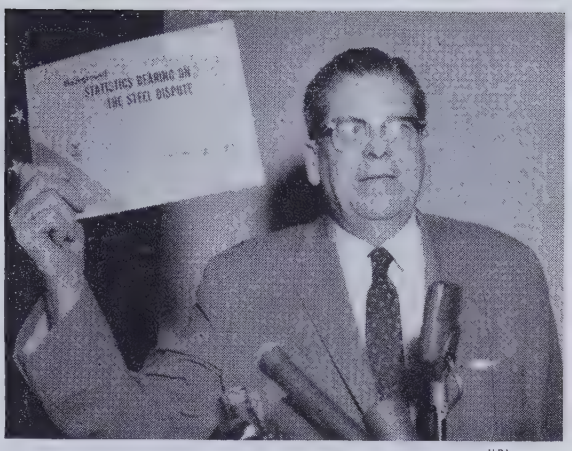
Labor and the Law.—In addition to the steel injunction case discussed earlier, the following 1959 Supreme Court decisions were significant:

A state antitrust law may not be invoked against a contract provision setting a minimum truck rental for owner-driven vehicles leased to carriers, because such a contract establishes a wage agreement rather than price-fixing (*Teamster Local 24* v. *Oliver,* January 19).

A state court cannot award damages for peaceful picketing, even though a state law is violated and the NLRB has refused jurisdiction (*San Diego Building Trades Council* v. *Garmon,* April 20).

Employee committees, even if established by employers, are labor organizations if they bargain over working conditions and have majority approval (*NLRB* v. *Cabot Carbon Co.,* June 8).

A unilateral wage increase given after a refusal-to-bargain complaint is filed can be considered by the NLRB in holding that an employer refused to bargain (*NLRB* v. *Fant Milling Co.,* June 15).



UPI

Secretary of Labor James P. Mitchell, at a press conference in Washington on August 19, holds a copy of his report on wages, profits, and prices in the steel industry.

On May 14, the NLRB announced it would exercise jurisdiction over nonresidential hotels and motels which gross at least $500,000 annually. Important NLRB cases included rulings that: a minority union cannot contract for exclusive bargaining rights (*Bernhard-Altmann Texas Corp.,* February 6); a union cannot refuse to deal with an employer representative merely because he was once an officer of that union (*International Ladies' Garment Workers Union, Northeast Department, and others,* February 13); employers may not make a lockout intermittent in order to defeat employees' claims to unemployment insurance (*Great Falls Employers' Council,* April 29); expiration of a contract does not relieve a union of duty to arbitrate grievances which arose during life of the contract (*Local 611, International Chemical Workers Union,* June 5).

LANDOWSKA, Wanda (80?), Polish harpsichordist: b. Warsaw, Poland, July 5, 1879 or 1877; d. Lakeville, Conn., Aug. 16, 1959. Landowska's numerous recordings of harpsichord music remain a living monument to her unique artistry and complete technical mastery, representing half a century of devotion to the harpsichord and its music. Her performances of Baroque music were, as Nicolas

EUROPEAN

Wanda Landowska, famous harpsichordist, died on August 16.

Slonimsky well wrote, "notable in their balance between classical precision and freedom from rigidity, particularly in the treatment of ornamentation."

She was graduated from the Warsaw Conservatory in 1893 and continued her studies under Moritz Moszkowski and Heinrich Urban in Berlin. She then went to Paris in 1900, joining the staff of the Schola Cantorum, and from Paris toured Europe as a pianist. Her desire to revitalize the performance of Baroque harpsichord music soon led her to devote her remarkable energy to propagandizing for that instrument. In 1912 she had a modern harpsichord built for her in Paris by Pleyel et Compagnie. She was invited in 1913 by August Kretzschmar to give master classes in harpsichord playing at the Berlin Hochschule für Musik.

She and her husband, Henri Lew, a writer on folklore whom she had married in 1900, were interned in Germany during World War I, at the end of which he was killed in an accident in Berlin. After the war, Landowska taught in Switzerland briefly before returning to Paris and buying, in nearby Saint-Leu-la-Forêt, a villa that she converted into a school of old music. She also taught at the Conservatory of Fontainebleau.

Wishing not only to restore to its original instrument the harpsichord music of such composers as François Couperin, Jean-Philippe Rameau, Domenico Scarlatti, Johann Sebastian Bach, and George Frederick Handel, but also to evoke a modern repertoire for the instrument, she began to commission compositions from well-known composers. The best known of these pieces, with dates of their first performances (with Landowska as soloist) were Concerto for Harpsichord and Chamber Ensemble, by Manuel de Falla (Nov. 5, 1926), and *Concert champêtre,* by Francis Poulenc (May 3, 1929).

Landowska first played in the United States at Philadelphia, with Leopold Stokowski conducting the Philadelphia Orchestra, on Nov. 20, 1923. She returned to the country frequently until 1932. At the time of the German invasion of France in 1940, Landowska fled, abandoning her villa and her collection of harpsichords, and reached the United States in 1941. Later, having settled at Lakeville, Conn., she devoted herself chiefly to recording and teaching, making only occasional recital and concert appearances. Her last public performance was in 1954 at the Frick Museum in New York City.

Landowska's recordings include Bach's *The Well-Tempered Clavier* and *"Goldberg" Variations* and *The Art of the Harpsichord* and *Treasury of Harpsichord Music,* as well as piano performances of sonatas by Mozart and Haydn (the latter released in the summer of 1959). She composed a number of works for strings, harpsichord, piano, and voice, and was the author of many articles and books on musical subjects, including *Bach et ses interprètes* (Paris 1906) and, with Henri Lew, *La musique ancienne* (Paris 1909; Eng. tr., *Music of the Past,* New York 1924).

For additional information on and criticism of Landowska, consult Bernard Gavoty's *Wanda Landowska* (Geneva 1957) and Roland Gelatt's *Music Makers* (New York 1953).

HERBERT WEINSTOCK,
Music Editor and Reviewer; Author of "Music as an Art" and other works.

LANGER, William (73), United States senator: b. near Everest, N.Dak., Sept. 30, 1886; d. Washington, D.C., Nov. 8, 1959. A Republican who frequently opposed his own party on major issues, "Wild Bill" Langer four times won a seat in the U.S. Senate, where he established himself as a table-thumping orator on behalf of isolationism and farm interests.

Earning a law degree from the University of North Dakota and admission to the bar of his home state before he was old enough to practice law, Langer went on to study at Columbia University, graduating in 1910 as president of his class. He returned to North Dakota to practice law, helping Arthur C. Townley[1] to found the Non-Partisan League in 1915. With the league's support, he became state attorney general in 1916. After defeat in the gubernatorial race of 1920 he engaged in a successful law practice in Bismarck until winning the governorship in 1932. Although he was removed by the state Supreme Court for allegedly soliciting political contributions from federal employees, he successfully appealed the conviction in 1935, was re-elected governor in 1936, and U.S. senator in 1940. Here too he surmounted an initial setback, this time in the form of a petition that he not be seated and a vote supporting the petition by the Senate Privileges and Elections Committee. In 1942 the Senate finally voted to seat him.

A thoroughgoing isolationist, he opposed passage of the lend-lease bill as well as extension of the draft in 1941, and renewal of the Reciprocal Trade Agreement Act in 1943–44. He voted against the Bretton Woods Monetary Agreement in 1945, against ratification in 1945 of the United Nations Charter, against Greek-Turkish Aid in 1947, against the $3,750 million loan to Great Britain in 1946, and against the North Atlantic Security Pact in 1949.

On domestic issues he favored statehood for Alaska, higher pay for postal employees and serv-

[1] On Nov. 7, 1959, the day before Langer's death, Arthur C. Townley (age 79) was killed in an automobile accident at Makoti, N.Dak. The Non-Partisan League, which he founded, opposed the rail and grain interests with the purpose of raising the farmer's economic status. It worked for state ownership of terminal elevators, flour mills, and packinghouses, and for exemption of farm improvements from taxation. Some of these and other goals were realized through legislation in 1919.

icemen, and a farm program closely following that of the Non-Partisan League, which he helped resuscitate after the depression of the 1930's, and which he sponsored until 1956 when the league filed its candidates as Democrats. In championing the farmer, Langer placed himself in opposition to Ezra Taft Benson, secretary of agriculture in President Eisenhower's cabinet. His opposition to his own party was evidenced in other ways, as for example his vote in 1959 against the appointment of Lewis L. Strauss as secretary of commerce.

In 1958 the North Dakota Republican convention failed to endorse Langer for re-election to the Senate. Campaigning on his own in the primary, he won every county and in the election was returned to the Senate for the fourth time.

LANGUAGE. See LINGUISTICS.

LAOS. A land-locked kingdom of Southeast Asia. Estimated area, 91,500 square miles; pop. (est. 1958), 1,690,000. Over half the population are Lao, a people of Thai stock. Thai, Meo, Kha, and other tribesmen of Indochinese or Chinese origin comprise most of the remainder. Lao is the official language, although French is commonly used in commerce and government. Vientiane (est. 80,000) is the chief city and administrative capital. Luang Prabang (est. 10,000) is the royal residence. Over 90% of the population is rural.

Government.—Laos is a constitutional monarchy. Crown Prince Savang Vatthana acceded to the throne on Nov. 4, 1959, following the death of his father, King Sisavang Vong, on Oct. 29, 1959, and assumed the royal name of Setha Khatya. The ministry is responsible to the National Assembly, consisting of 59 members elected at least every 5 years by universal suffrage. Party seating following the special elections of May 4, 1958, was: Rally of the Laos People, 36; Neo Lao Hak Xat (Communist), 9; Santithab (neutralist), 7; Democrats, 3; National Union, 2; unaffiliated, 2. Phoui Sananikone, of the pro-Western Rally of the Laos People, held the premiership from Aug. 18, 1958, to Jan. 1, 1960. On January 7, Kou Abhay was named to head an interim government, pending new elections.

The 1958 special elections followed a compromise agreement of 1957 between the Laotian government and the Communist-led Pathet Lao movement, whereby the Pathet Lao relinquished its control of the two northern provinces of Sam Neua and Phong Saly, agreed to the integration of its forces with the Royal Laotian Army, and obtained legal recognition as a political party. Following the unification of the country, and at the request of the Laotian government, the three-nation International Control Commission (set up under the Geneva agreements of 1954 ending the Indochinese War) suspended operations in July 1958.

The Geneva agreements of 1954 prohibited the establishment of foreign military bases in Laos or Laos' participation in aggressive military alliances. France was permitted to maintain a military training mission in Laos and has maintained such a mission, though of considerably smaller size than permitted. The United States, which supports the Laotian armed forces financially and also provides weapons and other aid, has a program evaluation office of some 200 persons and a training mission of about 100. Laos is not a member of the Southeast Asia Treaty Organization (SEATO), although a separate protocol to the SEATO treaty guarantees the defense of Laos.

Education and Religion.—An estimated 80% of the population is illiterate. In 1958 there were 770 primary schools (77,133 pupils), and 7 secondary schools (1,984). University education is obtained abroad, mainly at Saigon (South Vietnam) or in France. Buddhism is the chief religion and is a major element in the Laotian way of life.

Finance.—The budget for 1957 estimated expenditure at 1,145 million kip; revenue, 945 million (in October 1958 the kip was devalued from 35 to 80 kip per U.S.$1, and made freely convertible). The United States provided aid to Laos totaling $190,281,000 in the period from Jan. 1, 1955, to June 30, 1959, mostly for defense support. Technical assistance programs in agriculture, transport, social services, and other spheres are supported by the U.S. International Cooperation Agency, France, the Colombo Plan, and the United Nations.

Production.—Over 90% of the population is engaged in subsistence agriculture. Cultivation techniques are primitive and the country is a food deficit area, despite the low population density. Output of rice, the staple of diet, totaled 1,100 million pounds in 1957–58 (estimated average output, 1950–55: 970 million). Other crops are maize (average annual output about 12,000 metric tons), peanuts, coffee, tea, cotton, tobacco, ramie, beans, pimento, and sugar. Opium is grown by tribesmen in the north. Cattle and other livestock are raised. The vast forests yield teak, lumber, bamboo, and other products. Estimated output of tin concentrates in 1958 was 600 metric tons. The few industries include sawmills, rice mills, tanneries, woodworking, ships, and charcoal ovens. Handicraft items are produced in households or in small shops.

Foreign Trade.—Exports in 1958 totaled 54.8 million kip; imports (financed largely by United States aid), 1,040.9 million. Chief exports were tin concentrates (19.2 million kip), wood and lumber, and plants for medicine and perfume; chief imports: foodstuffs, textiles, transportation equipment, and other manufactures. Laos' chief trading partners are Thailand, South Vietnam, Japan, France, and the United States.

Transportation and Communications.—Laos has no railroads. Road transport is extremely primitive and entirely lacking in many areas; surfaced roads total some 1,200 miles, mainly in the south. The Mekong River is an important means of transport for bulk cargo. Most of Laos' foreign trade passes through Thailand and South Vietnam. Air Laos provides internal services and connections with nearby capitals. Passenger cars numbered 4,629 in 1958; telephones, 550.

Principal Events, 1959.—The 1957 compromise agreement between the Communist-led Pathet Lao movement and the Vientiane government appeared shattered in 1959, when the regime of Premier Phoui Sananikone pressed forward its anti-Communist program, and the Communists once again took up arms against the Royal government. The tougher policy against communism was inaugurated in July 1958, with the ouster of the Neo Lao Hak Xat from the coalition government. At the premier's request, the National Assembly on Jan. 14, 1959, voted to give the premier special powers to rule for a year without the assembly. On January 24 the premier reorganized his cabinet to include army officers and several members of the Committee for the Defense of the National Interest, a newly organized group dedicated to furthering economic and political reform and combating communism. On February 11 the Laotian government renounced the Geneva agreements of 1954, which had ended the Indochinese War and had barred the establishment of foreign bases in Laos. In mid-May the Laotian Army sought to incorporate two remaining Pathet Lao battalions, but was met with refusals on the part of the battalions' commanders. One of the battalions was forced to surrender; the other escaped, and in the ensuing pursuit by the army, several minor clashes occurred.

The implementation of Premier Phoui Sananikone's anti-Communist program evoked a sharp reaction by the neighboring Communist regime of the Democratic Republic of Vietnam (North Vietnam). In late December 1958 and early January 1959 the Vientiane and Hanoi governments accused each other of frontier violations in the poorly marked border area of central Laos. Laos' renunciation of the Geneva agreements was as-

Laotian government soldier stands guard over Communist-led rebels captured in Sam Neua, northern Laos, in September.

WIDE WORLD

sailed by North Vietnam (as well as by Communist China) as evidence that Premier Phoui Sananikone's regime had abandoned neutrality and placed Laos under United States domination. Following the clashes in mid-May between the escaping Pathet Lao battalion and the Royal Army, North Vietnam and Communist China repeated their previous demands for the reactivization of the three-nation International Control Commission. The Laotian government, however, declared that the mission's purpose had been fulfilled and its reactivization would constitute interference in Laotian internal affairs.

On July 16, reconstituted Pathet Lao forces opened an attack in Sam Neua, seizing several outposts lightly manned by the Royal Army. Before the end of July, rebel operations had spread to Phong Saly, with the apparent objective of regaining control of the two northern provinces given up by the Pathet Lao group under the 1957 compromise agreement. According to reports by the Laotian government, the rebels consisted of newly expanded forces equipped by North Vietnam. By early August, reinforced Royal Army forces had recaptured most of the posts in Sam Neua. In mid-August, however, there were reports of minor Pathet Lao activity in the central provinces of Savannakhet and Thakhek, and on August 23 a rebel thrust penetrated to within 50 miles of Vientiane, giving rise to some panic in the capital.

Meanwhile, with the agreement of France, Laos in late July requested aid from the United States to strengthen the Laotian Army. In early August it was reported that the number of United States technicians and training advisers in Laos would be increased. On August 17 the Soviet Union charged Laos with violating the Geneva agreement by permitting the establishment of a United States military base in Laos. The United States termed the Soviet accusation a gross distortion of the facts. On August 26 the U.S. State Department announced that special aid (mainly small arms, uniforms, and transport equipment) would be rushed to Laos to permit the expansion of the Laotian Army from about 25,000 to 29,000, and the first shipment of such aid arrived in Vientiane by airlift on August 31.

A second large-scale Pathet Lao offensive began on August 30 and resulted in the rebel capture of several score villages in Sam Neua, including the posts of Moung Het and Xien Kho. Government spokesmen charged that the rebel attack was aided by artillery fire from the North Vietnamese border and that North Vietnamese troops were participating directly in rebel operations. On September 4, in a cablegram to U.N. Secretary General Dag Hammarskjöld, Laos accused North Vietnam of "flagrant aggression," and appealed to the United Nations to send an emergency force to help defend Laos. The U.N. Security Council voted on September 8 to send a four-nation investigation subcommittee to Laos to inquire into the charges of aggression. The USSR, which had opposed the Security Council action, on September 14 called for an international conference to consider the problem of Laos within the scope of the Geneva agreements. The Soviet proposal was rejected by the United States on September 15 and by Britain on September 22.

The United Nations investigation subcommittee arrived in Laos on September 15, studied evidence submitted by the Laotian government, sent teams to Sam Neua and other battle zones, and departed from Laos on October 13. In its report of November 6, the subcommittee stated that evidence "did not clearly establish whether there were crossings of the frontier," although there was some evidence of North Vietnamese weapons and materials support of the rebels. At the request of the Laotian government, Hammarskjöld visited Laos from November 12–19. On Hammarskjöld's initiative, a United Nations "presence" was temporarily established in Laos in the person of Sakari S. Tuomioja of Finland, who arrived on November 17. Tuomioja's ostensible purpose was to conduct a survey of Laos' economic needs, but it was hoped that his presence in the country would tend to allay the conflict.

Beginning with the arrival of the United Nations investigation subcommittee, rebel activity had diminished considerably. On September 27, government forces recaptured Muong Het, taken by the rebels in their drive of August 30. In late September and October a few rebel raids took place in the southern provinces, where the rebels had enlisted the Kha tribesmen as allies. These raids were on a minor scale, however, and rebel efforts were reported to have shifted mainly to propaganda activities in the rural areas.

Rejecting pressures by army leaders and militants of the Committee for the Defense of the National Interest for more aggressive action against the Pathet Lao, Premier Phoui Sananikone ousted several top military men and members of the committee from his cabinet on December 15. On December 18, at the behest of the premier, the National Assembly voted to prolong its mandate (scheduled to expire on December 25) until the holding of new national elections in April 1960. However, following the death on December 29 of Katay D. Sasorith, former premier and president of the Rally of the Laos People, Premier Phoui lacked sufficient support to withstand the Committee for the Defense of the National Interest, and resigned on Jan. 1, 1960. The army then took over control until January 7, when King Setha Khatya named Kou Abhay to head an interim government, pending the holding of elections early in the year.

LATIN AMERICA. See INTER-AMERICAN AFFAIRS; articles on the Latin American countries; and the Index entry, *Latin America.*

LATIN AMERICAN LITERATURE. The most significant publishing in Latin American is done in Mexico by the Fondo de Cultura Económica, whose publications are of such a scope (104 titles in 1958) as to make it an extraordinary vehicle of cultural internationalism. Important Latin American literary periodicals include *Cuadernos Americanos* (published in Mexico), *Sur* (Argentina), *Cuadernos* (France), and three Puerto Rican magazines: *Asomante, La Torre,* and *Revista del Instituto de Cultura Puertorriqueña.*

Four important Latin American writers died in 1959: Luis Palés Matos (February 23), José Vasconcelos (June 30), Ventura Garcia Calderón (October 28), and Alfonso Reyes (December 27). They were, respectively, from Puerto Rico, Mexico, Peru, and Mexico.

Novels, Short Story, and Drama.—Many important titles were added to the Latin American bibliography in 1959. The current trend in fiction is to depart from *criollismo* (that is, regional literature which is realistic and sometimes naturalistic, and which emphasizes native characters and backgrounds) and to use themes with a more universal point of view. However, the economic and political strife characteristic of Latin American history is always present in fiction, and among the best novels of the year were those which dealt with the

drama of men struggling against various tyrannies.

El sol a plomo by the Cuban, Humberto Arenal, is in this category. This short novel, translated into English as *The Sun Beats Down*, depicts an episode of the recent Castro revolution in Cuba. *El laberinto* by Puerto Rican novelist Enrique Laguerre is rich in psychological complexities, set against the background of the Spanish-speaking minority in New York City, and the fight for freedom in the Caribbean area. In *Muertes de perro*, the Spaniard, Francisco Ayala, who has lived in Latin America for many years, gives a vivid description of a typical Latin American dictatorship.

The cultural flowering in Puerto Rico is particularly evident among its playwrights and short story writers. Names of promise in the younger generation include Francisco Arriví, Abelardo Díaz Alfaro, José Luis González, Pedro Juan Soto, and René Marqués. Marqués contributed *Los soles truncos* to the Festival of the Americas, held in the summer in Chicago. The production, presented both in English and in Spanish, was warmly received.

Two recent anthologies of short literary pieces are of merit. The Chilean, María Flora Yáñez, compiled *Antología de los jóvenes cuentistas chilenos*, published in 1958. René Marqués' *Cuentos puertorriqueños de hoy* appeared in 1959.

Poetry.—Latin American poetry was well-represented during the year, and literary magazines published work of the younger poets beside that of the better-established names. Dora Isella Russell of Uruguay is one of the most original and sensitive of contemporary poets, and Cecilia Meireles of Brazil is a writer of subtle and delicate verse. The Chilean, Pablo Neruda, published *Estravagario*, a well-balanced combination of poetry and illustrations. The Cuban, Nicolás Guillén, one of the outstanding "nativist" poets using Negro imagery and rhythms, published *La paloma de vuelo popular: Elegías.*

Following the death of Luis Palés Matos in February, Federico de Onís undertook a critical study of the late Puerto Rican poet's works. In addition, the periodicals *Asomante* and *La Torre* dedicated special issues to Palés Matos.

Nonfiction.—The second volume of Alberto Zum Felde's monumental *Índice crítico de la literatura hispanoamericana* appeared in 1959. (The first volume was published in 1954.) Zum Felde, a Uruguayan, devotes his new work, entitled *La narrativa*, to fiction. The Spaniard, Salvador de Madariaga, released *Presente y porvenir de hispanoamérica.* The Colombian, Germán Arciniegas, wrote a vivid interpretation of Latin American culture through its great men; the volume is entitled *América mágica, los hombres y los meses.* Chilean critic Ricardo Latcham brought out *Estudio sobre la literatura hispanoamericana.*

National literatures and other aspects of national cultures were examined by Luis Alberto Sánchez in *El Perú: Retrato de un país adolescente*, and by Cintio Vitier in *Lo cubano en la poesía.* The author of this article examines the social, literary, and artistic aspects of Puerto Rican culture in *Panorama de la cultura puertorriqueña.* Concha Meléndez collected some of her best critical studies in *Figuración de Puerto Rico y otros estudios*, and Ángel Flores compiled *Historia y antología del cuento y la novela en hispanoamérica.*

Autobiography and authors' personal compilations were also represented in 1959. *La flama*, the fifth volume of the memoirs of the Mexican essayist, José Vasconcelos, was published. Mariano Picón Salas of Venezuela was the author of a delightful autobiographical essay, *Regreso de tres mundos*, which touches on many of the experiences of his generation. The late Alfonso Reyes of Mexico issued the ninth volume of his complete works (*Obras completas*).

Several important books relative to Latin America were published in English in the United States during 1959. Harriet de Onís' translation of the Peruvian chronicles of Pedro de Cieza de León (1518–60), the Spanish soldier and historian, appeared under the title *The Incas.* Thomas Mabry Cranfill compiled an anthology of contemporary Mexican art, verse, and prose fiction in *The Muse in Mexico: A Mid-Century Miscellany.* Gonzalo Fernández de Oviedo y Valdés' *Natural History of the West Indies* was translated by Sterling A. Stoudemire.

LATTER-DAY SAINTS. See Church of Jesus Christ of Latter-day Saints.

LATVIA. Independent since 1918, Latvia was forcibly annexed to the USSR in 1940 and reannexed by force after World War II, thus becoming the Latvian Soviet Socialist Republic. The United States does not recognize this annexation.

Area and Population.—Latvia's area is about 25,000 square miles; its population (1959), 2,094,000, of which 56% is urban. The largest cities, with their 1959 populations, are Riga, the capital, 605,000; Liepaja (Libau), 71,000; Daugavpils (Dvinsk), 65,000; and Jelgava (Mitau), 31,700 (1956). The predominant religion is Lutheran, although there are many members of the Roman Catholic and Russian Orthodox churches. About 70% of the people are Latvians, an Indo-European ethnic group. Russians constitute the largest minority.

Government.—The Latvian legislature is a single-chamber Soviet of 200 deputies elected for 4-year terms. It rarely meets, and in the interim its authority is delegated to a Presidium and a Council of Ministers (cabinet). The present premier is Yan V. Peive. The Latvian government has no political autonomy, merely fulfilling orders from the Kremlin. All important posts are held by members of the Latvian Communist Party, which is headed by Arvid Y. Pelshe, the first secretary.

In 1959, Latvia had 61,414 members of the Communist Party, 120,000 members of the Young Communist League, and 640,000 trade unionists. Data in the Latvian press indicated that the majority of Latvian Communists were Russian civilians and troops residing in the country.

Finance.—The 1959 budget listed expenditures of 4,086,764,000 rubles ($1,021,691,000), an increase of 273,764,000 rubles ($68,441,000) over 1958.

Economy.—Latvian agriculture, with 1,220 collective farms, is largely collectivized. About 3,600,000 acres, of which one fifth was in state farms, were under cultivation in 1959. The main crops are grain, potatoes, hay, and flax. The Seven-Year Plan (1959–65) calls for a 500,000-acre increase in crop land, but the main emphasis of the agricultural plan is on livestock raising. The output of farm produce in 1965 is planned to increase over 1958 by the following percentages: grain, 100–120; potatoes, 70; sugar beets, 50–70; meat, 60; milk, 50–70; and butter, 80.

The Seven-Year Plan also calls for the expansion of the electrical equipment, radio-television, precision machinebuilding, railway carbuilding, and fishing industries. Industrial production in 1965 is planned to increase over 1958 by the following percentages: all industry, 60; machinery, 100; railway cars, 100; electric light bulbs, 80; and cement, 60. The fish catch is scheduled to increase by 120%. In addition, the plan provides for the construction of 1,760,000 square meters of government housing and the completion of the Dashava-Minsk-Vilnyus-Riga gas pipeline.

Principal Events, 1959.—The standard of living remained low in Latvia in 1959, and even the Latvian press admitted that there were shortages of vegetables in urban stores. This was one of the

sources of public discontent. President Yan E. Kalnberzins criticized this discontent in a major speech accusing the Latvian masses of bourgeois nationalism, chauvinism, bourgeois ideology, belief in capitalist propaganda, absenteeism from work, defective production, hooliganism, and excessive drinking. In July, Deputy Premier Eduards K. Berklavs was discharged for having advocated that emphasis under the Seven-Year Plan be placed on consumer goods rather than on heavy industry. To keep discontent under control, 100,000 Russian army and police troops were stationed on Latvian soil during the year.

ELLSWORTH RAYMOND,
USSR Area Specialist and Associate Professor of Government, New York University.

LAW. Supreme Court Statistics.—During the term which began in October 1958 and ended in June 1959, the Supreme Court of the United States handed down 113 opinions, of which 13 were *per curiam*. Sixty-one per cent of the opinions showed dissents, with 24 of these 69 being five-four decisions. Eighty-six cases (all but 27) involved either the government of the United States or of a state. Of the federal government cases, 11 involved criminal law, seven concerned federal regulation, six dealt with taxation, six with public contracts and property, five with labor, three with transportation, and one with aliens. Justice William J. Brennan, Jr., wrote 14 opinions, which was the most by any one justice, while Chief Justice Earl Warren tied with Justices Hugo L. Black, Charles Evans Whittaker, and Potter Stewart in writing 11 opinions, which was the least. The chief dissenter was Justice William O. Douglas, with 39 such votes, and the member of the court who dissented the least number of times (11) was Justice Tom C. Clark. The court disposed of 1,781 cases during the 1958–59 term, leaving 281 cases on the docket at the end of this term.

Business Regulation; Antitrust Laws.—In a case applying the antitrust laws to a federally regulated industry, the court held that prior approval by the Federal Communications Commission of an agreement for the exchange of television stations did not preclude a civil action by the United States under the Sherman Act. Relying primarily on the legislative history of the Communications Act, the court decided that the scope of the commission's approval was limited to the statutory standard of "public interest, convenience, and necessity" (*United States* v. *Radio Corporation of America,* 358 U.S. 334). In another Sherman Act case, *Melrose Distillers, Inc.* v. *United States* (359 U.S. 271), the court refused to allow the dismissal of an indictment for restraining trade and conspiring and attempting to monopolize commerce, when the corporate defendants were dissolved and became separate divisions of a new corporation under the same ultimate ownership. *International Boxing Club* v. *United States* (358 U.S. 242) was a civil action under the Sherman Act for restraint of trade in the promotion, broadcasting, and televising of world championship boxing contests. The court decided that championship boxing, as distinguished from boxing in general, was a sufficiently separate part of the trade or commerce to constitute the "relevant market" for purposes of the antitrust law.

In *Klor's, Inc.* v. *Broadway-Hale Stores, Inc.* (359 U.S. 207) the court held that a conspiracy among many manufacturers and distributors and one retailer not to sell to another retailer, or to sell to the latter only at discriminatory prices and unfavorable terms, violated the Sherman Act. The combination was found to interfere with the natural flow of interstate commerce and to have a "monopolistic tendency," even though the victim was just one merchant whose business was so small that his destruction would make little difference to the economy.

In a case of first impression under the Robinson-Patman Act, the court held that a dress pattern manufacturer was not justified in furnishing free services and facilities, of substantial value, to large variety stores, while not furnishing the same services and facilities to small fabric stores (*Federal Trade Commission* v. *Simplicity Pattern Co.,* 360 U.S. 55). The court found that "competition" existed, within the meaning of the law, even though the variety stores sold patterns for a profit while the smaller stores sold them as an inducement to customers to buy yard goods.

Safeway Stores, Inc. v. *Oklahoma Retail Grocers Ass'n.* (360 U.S. 334) involved the validity of the state's Unfair Sales Act as applied to the prohibition of sales of groceries at prices below cost. Holding that the statute, as so applied, did not violate the equal protection clause of the 14th Amendment, the court rejected the contention that there was a constitutional right to compete by selling below cost to meet competition from other grocers violating the law. It also decided that allowing grocers to give trading stamps with goods sold at or near the statutory minimum price was not unconstitutionally discriminatory, because such stamps were given to cash customers "across the board," whereas price cuts were made selectively in order to lure customers into the store with "loss leaders."

Interpreting the federal Bankruptcy Act, the court held that an employer's contributions owed to a union welfare fund (established under a collective bargaining contract) were not entitled to priority as meeting the statutory concept of "wages due to workmen" (*United States* v. *Embassy Restaurant, Inc.,* 359 U.S. 29).

In a case distinguishing between "insurance" and "securities," the court decided that issuers of "variable annuities" had to register them with the Securities and Exchange Commission (*Securities and Exchange Commission* v. *Variable Annuity Life Insurance Co.,* 359 U.S. 65). Since these "annuities" had no element of fixed return, but were dependent on the value of investments made by the insurer, it was held that they were not really "insurance" and that for this reason their issuance was subject to federal regulation.

Interpreting a provision of the Fur Products Labeling Act, the court held that a retail sales slip is an "invoice" within the meaning of language prohibiting falsely invoiced sales of furs (*Federal Trade Commission* v. *Mandel Bros., Inc.,* 359 U.S. 385). The argument that the "invoice" provision did not apply to retail sales was rejected, with emphasis on the fact that the invoice was the only permanent record of the transaction that the purchaser had. (See also FEDERAL TRADE COMMISSION; SECURITIES AND EXCHANGE COMMISSION.)

Communications; Transportation; Public Utilities.—Deciding that the Federal Communications Act prevented a broadcasting company from removing defamatory statements from speeches made by candidates for public office, the Supreme Court held that the act also granted to a radio or television station an immunity from liability for libelous material which it broadcast (*Farmers Educational Union* v. *WDAY, Inc.,* 360 U.S. 525). The court said that to allow civil, and perhaps criminal, liability to be imposed for the very conduct which the statute demands of the licensee would be "unconscionable."

T.I.M.E., Inc. v. *United States* (359 U.S. 464)

raised the question whether a shipper of goods by a certificated motor carrier could challenge, in postshipment litigation, the reasonableness of the carrier's charges which had been made in accordance with tariffs duly filed with the Interstate Commerce Commission. The court held that the Motor Carrier Act precluded the recovery of past charges alleged to have been unreasonable, rejecting the argument that denial of a remedy to the shipper who had paid such rates would be to sanction injustice.

A violation of the policy of free trade reflected in the commerce clause was determined to exist in an Illinois statute requiring the use of contour-type rear mudguards on trucks and trailers, rather than the customary straight mudguards (*Bibb* v. *Navajo Freight Lines, Inc.*, 359 U.S. 520). The court found this to be one of those rare cases where local safety measures that are nondiscriminatory place an unconstitutional burden on interstate commerce, since the state was insisting on a design which was out of line with the requirements of most other states. Acting to preclude a multitude of interpretations of the same federal certificate by several states, the court held that the Virginia courts could not impose a fine against a motor carrier certificated by the Interstate Commerce Commission to operate in interstate commerce, based on the belief by the state Corporation Commission that a routing of some of the carrier's business was merely a subterfuge to evade Virginia law (*Service Storage and Transfer Co., Inc.* v. *Virginia*, 359 U.S. 171).

In *Atlantic Refining Co.* v. *Public Service Commission* (360 U.S. 378) the Supreme Court upset a determination by the Federal Power Commission which allowed the sale of offshore gas by producers to a transmission company at a price agreed upon by these parties. The price was higher than the transmission company had ever paid, and the court held that the commission should have issued a conditional, instead of a permanent, certificate on the basis of the record before it.

Taxation.—In *Cammarano* v. *United States* (358 U.S. 498) the court upheld, as having acquired the force of law, a longstanding provision of U.S. Treasury regulations prohibiting the deduction of expenditures for "lobbying" or for the promotion or defeat of legislation. The amounts in question were spent to save the taxpayer's business from extinction by legislation, and would have been deductible as "ordinary and necessary business expenses," in computing federal income taxes, except for the regulations. The time when income should be reported by taxpayers using the "accrual" method of accounting was at issue in *Commissioner* v. *Hansen* (360 U.S. 446). The court held that amounts withheld by finance companies when they purchased installment paper from automobile dealers, in order to cover possible losses on such paper, were income to the dealers when recorded on the books of the finance companies as liabilities to the dealers. *Parsons* v. *Smith* (359 U.S. 215) involved the question of entitlement to the deduction for depletion, as between owners of coal lands and persons whom the latter paid to extract coal from their properties. The court held that the deduction was available only to a person having a capital investment in the mineral in place.

State taxing power was ruled on by the Supreme Court in several cases. That a state had power to tax the net income of a business engaged exclusively in interstate commerce was decided in *Northwestern States Portland Cement Co.* v. *Minnesota* (358 U.S. 450). The court qualified this holding by saying that the tax must be calculated on the basis of a fair apportionment formula, that it must be nondiscriminatory, and that there must be a sufficient "nexus" (that is, connection), in the form of business activity within the taxing state, to satisfy the requirements of the due process clause of the 14th Amendment. In *Youngstown Sheet and Tube Co.* v. *Bowers* (358 U.S. 534) the court upheld state personal property taxes on imported iron ore and lumber, as against the contention that the levies violated the import clause of the Constitution (Art. 1, sect. 8). The determining factor was that the goods had been committed to use in the manufacturing process and thus had lost their immunity from taxation. In *Railway Express Agency, Inc.* v. *Virginia* (358 U.S. 434) the validity of a franchise tax on a transportation company doing an exclusively interstate business was unsuccessfully challenged. The tax, which was measured by gross receipts, was determined to be a constitutionally permissible tax on "intangibles," or "going concern" value. The decision in *Allied Stores of Ohio, Inc.* v. *Bowers* (358 U.S. 522) was that a state could tax the warehoused property of a resident while exempting the property of nonresidents under similar circumstances, without violating the equal protection clause of the 14th Amendment.

Criminal Law.—In *United States* v. *Shirey* (359 U.S. 255) the Supreme Court held that an offer by a person to a congressman to contribute $1,000 a year to a political party, in consideration of the legislator's use of his influence to procure a postmastership for the defendant, violated a federal bribery law. In *Arroyo* v. *United States* (359 U.S. 419) the "anti-kickback" provision of the Taft-Hartley Act was termed inapplicable to the theft by a union official of an employer's contribution to an employees' welfare fund. The court found in the legislative history of the act no congressional intent to duplicate state criminal laws. In *Heflin* v. *United States* (358 U.S. 415) the court refused to allow the same defendant to be convicted under the federal Bank Robbery Act both for feloniously taking and for feloniously receiving the same property.

The fact that kidnaping and murder are separate crimes in Oklahoma posed the question whether a judge, in sentencing for kidnaping, could consider murder during the kidnaping, for which the defendant had already been convicted (*Williams* v. *Oklahoma*, 358 U.S. 576). The court answered the question in the affirmative. In *Abbate* v. *United States* (359 U.S. 187) the defendants had previously been convicted, under an Illinois statute, of destroying telephone facilities. The court held that this fact did not bar their prosecution for the same acts under a federal law making it a crime to destroy means of communication controlled or operated by the United States, rejecting the plea of "double jeopardy" under the 5th amendment. The reverse situation was considered in *Bartkus* v. *Illinois* (359 U.S. 121) where the court decided that the defendant could be tried under a state robbery statute, even though he had previously been acquitted when tried (on the basis of the same facts) under a federal statute. The court thought that "precedent, experience, and reason all support the conclusion" that there was no deprivation of due process contrary to the 14th Amendment.

The previously affirmed right to have judicial review of a criminal conviction without paying a fee for filing an appeal was extended to include all phases of the review procedure, in *Burns* v. *Ohio* (360 U.S. 252). Accordingly, an indigent defendant, who had already been afforded a review by the intermediate Ohio Court of Appeals, was

held to have a right, under the due process clause of the 14th Amendment, to invoke the discretionary reviewing authority of the state Supreme Court without paying docket and filing fees. A conviction for first-degree murder was reversed on the ground that the defendant's confession was involuntary, in *Spano* v. *New York* (360 U.S. 315). The accused was questioned for about eight hours, was refused permission to speak with his attorney, and was partly induced to confess by a policeman friend who falsely stated to him during the questioning that his job was endangered by a telephone call which the defendant had made to him. *Cash* v. *Culver* (358 U.S. 633) involved the right to counsel under the 14th Amendment's guarantee of due process of law. An uneducated farm boy's unfamiliarity with his rights under Florida law to demand a cautionary instruction to the jury with respect to the evidence of an accomplice operated to make the denial of counsel a deprivation of due process, the court found. The right to the assistance of counsel was also litigated in *Anonymous* v. *Baker* (360 U.S. 287), where a state judge was conducting a judicial inquiry into alleged improper practices of lawyers. The court held that the judge could require counsel for subpoenaed witnesses to remain outside the hearing room, where he offered to suspend the proceedings whenever the witnesses wanted to consult with counsel. Convictions of contempt for the witnesses' refusals to answer questions were upheld, and the contention that the due process clause of the 14th Amendment was violated by this procedure was rejected.

In *Frank* v. *Maryland* (359 U.S. 360) the court upheld a city ordinance permitting health inspection of premises without a warrant and providing a fine for refusal of entry for such inspection. Contentions that the ordinance was unconstitutional under the "unreasonable search and seizure" and the "due process" provisions of the Constitution were rejected. "Probable cause" to believe that a person arrested without a warrant had committed a crime was the issue before the court in *Draper* v. *United States* (358 U.S. 307). The arrest by a federal narcotic agent of a person fitting the description given by a reliable informant, under circumstances accurately predicted by the informant, was upheld as lawful under the 4th Amendment, and the subsequent search of the defendant's person and seizure of drugs from him were found to be valid.

Communism and Internal Security.—In *Raley* v. *Ohio* (360 U.S. 423) the Supreme Court held that witnesses before a state's Un-American Activities Commission could not be convicted of contempt, on the theory that they were presumed to know the law of the state, for refusal to answer certain questions when a state immunity statute deprived them of the protection of the privilege against self-incrimination. The defendants had claimed the privilege in refusing to answer each of the questions. The court reversed three out of four convictions under these circumstances, asserting that they violated the due process clause of the 14th Amendment and were the result of "an indefensible sort of entrapment by the State."

In two companion cases, the court denied the power of the secretary of defense to revoke the security clearances of employees of government contractors. Without explicit authorization from either the president or Congress, government officials could not deprive such employees of their jobs in proceedings where they were not afforded the safeguards of confrontation and cross-examination, the court ruled in *Greene* v. *McElroy* (360 U.S. 474). Substantially the same facts were involved in *Taylor* v. *McElroy* (360 U.S. 709). In *Vitarelli* v. *Seaton* (359 U.S. 535) the court upset the dismissal of a government employee on grounds of national security, where the discharge proceedings fell substantially short of the requirements of the applicable departmental regulations.

Rejecting the argument that Congress, by enacting the Smith Act, had completely occupied the field of subversive activities, the court upheld the application of the New Hampshire Subversive Activities Act to compel the production of the names of guests at an alleged Communist-front camp (*Uphaus* v. *Wyman,* 360 U.S. 72). The court affirmed the state's power to investigate, in the interest of self-preservation, as to whether subversive persons were present in the state. In *Barenblatt* v. *United States* (360 U.S. 109) the court affirmed the conviction for contempt of Congress of a witness refusing to answer questions inquiring whether he was or ever had been a member of the Communist Party. It was decided that the inquiry of a subcommittee of the House Committee on Un-American Activities did not violate the 1st Amendment, since it was part of an appropriate investigation of the advocacy of, or preparation for, the ultimate overthrow of the government of the United States by force and violence. The court concluded that "the balance between the individual and the governmental interests here at stake must be struck in favor of the latter. . . ." (See also CIVIL LIBERTIES.)

Racial Discrimination.—The Supreme Court reversed a state court's conviction of a person refusing to answer questions of a Virginia legislative committee investigating integration in the public schools and related subjects, on the ground that the witness had not been clearly advised as to the purposes of the inquiry (*Scull* v. *Virginia,* 359 U.S. 344). Although not reaching the question of possible invasion of "an area of speech, press, and association of vital public importance," the court remarked that the circumstances surrounding the subpoena, as well as the questions asked, made it clear that the investigation touched such an area.

In *Lassiter* v. *Northampton County Board of Elections* (360 U.S. 45) the court upheld a requirement that a prospective voter "be able to read and write any section of the Constitution of North Carolina in the English language." It refused to draw the inference that the literacy provision was merely a device to make racial discrimination easy, finding that this test fell within the wide scope for permissible exercise of a state's power to prescribe standards for voters.

The court decided that Virginia courts should be allowed a reasonable chance to construe certain state statutes concerning rendering of financial aid in litigation and activities and advocacy relating to racial integration or segregation, before the federal courts would be permitted to enjoin the enforcement of such statutes (*Harrison* v. *NAACP,* 360 U.S. 167). Without intimating any view as to the validity of the state statutes, the court merely held that these enactments should be exposed to state court construction or limiting interpretation before the federal courts were asked to decide upon their constitutionality.

Censorship.—The court struck down as unconstitutional under the 1st and 14th Amendments a New York State motion picture censorship provision, when applied to *Lady Chatterley's Lover* (*Kingsley International Pictures Corp.* v. *Regents,* 360 U.S. 684). The invalidated statute prohibited the exhibition of films presenting acts of sexual immorality (in this case, adultery) as desirable, acceptable, or proper patterns of behavior. The court said that the state had "struck at the very heart of constitutionally protected liberty" in at-

tempting to prevent the advocacy of an idea—that adultery under certain circumstances may be proper behavior.

In *Smith* v. *California* (361 U.S. 147), the court held that an ordinance making the mere possession of an obscene book by a bookseller a crime was unconstitutional as invading freedom of speech and of the press, under the 14th Amendment. The imposition by the state of "strict liability," making possible a conviction of a person having no knowledge whatsoever of the contents of a book, was considered by the court to have "such a tendency to inhibit constitutionally protected expression that it cannot stand under the Constitution."

Torts; Workmen's Compensation.—Several cases involving admiralty law were decided by the Supreme Court. In a case of first impression, the court held that maritime law applied to an accident on a ship berthed in New York, and that the shipowner owed a duty of reasonable care to the social guest of a crew member (*Kermarec* v. *Compagnie Generale Transatlantique*, 358 U.S. 625). In *United, etc., Pilots Ass'n* v. *Halecki* (358 U.S. 613) the court denied damages for the death of a shore-based electrician under the doctrine of "unseaworthiness" (under which a shipowner can be held liable even if he exercises reasonable care). The reason for the decision was that, in using special equipment to clean generators, the injured employee was not doing the type of work traditionally performed by ship's crew. On the other hand, a stevedore was allowed to recover damages for injury due to "unseaworthiness," in *Crumady* v. *The Joachim Hendrik Fisser* (358 U.S. 423). In *The M/V "Tungus"* v. *Skovgaard* (358 U.S. 588) the widow of an employee of an independent contractor hired to discharge cargo was allowed to recover damages under the New Jersey wrongful death statute, where the death occurred in navigable waters within the territory of New Jersey.

The three-year statute of limitations did not apply to a suit under the Federal Employers' Liability Act, where the employer had induced the delay by telling the employee he had seven years in which to sue, the court decided in *Glus* v. *Brooklyn Eastern District Terminal* (359 U.S. 231), citing in support of its holding the maxim that "no man may take advantage of his own wrong."

Governmental immunity from suit was involved in *Petty* v. *Tennessee-Missouri Bridge Commission* (359 U.S. 275), where the widow of an employee who died in a ferryboat accident was allowed to collect damages from a state-created commission. The court said that the two states had waived their immunity by the terms of a compact prepared by them and submitted to Congress.

In two similar cases the court refused to allow the recovery of damages for defamatory material published by government officials. A letter from the commanding officer of a naval shipyard to certain members of Congress was held to be "absolutely privileged," so that a person claiming to be defamed thereby could not maintain a lawsuit even if the officer acted maliciously (*Howard* v. *Lyons*, 360 U.S. 593). It was found that the circulation of the report was clearly done in the discharge of the officer's duties. In *Barr* v. *Mateo* (360 U.S. 564) the same doctrine of "absolute privilege" was applied to a press release in which the director of a government agency announced his intention to suspend certain employees for conduct for which the agency had been criticized. The court stressed the importance of government officials' being "free to exercise their duties unembarrassed by the fear of damage suits in respect of acts done in the course of those duties."

Labor Law.—The jurisdiction of state courts, a familar cause of controvery, was litigated in several cases. In *San Diego Building Trades Council* v. *Garmon* (359 U.S. 236) the Supreme Court held that a state court had no power to award damages for injuries caused by peaceful picketing, on the ground that picketing was a tort under state law, even though the National Labor Relations Board had declined to exercise its jurisdiction in the case. The court distinguished cases involving intimidation and threats of violence, where action by state courts is permissible. In *Plumbers Local* v. *County of Door* (359 U.S. 354) it was decided that a state court could not enjoin the peaceful picketing of a county courthouse, in spite of the fact that the complainant was the affected county. The court rejected the arguments that the labor dispute did not affect interstate commerce and that political subdivisions were not subject to the National Labor Relations Act. A conflict between state and federal law was settled in favor of the latter in *Teamsters* v. *Oliver* (358 U.S. 283), where the court held that an Ohio antitrust law could not be applied to restrain the carrying out of an agreement relating to the rental of trucks by owner-drivers to a lessee-operating company. The basis of the decision was the court's view that the rental provisions were intimately related to the problem of maintaining the basic wage structure established by collective bargaining, and therefore came within the scope of the National Labor Relations Act.

In *United Steel Workers* v. *United States* (361 U.S. 39) the Supreme Court upheld the injunction granted by the lower courts to send striking steelworkers back to their jobs for an 80-day cooling-off period. Rejecting the union's arguments that neither the national health nor the nation's safety were being imperiled, the court said that there was ample ground for holding (under the Taft-Hartley Act) that the national safety was affected. It did not decide whether the national health was endangered.

In *National Labor Relations Board* v. *Cabot Carbon Co.* (360 U.S. 203) the court decided that "employee committees," established and supported by employers at each of their several plants to consider and discuss problems of mutual interest, including grievances, were "labor organizations" within the meaning of the National Labor Relations Act, even though they did not "bargain with" employers in the usual concept of collective bargaining. For this reason, it was determined that the act prohibited employers from dominating, interfering with, or supporting such committees.

In *National Labor Relations Board* v. *Fant Milling Co.* (360 U.S. 301) an unfair labor practice complaint formulated by the NLRB was predicated partially on events occurring after the filing of charges by a union with the Board's regional director. The court held that these subsequent events, relating to the refusal of an employer to bargain in good faith, could properly be considered by the board where such events were related to and grew out of those alleged in the charges. In applying the Fair Labor Standards Act, a personal loan company is not exempt as a "retail or service establishment," the court ruled in *Mitchell* v. *Kentucky Finance Co.* (359 U.S. 290). The opinion stressed the legislative history of the act, as well as the rule that exemptions from it must be narrowly construed. *Mitchell* v. *Lublin, McGaughy & Associates* (358 U.S. 207) involved the question of whether draftsmen and other employees of an architectural and consulting engineering firm were "engaged in commerce," so as to be subject to the minimum wages and maximum hours provisions of the same act. Answering the question in the affirmative, the court relied on the fact that the employees worked intimately with plans and specifications prepared by the company for the repair and construction of various interstate instrumentalities and facilities. (See also NATIONAL LABOR RELATIONS BOARD.)

Interpreting provisions of the Railway Labor Act, the court held that retired employees must submit their backwages claims to the National Railroad Adjustment Board, and could not bypass the board and sue in a federal district court (*Pennsylvania R.R. Co.* v. *Day*, 360 U.S. 548). The uniform administrative interpretation of the board itself in adjudicating claims of retired employees was considered to be of great importance in reaching this result. In another case under this act, the court held that an employee's submission to the board of his grievances as to the validity of his discharge precluded him from seeking damages in a common-law action three years later (*Union Pacific R.R. Co.* v. *Price*, 360 U.S. 601). The court cited a provision of the act that awards of the board are final and binding except insofar as they contain a money award, and said that the denial of a claim for money damages was not a "money award." Under a proviso in the act that the "checkoff" of dues to a union could be revoked in writing by an employee after the expiration of one year, it was held that a railroad and a union could not require an employee to execute a form furnished by the union and forwarded by it to the employer, as a prerequisite to the employee's release from the authorization to deduct dues from his wages (*Felter* v. *Southern Pacific Co.*, 359 U.S. 326).

RICHARD L. HIRSHBERG,
Attorney at Law.

LEAD. Smelter production of lead in the world and the United States in 1953–58 is shown in the accompanying table, compiled from U.S. Bureau of Mines data. (Production figures are in thousands of metric tons.)

Year	World	U.S.	% in U.S.	Year	World	U.S.	% in U.S.
1953	1,860	424.3	22.8	1956	2,180*	491.9	22.9
1954	1,990	441.5	22.2	1957	2,280*	483.8	21.4
1955	2,010	434.5	21.6	1958	2,250	425.0	19.0

* Revised.

United States.—In 1958, supply of lead exceeded demand by a wide margin, resulting in rapid stock buildups and lower metal prices. Imports were in almost unprecedented quantity. Domestic mine production fell sharply (whereas world output declined only 3%). The United States is the world's leading producer of both mined and smelter lead. Missouri continued to rank first, as it has for 52 years; Idaho ranked second, and Utah third. These three states produced nearly 78% of the domestic output of lead in 1958 (72% in 1957).

Domestic lead mined in 1958 totaled 267,377 short tons, compared with 338,216 tons in 1957. Refined lead totaled 470,176 tons in 1958, compared with 533,533 tons in 1957. Lead refined from foreign ores totaled 201,074 tons in 1958, compared with 185,858 tons in 1957. The quantity refined from domestic ores was 269,082 tons in 1958, compared with 347,675 tons in 1957. Consumption was down 13% from the 1957 level, to 986,387 tons from 1,138,156 tons.

In the first nine months of 1959, production of recoverable lead totaled 189,952 short tons, a decline from 199,925 tons in the first nine months of 1958.

United Nations Program.—The U.S. Bureau of Mines reported that: "Concerned over the apparently chronic world oversupply of lead, the United Nations, through the U.N. Interim Coordinating Committee on International Commodity Agreements, held talks in London in September 1958 designed to explore areas of possible agreement among interested nations to effect stabilization of world lead-zinc supply." A lead-zinc committee was formed.

(See also MINERAL PRODUCTION.)

F. E. HARRIS, *Former Publications Editor, "Mineral Trade Notes,"* and BERENICE B. MITCHELL, *Commodity Industrial Analyst, Division of Foreign Activities, U.S. Bureau of Mines.*

LEAHY, William Daniel (84), American naval officer and diplomat: b. Hampton, Iowa, May 6, 1875; d. Bethesda, Md., July 20, 1959. Graduated from the U.S. Naval Academy in 1897, he was a midshipman aboard the *Oregon* when it made its dramatic run around Cape Horn from the Pacific to join in the Battle of Santiago (July 3, 1898). He also saw service in the Philippine Insurrection and the Boxer uprising in China in 1900, the Nicaraguan occupation in 1912, and the Haitian campaign in 1916. While he was in command of the dispatch boat *Dolphin,* he became a close friend of Franklin D. Roosevelt, then assistant secretary of the Navy, whom he was to serve in various capacities when Roosevelt became president. Between World Wars I and II, Leahy was successively chief of the Bureau of Ordnance (1927–31), of the Bureau of Navigation (1933–35), and of naval operations (1937–39) with the rank of admiral.

On his retirement in 1939, Leahy was appointed governor of Puerto Rico and then United States ambassador (1940–42) to the French government at Vichy. He won Marshal Pétain's confidence while there and may have stiffened Pétain's resistance to German demands. In 1942 he was named personal chief of staff to President Franklin D. Roosevelt in the latter's capacity as commander in chief of the armed forces. Leahy accompanied the president to many international meetings, including the controversial Yalta Conference. In December 1944 he was one of the first three officers to be promoted to the new five-star rank of admiral of the fleet. He was retained as chief of staff by President Harry S Truman, and continued in that position until his retirement in 1949, meanwhile participating in the reorganization of the armed services. In the following year he published *I Was There,* an account of his years in Washington.

LEATHER. Total output of leather in the United States in 1959 was moderately higher than production in 1958. Sharpest year-to-year gains in volume were in leathers made from goat and kid skins and sheep and lamb skins. Calfskin leather production suffered a decline, resulting primarily from a scarcity of raw calfskins.

Market prices for bovine hides and skins advanced sharply during the early part of 1959. Smaller domestic slaughter, a continuation of the trend which started late in 1957, together with export demand for raw material, combined to force market prices upward by 100% to 250% over price levels prevailing in 1958. By late fall, market prices had declined substantially and trading was conducted at levels 15% to 25% higher than a year earlier.

Shoe production in the United States, which annually consumes approximately 80% of the American leather industry's output, was at a record level in 1959 (see SHOE INDUSTRY).

U.S. PRODUCTION OF LEATHER

Raw material	Unit	1959 (9 months)	1958 (Full year)
Cattle	hides	15,781,000	23,818,000
Calf and whole kip	skins	4,601,000	8,069,000
Goat and kid	skins	15,374,000	19,992,000
Sheep and lamb	skins	21,018,000	27,453,000
Cabretta	skins	2,155,000	3,286,000

Figures on production of major types of leather, by reference to the raw material used, are shown in the accompanying table. The five categories listed account for approximately 97% of total output, with smaller quantities being made from hides or skins of the horse, deer, elk, pig, alligator, buffalo, ostrich, and various reptiles.

LEIF C. KRONEN,
Secretary, Tanners' Council of America, Inc.

LEBANON. An Arab republic on the eastern shore of the Mediterranean Sea, Lebanon is bounded on the north and east by the Syrian Region of the United Arab Republic (UAR) and on the south by Israel. It has an area of 4,015 square miles and a population (mid-1957 est.) of 1,525,000, excluding Palestine refugees (129,228 registered as of December 1958). The capital, Beirut

(est. pop., 500,000) has modern port facilities, an extensive free zone for transit trade, and a large international airport. Other important cities are Tripoli (100,000), Zahle (33,000), and Saida (ancient Sidon, 22,000). The official language is Arabic, but French is widely spoken.

Government.—The executive department consists of a president (Fouad Chehab, inaugurated Sept. 23, 1958), who is selected by the legislature for a 6-year term, and a cabinet headed by a prime minister. The cabinet, numbering eight members following its reorganization on Oct. 8, 1959, is appointed and may be removed by the president, but is also responsible to the legislature. There is a unicameral Chamber of Deputies of 66 members, who are elected for normal terms of four years. (The last general elections were held in June 1957.) Voting is compulsory for every Lebanese citizen 21 years of age or older, and the electoral law apportions seats in the Chamber of Deputies on a religious basis. By constitutional convention, the president is a Maronite Christian, the prime minister a Sunni Moslem, and the speaker of the Chamber of Deputies a Shi'ite Moslem. Lebanon is a member of the Arab League and the United Nations.

Finance.—The unit of currency is the Lebanese pound (£L), with a free market value on Aug. 31, 1959, of 31.75 cents (U.S.). The official rate, used chiefly in computing certain government trade statistics, is 45.63 cents. The monetary supply on April 30, 1959, was £L1.02 billion, with £L399 million in currency and £L621 million in demand deposits in commercial banks. There is no central bank; the currency is managed by the French-controlled Bank of Syria and Lebanon.

Revised budget figures for 1958 showed expenditures of £L205 million (compared with an anticipated £L194.2 million) and ordinary revenues of £L180.5 million. The deficit was more than made up by United States grants of £L39.5 million ($12.5 million), which provided a carryover of £L15 million into 1959. The budget estimates for 1959 were balanced, with expected expenditures amounting to £L205 million. Defense allocations totaled £L43.9 million; education, £L30.9 million; and public works, £L28.1 million. Lebanon has no national debt except for a $27 million World Bank loan for economic development, which is still largely unused.

Defense.—The Lebanese army numbers about 9,000 men. There are also a gendarmerie of 2,500, a police force of 500, and a special security force of 250. The small air force has a personnel of some 350 men, and the naval arm, composed of three coastal patrol boats, has a strength of about 100.

Education.—Public education comprises a compulsory five-year program of primary instruction, followed by either a four-year intermediate program (leading possibly to further vocational or technical training) or a seven-year secondary program preparatory to professional or university studies. In 1956 there were 1,107 public schools and 1,166 private and foreign schools, enrolling 188,338 students. Institutions of higher learning are concentrated in Beirut, and include the Lebanese University (governmental, with 374 students in 1958), St. Joseph University (Jesuit, with 1,649 students), and the American University of Beirut (2,177 students).

Religion.—Government estimates indicate that a majority of the people are Christians, belonging mainly to the Maronite (424,000), Greek Orthodox (150,000), Greek and Roman Catholic (91,000), Armenian Orthodox (69,000), and Armenian Catholic (14,500) sects. There are about 14,000 Protestants. Of the Moslems, both the Sunnite (286,000) and Shi'ite (250,000) sects are represented. There are also about 88,000 Druses and 6,600 Jews. There is no state religion.

Transportation and Communications.—There are about 2,225 miles of improved roads in Lebanon, and most passenger and commercial traffic moves by highway. At the end of 1957 there were 31,072 passenger cars, 5,339 commercial vehicles, and 1,481 buses in use. Operative railways, partially standard-gauge and partially narrow-gauge, link Beirut with Tripoli along the coast and connect both these cities, via the Syrian rail system, with Turkey and Europe. The direct Beirut-Damascus narrow-gauge line carries only freight traffic. Beirut International Airport is used by three national airlines and by many foreign air services.

The Iraq Petroleum Company operates two oil pipelines from Kirkuk, in Iraq, to Tripoli; the Trans-Arabian Pipe Line Company, a subsidiary of the Arabian American Oil Company, operates a pipeline from Dhahran in Saudi Arabia to Saida.

A television broadcasting station, which is both the first in Lebanon and the first commercial station in the Middle East, began regularly scheduled broadcasts in 1959. By July, over 1,500 television receivers had been installed in the country. There were 40,238 telephones in use on Jan. 1, 1958.

Economic Development.—The year 1959 saw an upturn in economic development activities in Lebanon. The government let additional contracts for the first phase of the Litani River development project, which is expected to provide irrigation for some 8,500 acres of farm land and to double the output of the country's electric power.

On May 10 the Soviet ambassador offered Russian economic aid to Lebanon for carrying out its development program. The minister of public works, Pierre Gemayel, replied that unconditional Soviet aid would be accepted if the need arose. Lebanon, however, continued to look to the West for economic assistance. On July 16 the U.S. Development Loan Fund approved a $500,000 credit to the Societé d'Electricité d'El Bared, a private utility company, for the rebuilding of its power plant. On July 23 the same agency agreed to lend $5 million to the Banque de Credit Agricole, Industriel, et Foncier (a Lebanese bank in which the government has 40% participation) for reloan to private entrepreneurs.

Agriculture and Industry.—Agriculture, which accounted for about one sixth of the national income of £L1.58 billion in 1957, is the principal occupation of over half of the working population. Important crops are citrus fruit (131,000 metric tons in 1958), wheat (48,000 metric tons), barley, potatoes, olives, and cotton. Also grown are tobacco, onions, tomatoes, apples, grapes, bananas, and watermelons. Goats (425,000 head in 1958), cattle (88,000 head), and sheep (70,000 head) are raised.

Manufactures include petroleum products (1,017,000 metric tons in 1957), cement (561,000 metric tons), electrical energy, soap, foodstuffs, cotton and woolen textiles, clothing, furniture, metal products, tobacco products, leather goods, and beet sugar. In 1957 there were 2,997 industrial establishments, offering employment to 37,088 workers.

Foreign Trade.—Exports in 1958 were £L101 million (compared with £L133 million in 1957); imports were £L698 million (£L800 million in 1957).[1] (In spite of apparently large trade deficits, Lebanon normally enjoys a favorable balance of international payments because of remittances from emigrants, income from tourism, and payments for services to the transit trade.) Transit traffic declined from 587,000 tons in 1957 to 329,000 tons in 1958, largely as a result of the UAR's closing of the Lebanese-Syrian frontier during the political crisis in the summer of 1958.

Major articles of export are fruits, vegetables, wool, cotton, cement, beer, petroleum products, cut diamonds, and gold. Major imports are cereals and flour, animals for slaughter, sugar, automobiles, engines and machinery, iron and steel, textiles, wood and paper, crude petroleum, uncut diamonds, and gold. Imports in 1958 came chiefly from Great Britain, the United States, the Syrian Region of the UAR (mostly in the period from January to April 1958), France, West Germany, Italy, Saudi Arabia, and Iraq. The principal customers were the Syrian Region of the UAR, Saudi Arabia, Jordan, West Germany, the United States, Iraq, and Great Britain. Of the exports, 45% went to nearby Arab countries; only 7.5% went to countries of the Soviet bloc.

Principal Events, 1959.—The cabinet of Prime Minister Rashid Karami ruled during the early months of 1959 under emergency decree powers granted by Parliament in November 1958. The Chamber of Deputies did not meet until June 13, when it assembled to review the policies and activ-

[1] The official import figure of £L486 million has been adjusted to the free-market rates of exchange in order to present a more meaningful comparison with the export figure. These statistics do not take into account either gold transactions or the transit trade through the free zone in Beirut.

ities of the administration. On October 8 the four-member cabinet of the emergency period was reorganized and expanded into an eight-member body.

The country was generally quiet in contrast to the virtual civil war of the preceding year. Some evidences of continued unrest, however, appeared from time to time. On February 22, during a celebration in Beirut of the first anniversary of the union of Syria and Egypt, Pan-Arabist supporters of President Nasser rioted, wrecking streetcars. Five days later two persons died and ten were wounded in renewed clashes in the capital between pro-Nasser Moslem Lebanese and Christian adherents of ex-President Camille Chamoun. On the evening of July 27, Naim Moghabghab, a member of Parliament and a close friend of Chamoun's, was beaten to death by a mob in a Druse area near Beirut. On September 25, following the execution in Iraq of 17 persons accused of plotting against the government of Premier Kassem, anti-Kassem riots broke out in Beirut, Tripoli, and Saida. Despite such disturbances, a former prime minister, Sami es-Solh, found it possible to return to Lebanon on July 4 from self-imposed exile in France after receiving assurances that he would be unmolested and might resume his seat in the Chamber of Deputies.

In foreign affairs the Lebanese government attempted to avoid involvement in the East-West struggle, but its ties with the West remained considerably stronger than its ties with the East. In May the government clamped firmer restrictions on Communist activities and deported a number of non-Lebanese Arab Communists. Efforts were made to re-establish friendly contacts with the other Arab states and to escape entanglement in the conflict between the Kassem regime in Iraq and that of President Nasser of the UAR. Good relations with the UAR, which had deteriorated during the crisis of 1958, were gradually restored after the Karami government came to power in October 1958. On Feb. 16, 1959, following a conference in Damascus, the UAR, Lebanon, Jordan, and Saudi Arabia reached a general agreement on the freedom of transit traffic. On March 25, President Chehab and President Nasser met in a specially-constructed hut athwart the Syrian-Lebanese frontier for a discussion of mutual problems. At Cairo on June 7, Premier Karami signed a Lebanese-UAR economic pact reaffirming the trade agreement of March 5, 1953, and fixing visa, customs, and export charges.

On January 14, Lebanon recognized the provisional government established by the Algerian nationalists, being the last of the Arab states to do so. In spite of this step, relations with France remained relatively good, and a new financial agreement between the two countries was signed on June 25 in Beirut to replace the outmoded convention of 1948.

Trouble with Israel flared on May 27 when the Israeli Air Force required a Lebanese Air Force plane to land at Haifa. The plane, which allegedly had been seeking to photograph Israeli positions south of the frontier, was returned to Lebanon on June 9. From July 28 to August 18, Lebanon was the site of conferences of the Arab League (q.v.) to discuss the economic boycott of Israel and the problems of the Palestine refugees. At these conferences and at the meeting of the Arab League Council in Casablanca in September, Lebanon supported the general Arab position on the Palestine question. On September 28, Premier Karami told the U.N. General Assembly that his government firmly supported the exclusion of Israeli ships and cargoes from the Suez Canal.

The long-standing disagreement between Lebanon and the internationally controlled Iraq Petroleum Company over transit royalties on oil moving through company pipelines within Lebanon was settled on June 3, 1959, when the oil company agreed to royalties of 46 cents per ton. The new rate will provide yearly royalties of about $3.5 million on the current annual throughput of 7.5 million tons of crude petroleum (compared with about $1 million at the old rate). Payment of some $16 million to cover prior Lebanese claims dating back to 1952 was also agreed to. Twenty per cent of the petroleum products processed at the Tripoli refinery of the company are to be made available to Lebanese distributors designated by the government.

LEGISLATION. See UNITED STATES—*The United States in 1959;* articles on the states and countries; and the Index entry, *Congress, U.S.*

LEMNITZER, Lyman Louis, U.S. Army officer: b. Honesdale, Pa., Aug. 29, 1899. Appointed vice chief of staff of the Army in 1957, Lemnitzer succeeded to the post of Army chief of staff on July 1, 1959, with the retirement of Gen. Maxwell D. Taylor.

A graduate of the U.S. Military Academy (1920), and later of the Command and General Staff School and of the Army War College, Lemnitzer established himself as a skilled negotiator during and after World War II. He began the war as a combat artillery officer in England. Made assistant chief of staff (G-3) to Dwight Eisenhower, commanding general of the European Theater of Operations, he planned the air-sea-land invasion of North Africa, and accompanied Gen. Mark Clark on a clandestine visit by submarine to North Africa before the invasion to persuade the French not to oppose the landings. In 1945 he took part in the discussions with the German high command in Switzerland that led to the German surrender in Italy and southern Austria. He was a persuasive exponent of the Mutual Defense Assistance Act before Congress in 1949, after having studied western European defenses in the previous year. Prior to his appointment as vice chief of staff, he commanded the United States and United Nations forces in the Far East during the cease-fire negotiations in 1955–57.

LIBERIA. A small republic on the west coast of Africa, bounded by Sierra Leone, Guinea, and Ivory Coast, Liberia has an area of about 43,000 square miles, and a population (est. July 1, 1956) of 1,250,000. Founded by freed American slaves in 1822, Liberia has maintained close ties with the United States. The descendants of the original American settlers constitute the most influential group and live mainly along the coast. The great bulk of the population are indigenous Africans; about 28 different tribal dialects are spoken. Non-Africans (only Africans may acquire citizenship) number about 3,500. Monrovia is the capital and chief city (est. pop., 50,000, including environs). English is the official language and the U.S. dollar is the legal tender.

Government.—Authority is centralized in the national government, organized into three branches: executive, legislative, and judicial. The president and vice president serve 8-year initial terms, and may be re-elected thereafter for 4-year terms. President William V. S. Tubman was re-elected in May 1959 for his fourth consecutive term. The True Whig Party of President Tubman controls all the seats of the elected bicameral legislature (a 35-member House of Representatives, to be increased to 39 in 1960, elected for 4 years; and a 10-member Senate, elected for 6 years). Opposition parties are not legally barred, but in practice there is no effective political opposition.

Education.—Illiteracy is high, and probably less than 15% of school age children attend school. As of 1958 there were 2,157 teachers in 690 schools attended by 53,242 students. About 62% of the students attended government schools; 27%, Christian mission schools; and 11%, private schools (chiefly company-operated). Institutions of higher education are the University of Liberia (300 students), Cuttington College (120 students), and Our Lady of Fatima College (40 students). The Booker T. Washington Institute is a trade and vocational institution with 460 students. In 1958, 447 Liberian students were abroad on scholarships.

Finance.—In 1958 government expenditures totaled $23.1 million (up $3.5 million from 1957), while receipts amounted to $18.1 million (down $2 million from 1957). Major sources of revenues were custom receipts (24%), company income taxes (23%), iron ore royalty payments (18%), and ship registration fees (9%). Another net budget deficit was anticipated in 1959, with increases in both revenues and expenditures. Extraordinary capital works expenditures are usually financed outside of the regular budget by means of foreign loans or credits, most of which have been received from the United States. As of Sept. 30, 1958, the public debt stood at $23.2 million.

Transportation and Communications.—A national highway expansion program is being pushed aggressively. There were some 2,000 miles of roads in 1959, of which about 700 miles were all-weather. At present the only railroad is the 42-mile Liberia Mining Co. line (freight only) running from the Bomi Hills iron ore deposits to Monrovia. Robertsfield, about 50 miles from Monrovia, is the chief airport, with service by several international lines, including Pan American World Airways. Partly because of its low registration fees, Liberia has achieved great popularity as a country of registration for foreign-owned vessels. As of June 30, 1959, Liberia was the leading flag of registry for the world's oil tanker fleet and ranked third in total shipping tonnage. The free port of Monrovia handled over 2.3 million tons of cargo in 1957. Liberia has a daily newspaper and 2 radio broadcasting stations.

Production.—Liberia's economy is chiefly agricultural, although mining is increasing in importance. The two principal subsistence crops are rice (annual production estimated at over 100,000 long tons, milled equivalent) and cassava (360,000 long tons). Liberia's 1959 output of rubber, the chief export crop, is expected to at least equal the 1958 total of 95.43 million pounds (dry rubber content). About 88% of the crop is produced by the Firestone Plantations Co., which employs about 25,000 Liberians; the remaining 12% is produced on an estimated 1,000 Liberian-owned farms. Total rubber acreage is 172,000, of which 63,000 acres are in immature trees. The B. F. Goodrich Co., which received a rubber concession in 1954, is expected to complete its initial planting of 10,000 acres by the end of 1959. Other export crops, produced by Liberian small-farm holders, include cocoa, coffee, and palm products. Iron ore is mined at Bomi Hills, where the Liberia Mining Co. (an affiliate of Republic Steel) produced 2,263,850 long tons in 1958 (2,128,650 in 1957). Rich new deposits, under development in the Nimba Mountains on the Guinea border (Liberian-American-Swedish Minerals Co.) and in the border area of Sierra Leone near the Mano River (National Iron Ore Co.), will greatly increase Liberia's importance as an iron-ore producing country. Lumber output expanded to nearly 9 million board feet in 1958, from about 5 million in 1957.

Foreign Trade.—Exports in 1958 totaled $40,277,070, of which rubber accounted for $26,122,934; iron ore, $8,074,524; diamonds, $2,263,516; and palm kernels, $1,005,740. Imports of machinery and assorted manufactured items and foodstuffs totaled $27,796,359 in 1958. The United States purchased 74.8% of Liberia's exports and supplied 54% of her imports.

Principal Events, 1959.—On July 19, following a 4-day meeting at Sanoquelli (near the Guinea border), President Tubman, President Sékou Touré of Guinea, and Prime Minister Kwame Nkrumah of Ghana issued a joint proposal for a 1960 conference to set up a "Community of African States." At Monrovia on August 4–8, the 9-member Conference of Independent African States called for support of the rebel Algerian provisional government against the French, and opposed the French plan to test nuclear weapons in the Sahara.

A general wage increase for unskilled labor in most enterprises followed a successful 3-day strike by 400 workers at Monrovia's free port in May. The boom in public and private construction continued in 1959. A new motion picture theater, an 11-story hotel, and several public buildings were completed or under construction.

Liberia received $12,750,000 in new foreign loans, including a $7,265,000 Export-Import Bank of Washington loan for electric power expansion and a $3 million U.S. Development Loan Fund issue for telecommunications improvement (only Monrovia now has telephone service).

BERNARD BLANKENHEIMER,
Chief, African Section, Near East and African Division, Bureau of Foreign Commerce, U.S. Department of Commerce.

LIBRARIES. Federal Legislation.—Library development in the United States has been aided in the last three years by the Library Services Act, passed in June 1956. The act authorized the appropriation of $7.5 million annually for five years for grants to the states for the extension and improvement of rural public library service. Fifty-two states and territories (all but Indiana) participated in 1959. The federal appropriation for fiscal 1960 was $6 million, but grants were to be made on the basis of a $7.5 million appropriation. This was the first time the full authorization had been made available.

As a result of the act, over 800 rural counties received new or improved public library service. Some 30 of these counties previously had no library service within their borders. More than 120 new bookmobiles and other vehicles have been placed in operation in rural areas by state library agencies, and over 130 county and regional library projects have been organized. State library agencies have added more than 70 field consultants, 100 additional professional librarians, and 300 clerks, bookmobile drivers, and other employees. Many states have expanded services available before the act went into effect; and cooperative buying, centralized processing of books, and new mechanical equipment are now in operation in some states.

California, Nevada, and Pennsylvania conducted and published comprehensive surveys of their public library systems, including present services, assessment of needed improvements, and recommendations for methods of obtaining appropriate development. The California and Pennsylvania surveys were particularly noteworthy for the careful collection of statistics and the wide variety of information they contained. Legislation based on the studies was proposed in the 1959 state legislatures, and it seems likely that significant advances will result from the surveys. Hawaii started a statewide survey in November 1959. Missouri, New York, South Carolina, Virginia, and Wisconsin incorporated library education scholarship plans in their Library Services Act programs.

Federal, state, and local funds for the extension and improvement of public library service to rural areas totaled $17,324,632 for fiscal 1959. State

funds to match the federal grants have increased more than 45% since the program began three years ago, and equal about half the total expenditures.

The National Defense Education Act of 1958 (see EDUCATION) has benefited school libraries, especially under Title III, which provides for federal funds to strengthen programs in science, mathematics, and modern foreign languages. Within the limitations imposed by individual state plans, school libraries have been able to improve their collections of both printed and audio-visual materials in these subject areas.

There was much activity in regard to library legislation during the first session of the 86th Congress. Most of the bills, still pending at adjournment, were expected to pass during the second session. Libraries made considerable progress toward being included in legislation relating to educational institutions.

State Legislation.—A steady growth in library support by state governments was apparent in 1959. Legislation passed by the Nevada Legislature permits county library trustees to contract with the board of county commissioners of any other county for library service, and enables two or more political subdivisions to create a regional library through written joint agreement. The state librarian was specifically authorized to provide technical and financial assistance to other libraries. These laws provide the framework for the recommendations of the Nevada survey conducted under the Library Services Act.

New Jersey passed a state aid law in which each municipality supporting library service "shall qualify for state aid of 35¢ per capita, provided that (1) its annual appropriation for library purposes shall be equal to or in excess of the local fair share, and (2) it shall be a member of a county library system or its annual appropriation for library purposes shall be not less than $50,000. . . ."

An unusual feature of the Pennsylvania legislation (still under consideration in 1959) is payment by the state for local service. Three of the four regional research centers would also serve as district library centers and would be eligible for three types of state aid: 25 cents per capita for the population which they serve directly, 25 cents per capita for the people in the district outside their service area, and up to $100,000 as regional centers.

Bills authorizing various forms of state aid to public libraries were rejected by legislatures in Florida, Indiana, and Massachusetts, while six other states passed legislation affecting libraries and their administration or support.

National Library Week.—The second annual National Library Week was celebrated on April 12–18, 1959. Observance of the week was sponsored by the National Book Committee (independent, nonprofit) in cooperation with the American Library Association (ALA), with the support of 30 other national organizations which share similar convictions concerning the importance of reading in American life.

Statewide committees of citizens were formed in 46 states and the District of Columbia to plan activities. Committee members represented a cross section of leadership in industry, professional and religious organizations, schools, and labor unions. In other states, programs were initiated by committees of librarians. Well over 5,000 communities participated in National Library Week. In Washington, observations appropriate to the week were sent out with 750,000 telephone bills; in New Hampshire, 20,000 Pogo leaflets on National Library Week topics were distributed by 70 supermarkets and restaurants; and in Montana, home demonstration clubs sponsored a survey of family reading. Colleges, universities, and high schools focused the attention of students and faculty on libraries and on the development of lifelong reading habits.

National Library Week themes were used in 36 magazines with a total circulation of 103,061,308. Fourteen network radio and television programs (estimated audience, 151 million) and more than $1.4 million (based on commercial value) in spot time, including more than 500 local television programs and nearly 2,000 local radio programs, were devoted to National Library Week.

Canadian librarians and publishers formed a new group, the Canadian Library Week Council, Inc., to celebrate the week simultaneously with the United States. There were also observances in Brazil, Colombia, El Salvador, and Verona, Italy.

These activities increased awareness and support of libraries, stimulated gains in circulation and registration, and created a climate of greater concern for the status of reading in the community. The ALA scheduled the third National Library Week for April 3–9, 1960, and voted to continue the annual observance through 1962.

Public Libraries.—In 1958, overall expenditures for public library systems serving populations over 50,000 rose from nearly $111 million in 1957 to $118.5 million in 1958. The systems added over 5,751,000 volumes, bringing the total to over 76.5 million volumes available. Circulation of these books exceeded 250 million. In cities of over 100,000 population, approximately 14.5 million more volumes were circulated in 1958 than in 1957, representing the largest annual increase since 1950.

The U.S. Office of Education published *Statistics of Public Libraries: 1955–56* as a chapter of the *Biennial Survey of Education* for the first time in 1959. The foreword says: "This is in keeping with the Office of Education's recognition of the important role played by public libraries in the educational and cultural life of the Nation." Of the 6,249 public library systems reporting, 58.4% served populations under 5,000, compared with 66.8% in 1939. Only 403 systems (or 6.5%) served populations of over 50,000. The survey indicates that local public funds continued to be the major source of public library income: 87.3% ($162 million) came from local sources in 1955–56; 2.7% ($5 million) from state funds; 4.3% ($8 million) from endowments and gifts; and 5.7% ($10.5 million) from other sources. The most noticeable changes, albeit gradual ones, were in the increasing proportion of funds from state sources and the decreasing amount from endowments and gifts.

The largest expenditures continued to be for salaries—61% ($104 million) in fiscal 1956, an increase from the 55% ($26.75 million) devoted to salaries in 1939. A total of 29,974 full-time and 21,675 part-time personnel were employed by reporting libraries, including 13,822 full-time and 3,522 part-time professional librarians.

Expenditures for books, periodicals, and audio-visual materials increased from $8.75 million in 1939 to $26.75 million in 1956. Only 3.9% of the reporting libraries had annual operating expenditures over $100,000, the figure suggested in the Public Library Inquiry (1950) report as the minimum necessary for adequate public library service in a single system. Approximately 11.5 million volumes were added to public libraries during 1955–56; and over 173 million, or 1.5 books per capita, were available to the 117.5 million people served by the public library systems reporting. Only 272

systems reported collections of over 100,000 books, while 17 public library systems held over a million volumes each.

Approximately 490 million volumes were circulated during the 1956 fiscal year, an increase of more than 100 million over 1950. During the same period, the per capita circulation of books rose from 3.4 to 4.2—an impressive testimony to the growing use of library books at a time when all predictions have suggested the contrary.

Hundreds of cities and towns are planning new public library buildings or have them under construction. New buildings have become necessary because of larger service areas, increased population, progression from temporary bookmobile service to permanent branch libraries, newly created regional branches in the larger cities such as Los Angeles and New York City (Borough of Queens), and obsolescence of existent buildings. Among the cities which completed public library buildings in 1959 are Minneapolis, Minn.; Kalamazoo, Mich.; South Bend, Ind.; and Whittier, Calif.

The Book of the Month Club presented $5,000 in books to the Arlington (Vermont) Public Library as the first Dorothy Canfield Fisher Award. The same sum will be made available each year to a small library meeting the club's criteria. The recipient of the award selects its own books.

Operation Library, sponsored by the International Junior Chamber of Commerce, had no national projects in 1959, but local chapters helped their libraries get bond issues passed and cooperated in other library projects. In a Junior Chamber of Commerce contest including all of the organization's community projects, the Mascoutah, Ill., chapter was awarded first place in the state competition and second place in the national competition for its Operation Library project. The Mascoutah chapter organized a successful campaign for a regional library in southern Illinois, bringing library service to many people who had never had it before.

Governors' conferences planned to assist public library trustees were held in four states in 1959: Missouri, New Jersey, Pennsylvania, and Wisconsin. Increased community interest in all kinds of libraries was shown by the number of new Friends of the Libraries groups.

College, University, and Research Libraries.—Standards designed to provide a guide for evaluation of libraries in American colleges and universities which emphasize four-year undergraduate instruction were adopted in 1959 by the Association of College and Research Libraries, a division of the ALA. (The ALA does not accredit college libraries, but the new standards should help them improve their situation.) The standards recommend that libraries in the same community, region, state, or nation pool their resources, and that academic status be accorded to professional librarians. Among such cooperative efforts have been the preparation of union lists of serials in the Southeast and other regions, and a joint acquisition agreement between the Detroit Public Library and Wayne State University.

Total library expenditures in college and university libraries increased in 1958, but not in the same proportion as total university expenditures. Median beginning salaries for librarians showed an increase in all sizes of colleges, with the beginning salary ranging from $4,000 to $4,500.

The Grants Program of the Association of College and Research Libraries (ACRL) received funds totalling $172,500 in 1955–59. In 1959, 76 grants of $500 or less were made to private colleges for materials. Most of the funds received were from the United States Steel Foundation. A grant from the Council of Library Resources, made possible a two-year continuation of the Farmington Plan, a cooperative agreement among several research and university libraries for the purchase of significant foreign technical books.

WIDE WORLD

***(Top)* Bookmobile from the Delmar (N.Y.) Public Library, destined for the American National Exhibition in Moscow, is loaded onto a ship in Brooklyn, May 20. *(Bottom)* Muscovites attending exhibit wait in line to view bookmobile.**

Ground was broken for the National Library of Medicine in Bethesda, Md., on June 12, 1959 (to be completed in 1961). New library buildings were completed in 1959 at Colgate University, the University of New Hampshire, Drexel Institute of Technology, Barnard College, Grinnell College, Hunter College, Wingate College, and the American Philosophical Society of Philadelphia.

School Libraries.—The year 1959 marked a growing emphasis in the development of centralized elementary school libraries and in the increase in school library supervisory positions. California, Hawaii, and Oregon added supervisory positions at the state level.

New school library standards were approved by the American Association of School Librarians (AASL), a division of the ALA, and are to be published early in 1960. The standards are expected to give an impetus to the growth and improvement of school libraries.

A 1958 National Education Association research division monograph, *The Secondary-School Teacher and Library Services*, revealed that almost all urban secondary schools have a central library and that 88.8% of the teachers who replied believed that the library plays an important role in the total instructional program of the school. Rutgers University is studying the effectiveness of centralized library services in elementary schools. The project, begun in the fall of 1958, is to be completed in 1960.

The Stern Family Fund, a philanthropic and educational foundation, gave $5,000 to the AASL to place gift magazine subscriptions in 55 high schools serving rural areas. These magazines were selected as "windows on the world" publications to help bring about an understanding of other peoples and cultures.

State Libraries.—The first Assembly of State Librarians met at the Library of Congress on Nov. 12–14, 1958. Reference and archival services, service to the blind, responsibility for extension of public library service, depository and exchange responsibilities of the superintendent of documents and the depository libraries, and standards of service for state libraries were discussed.

The American Association of State Libraries, a division of the ALA, planned a survey of state libraries and their varied activities before writing qualitative standards. The Alaska and Tennessee legislatures passed bills in 1959 transferring their state libraries to their departments of education, while Idaho officially established the state library under the management of the Idaho State Library Board.

Education for Librarianship.—The ALA Council adopted the Standards for Undergraduate Library Science Programs and Guide in 1959. The standards may serve as a self-evaluation instrument for any institution offering undergraduate library education programs. The major requirements of the standards are that professional education for librarianship should encompass a minimum of five years of study beyond the secondary school, and culminate in a master's degree; and that the amount of undergraduate library science shall not be so great as to limit seriously the amount of general education. A student's undergraduate program shall not be fewer than 12 nor more than 18 semester hours. The guide was written specifically to be used by the National Council for Accreditation of Teacher Education, which had not yet adopted the guide in 1959.

Western Michigan University's Department of Librarianship was accredited in 1959 by the ALA's Committee on Accreditation, making a total of 32 accredited library schools in the United States and Canada.

Personnel.—The shortage of professionally trained librarians in 1958 is indicated by the ratio of vacancy notices to graduates, ranging from 140 to 1 in a small school to 10 or 25 to 1 in the large schools. An indication of the desperate shortage of qualified librarians is the willingness of administrators to waive experience requirements for a "good" candidate. In 1958 only 1,136 of the 1,263 graduates from 28 library schools were known to have taken library positions. Of these, the average salary was $4,683, an increase of more than $200 over 1957. The 1959 graduate had an even greater choice of openings, with even higher beginning salaries.

The most serious shortage was in public libraries, with the most acute need in cataloguing and children's work. There were several disturbing elements: the overemphasis on beginning salaries, the disregard for persons in the middle responsibility–middle experience group, and the disconcertingly stable enrollment in library schools. The New York metropolitan area increased the salaries of over 700 professional librarians in its three major public libraries by $300 to $1,200. In cooperation with state library associations, the ALA has sponsored workshops to train local librarians in better methods of recruiting. Recruiting pamphlets were distributed widely.

The librarian shortage is a major obstacle to library development in most of the economically less advanced countries of the world. To help meet the immediate need, students were sent abroad (principally to the United States and England) to library schools. In 1958 and 1959, Columbia University conducted special workshops in comparative librarianship.

International Developments.—An ALA-sponsored field seminar to improve the range and quality of reference and advisory services in Japanese libraries received a grant of $40,450 from the Rockefeller Foundation to provide for preliminary seminars in Japan and for travel and seminars in the United States. The nine seminar members engaged in an intensive study of American library practices in and around five major United States cities.

A library school is to be established as a result of a survey of the library services of Ghana. Liberia will set up a national plan of library service in 1960.

The 25th annual council meeting of the International Federation of Library Associations met in Warsaw, Poland, in September 1959.

In Russian library schools, the day school enrollment doubled during 1948–58 and quadrupled in the evening courses. The on-campus and correspondence courses at Leningrad State Library Institute (one of three Soviet library schools of university rank) produced about 600 trained librarians in 1958.

The American Book Publishers Council, asked by the departments of State and Commerce to furnish a book exhibit at the United States National Exhibition in Moscow in 1959, chose a library bookmobile as a dramatic way to give meaning not only to the book publishing business but also to the use of books in the United States. The bookmobile was loaned by Delmar, N.Y., and sent by the ALA. On August 19 it was necessary to close the bookmobile because the Russian people, who could not buy the books, had borrowed all of them. By August 22, after a story on the closing was featured in the New York *Times*, 1,800 hardbound and 1,000 paperbound books (gifts of booklovers and publishers) were on a plane bound for Moscow.

In September, more than 200 persons from 10 countries met at Western Reserve University's Documentation Research Center in Cleveland for a conference on standards for machine searching and translation.

International appointments in 1959 included Josef Stummvoll, formerly director general of the Österreichische Nationalbibliothek, to succeed Rubens Borba de Moraes of Brazil as director of the United Nations Headquarters Library in New York; Carl White, professor at the Columbia University School of Library Service, as director of the Institute of Librarianship at the University of Ankara, Turkey; and Luis Florén, as director of the Escuela Interamericana de Bibliotecología at the Universidad de Antioquia, Medellín, Colombia.

RUTH M. WHITE,
Assistant to the Executive Secretary, Public Library Association.

LIBRARY OF CONGRESS. On April 24, 1800, an act of Congress created a small parliamentary library to serve the nation's lawmakers. Since then, through gifts, copyright deposits, purchases, and exchange, the Library of Congress has become one of the world's largest libraries, containing by June 30, 1959, more than 38 million items. These included some 11.7 million books and pamphlets in every written language; 2.4 million maps and other cartographic items; 2 million volumes and pieces of all types of music; and 2.9 million photographic prints, slides, and negatives. There were also 163,000 bound volumes of newspapers and hundreds of thousands of individual issues; 583,000 fine prints and reproductions; 107,000 phonograph recordings of music, poetry, and speeches; 429,000 "talking books" for the blind; 124,000 motion-picture reels and, in the form of paper prints, more than 3,000 of the earliest American movies; and 173,000 reels and strips of microfilm. In addition, the library has more than 16 million manuscripts relating to American history and culture, including the papers of 23 presidents of the United States.

During the fiscal year 1959, the Legislative Reference Service, which is the main research arm of Congress, answered nearly 77,000 inquiries from members of Congress and from congressional committees; other divisions of the library handled more than 43,000 additional congressional requests for information or books. Nearly 673,000 readers were served by all departments of the library, which answered more than 345,000 inquiries for them. Readers used nearly 2.1 million books and other items in the two library buildings and in the Law Library in the Capitol. Although the library is not primarily a lending library, almost 222,000 items were lent to members of Congress, government agencies, and other libraries. The library also administers a national program of books for the blind, which in the calendar year 1958 lent 1,650,000 volumes to 58,931 blind readers. These volumes included "talking books" and books in braille and Moon type.

In its two income-producing operations, the library again set new records in the fiscal year 1959: $2,043,099 was derived from the sale of technical publications and more than 30 million printed catalogue cards; the Copyright Office took in $979,941 in fees. Receipts from such sales and fees are transferred to the U.S. Treasury. Works deposited in the Copyright Office with the 241,735 claims that were registered for copyright served as a major source of currently published material for the library's collections. (See also COPYRIGHTS.)

Funds obligated by the library in the 1959 fiscal year were $19,095,656, with $13,389,191 from congressional appropriations, $4,332,665 from transfers from other government agencies, and $1,373,800 from gifts and other sources.

The library added more than 1.2 million items to its holdings during the fiscal year. Important acquisitions included holograph letters of Benjamin Franklin and Abraham Lincoln; rare printings of the Emancipation Proclamation; the papers of Paul Wayland Bartlett, Elmer Davis, Marquis James, Jesse Jones, Alton B. Parker, and Theodore Roosevelt, Jr.; and additions to the papers of Harold Ickes, Jacob A. Riis, Kenneth Roberts, Arnold Schoenberg, and Robert A. Taft. Musical manuscripts included those of Samuel Barber, Leonard Bernstein, Aaron Copland, Roy Harris, Henry Dixon Cowell, Victor Herbert, Gian-Carlo Menotti, Walter Piston, Richard Rodgers, Sigmund Romberg, William Schuman, Leo Sowerby, Alan Hovhaness, and Wallingford Riegger.

To acquaint government departments and private scholars with its holdings, the library publishes accessions lists, bibliographies, and catalogues. Those published in the fiscal year 1959 include the fifth and final volume of the *Catalogue of the Library of Thomas Jefferson; East and Central Europe: Periodicals in English and Other West European Languages; Selected Maps and Charts of Antarctica; Air Pollution Bibliography;* and the 50-year-old *Monthly Checklist of State Publications.* A monthly *World List of Future International Meetings* was initiated.

In the library's 1958–59 concert season, the Whittall Foundation sponsored 31 concerts of chamber music; the Coolidge Foundation sponsored 6 such concerts in the library and 33 extension concerts in other cities. The Coolidge Foundation commissioned 4 composers to write new scores, and the Serge Koussevitzky Foundation commissioned works by 12 composers. The annual literary series sponsored by the Gertrude Clarke Whittall Poetry and Literature Fund included readings by Carl Sandburg, Robert Frost, Padraic Colum, Allen Tate, and Eudora Welty, as well as performances of Shakespearean plays.

The Lincoln Sesquicentennial Exhibition of 250 rare items, including 2 recently restored daguerreotypes of President and Mrs. Lincoln, was opened on Feb. 12, 1959, by Vice President Richard M. Nixon, Speaker of the House Sam Rayburn, Sen. John Sherman Cooper (Chairman of the Lincoln Sesquicentennial Commission), and Librarian of Congress L. Quincy Mumford. Among the 64 other exhibits presented during the year were the 17th National Exhibition of Prints. Displays marked the sesquicentennial of the birth of President Andrew Johnson, the bicentennial of the birth of Noah Webster, and the centennial of the births of A. E. Housman and Victor Herbert.

Through a $200,000 grant from the Council on Library Resources, Inc., the library established a project to inventory some 27,000 important manuscript collections throughout the nation, including 3,000 collections of its own. A study of problems in preserving sound recordings in libraries, initiated by the library in the fiscal year 1958 through a $65,000 grant from the Rockefeller Foundation, was completed by the end of the fiscal year 1959. Also during the year the library launched a research project, conducted for it by Recording for the Blind, Inc., to develop 8⅓-rpm. records and record players to provide blind readers with handier machines and longer-playing "talking books" for less than the present cost per book.

ELIZABETH E. HAMER,
Information and Publications Officer,
The Library of Congress.

LIBYA. A monarchy on the northern coast of Africa. Estimated area, 679,358 square miles; pop. (est. July 1, 1958), 1,153,000, predominantly Arab Moslems. Europeans number about 60,000, mostly Italians in Tripolitania. Arabic is the official language. Tripoli (pop. est. 1958, 172,202) and Bengasi (Benghazi; pop. 1954, 70,532) alternate biennially as the capital. A third capital, at Beida, was under construction in 1959.

Government.—Libya is a federation of three provinces: Tripolitania (est. pop., 746,000), Cyrenaica (291,000), and Fezzan (54,000), which exercise considerable autonomy through their respective provincial assemblies and councils. On the federal level, the king (Mohammed Idriss el Senussi) wields the chief power. He may introduce or veto legislation and dissolve the lower house of Parliament at his discretion. The Libyan Senate consists of 24 members (8 from each province) who serve for 8 years; 12 are appointed by the king and 12 by the provincial assemblies. The House of Representatives has 55 members (35 from Tripolitania, 15 from Cyrenaica, and 5 from Fezzan) elected by male suffrage for 4 years. Abdel Majid Kobar has served as premier of the federal council of ministers since May 26, 1957.

Libya obtains annual subsidies from Great Britain, which maintains military bases at Tobruk and Bengasi; from the United States, which maintains a large airbase at Wheelus Field, near Tripoli; and France, which contributes toward the maintenance of airfields in Fezzan. These nations also provide economic and technical aid, as do Italy, the United Arab Republic, Turkey, and the United Nations. Britain and the United States supply arms and equipment for Libya's armed forces.

Education and Religion.—School facilities are available to a relatively small number of children, and over 85% of the population is illiterate. In 1957 there were 502 primary schools (96,763 pupils), 53 secondary (6,886), 8 technical (722), and 4 teacher-training (1,568). One higher institution had 71 students in 1956. Islam is the state religion, but other faiths have freedom of worship.

Finance.—The budget approved by the Libyan Parliament for the fiscal year beginning April 1, 1959, estimated expenditure at L£13.4 million. Of this total, L£5.0 million was allocated to the federal government, L£6.2 million to the three provinces, and the remainder to development agencies. Domestic revenue was not expected to yield more than half the total expenditure; the rest was to come from foreign aid. United States aid in 1958–59 totaled $19 million ($8 million in the form of budget support and direct contributions to development agencies). Under an agreement of 1958, Britain's annual budget contribution amounts to £3,250,000. Libya is a member of the sterling bloc. The Libyan pound (L£) equals U.S.$2.80.

Transportation and Communications.—Inland transport is largely by caravan, over traditional routes. A coastal highway of about 1,140 miles runs from the eastern to the western border. Motorable roads in Tripolitania and Cyrenaica total about 2,490 miles. Three main railroad lines from Tripoli aggregate 119 miles; 2 lines from Bengasi total 101 miles. Libyan Airways provides internal air service. Passenger cars in 1958 totaled 10,632; telephones, 8,264; radio receiver licenses, 19,000 (1956).

Production.—Agriculture and animal husbandry are the main occupations. Fertile areas lie mainly along the Mediterranean coast; the inland regions are largely semidesert or desert. Output of cereals, chiefly barley and wheat, averages about 110,000 tons annually. Citrus fruit and olives (olive oil output, est. 1957–58, 14,300 tons) are grown mostly by Italians. Other crops are esparto grass, tobacco (1958 output, 1.9 million pounds), castor beans, almonds, vegetables, and dates. Sheep and goats provide wool and other animal products. Coastal fisheries yield sponges, tuna, and sardines. Manufactures include foodstuffs and beverages, soap, leather, bricks, tobacco products, and traditional handicrafts, such as rugs and carpets.

Important sources of income are foreign subsidies, expenditures by foreign armed forces, and outlays by foreign oil-prospecting companies. The Libyan Public Development and Stabilization Agency, which operates mainly with funds from Britain, and the Libyan-American Reconstruction Commission, financed by the United States, have concentrated on long-range projects to raise agricultural and industrial productivity. The U.N. Food and Agriculture Organization is seeking to spread modern methods of dry-land farming and sheep raising.

Foreign Trade.—Exports in 1958 totaled L£5.5 million; imports, L£34.5 million (including L£10.1 million in direct imports by oil-prospecting companies). Esparto grass, castor seed, wool, and

scrap iron (from World War II battlefields) accounted for 51% of the value of exports. Italy purchased 37% of exports; the United Arab Republic, 17%; and Britain, 15%. Italy provided 22% of imports; Britain, 22%; and the United States, 21%.

Principal Events, 1959.—Oil-prospecting efforts yielded their first significant successes in 1959, a development which may have important consequences for Libya's marginal economy. On June 12, Esso Standard (Libya) Inc. announced that a well at Zelten, in northwest Cyrenaica, had reached a daily flow of 17,500 barrels. A second well at Zelten was reported on August 19 to have attained a daily flow of 15,000 barrels. A smaller strike about 200 miles south of Tripoli had already been reported by the Gulf Oil Company in May, and several other strikes were reported during the year.

The United States agreed in May to provide financial aid directly to the Libyan government, instead of through United States agencies. An agreement for a $5 million loan from the U.S. Development Loan Fund for the expansion of electric power facilities in the Tripoli area was signed by Libya on June 29.

M. J. G.

LIECHTENSTEIN. A sovereign principality of central Europe, located between Switzerland and Austria. Area, 61 square miles; pop. (est. 1959), 16,000. The capital is Vaduz (3,031). Prince Francis Joseph II (b. 1906; acceded 1938) rules with the aid of a 15-member Landtag elected for a four-year term by male suffrage. Dr. Alexander Frick has been chief of government since 1945. Budget estimates for 1959 were: revenue, 10,106,660 Swiss francs; expenditure, 10,254,924. In 1958 there were 14 elementary and 5 continuation schools with a total of 2,733 pupils. Corn and other grains, grapes, potatoes, and vegetables are grown. Manufactures include machine parts, instruments, leather goods, textiles, and pottery. Liechtenstein has a customs union with Switzerland. On Oct. 23–24, 1959, representatives of Liechtenstein, Monaco, San Marino, and Andorra conferred at Vaduz on measures to promote tourism.

LIME. In 1958 the production of lime in the United States declined 10%, from 10.3 million short tons in 1957 to 9.2 million tons. Details of the sales and uses of lime are shown in the table.

	1956	1957	1958
Sales, total	9,004,139	8,516,132	7,388,231
Quicklime	7,047,079	6,650,584	5,545,874
Hydrated	1,957,060	1,865,548	1,842,357
Uses:			
Agricultural	251,906	208,600	196,125
Building	1,133,383	1,037,689	1,128,875
Industrial	5,216,884	5,038,134	4,422,159
Refractory	2,401,966	2,231,709	1,641,072

(Source: U.S. Bureau of Mines.)

In the first nine months of 1959, the total lime sold was 6,814,437 tons, compared with 5,551,565 tons in the same period of 1958. Sales of agricultural lime totaled 141,234 tons in the first nine months of 1959 (139,394 in 1958); building lime, 868,685 tons (789,020 in 1958); industrial lime, 4,337,493 tons (3,487,141 in 1958); and refractory lime, 1,467,025 tons (1,136,010 in 1958).

LINGUISTICS. Among new publications of 1959 in the field of linguistics is *Anthropological Linguistics* (F. M. Voegelin, editor), which will publish material from the collection of tape recordings in the Archives of Languages of the World, at the University of Indiana. The first numbers contain papers presented at the 1958 meetings of the American Anthropological Association on the subjects of operational models, genetic classification, and urbanization and standard language. Another newcomer in *Lochlann*, a journal devoted to Celtic languages, literature and culture; it is edited by A. Sommerfelt in Oslo.

In Washington the Modern Language Association has set up a Center for Applied Linguistics, with C. A. Ferguson as its first director, to serve as a clearing house for institutions and individuals concerned with the application of linguistic science to practical language problems. The need for such a service had become immediate, partly in connection with the program of language development announced under the provisions of the National Defense Education Act of 1958. Aside from training activities in language institutes (to increase teaching competence) and centers (to develop teaching in new fields), several research programs of fundamental interest have been inaugurated by the center. These projects include the graphic recording of speech intonations (J. M. Cowan), a study of the incidence of speech disorders in foreign language acquisition (E. Hocking), and contrastive structure studies designed to reveal those aspects of a target language which need particular emphasis (through drill) for the speakers of a given first language. The center publishes *The Linguistic Reporter*.

The death in Paris, late in 1958, of Paul Rivet, one of the great Americanist linguists, was deeply felt. Manu Leumann of Zurich was honored on his 70th birthday by the publication of his collected *Kleine Schriften*. Another item of partly biographical interest is J. Chadwick's *Decipherment of Linear B*, describing the history of the discovery made by the author together with the late M. Ventris. A large portion of the 1958 *Transactions* of the Philological Society, London, is taken up by L. R. Palmer's studies developing aspects of their work on early Mediterranean syllabic writing. J. W. Poultney has written a comprehensive work on the Umbrian *Bronze Tables of Iguvium*. James G. Février's *Histoire de l'écriture* has been entirely remade.

Interest in linguistic theory is increasingly and quite wholesomely influenced by such technological applications as mechanical translation and information retrieval. Thus Georgetown University has copyrighted a series of *Occasional Papers on Machine Translation*, and similar work has been coming from the Soviet Union and from other countries. The direction seems to be away from statistical and toward algebraic approaches. There have also been more serious efforts than in the past to deal with borderline areas between linguistics and psychology, as is evident from the discussion which has followed R. Brown's *Words and Things* (1958)[1] or from N. Chomsky's critique of B. F. Skinner's *Verbal Behavior* (1957),[2] or again from various exchanges between U. Weinreich and the authors of *The Measurement of Meaning* (1957)—C. E. Osgood, G. J. Suci and P. H. Tannenbaum—in the pages of *Word*. Pedagogical application of good linguistic analysis still has a long way to go; but it is to be hoped that our schools will not ignore as too revolutionary such

[1] See, for example, H. Hoijer's review in *Language*, vol. 35, pp. 496–50.
[2] Ibid., vol. 35, pp. 26–58.

an excellent work as the *Short Introduction to English Grammar* by J. Sledd.

Work in phonetics has been given a welcome tool in E. Pulgram's *Introduction to the Spectrography of Speech,* in which both acoustic and linguistic methods are brought together in an effort to bring the linguist's understanding of the physics of sound up to date.

Language classification is indebted to the Indiana Archives mentioned earlier; a notable publication is H. Wolff's *Subsystem Typologies* and *Area Linguistics.*[3] Glottochronology is again discussed—for example, by W. Arndt [4] and by D. H. Hymes and A. I. Samarrai.[5] B. Geiger, T. Halasi-Kun, A. H. Kuipers and K. H. Menges have published the fruits of their labors for the Human Relations Area Files in a reference pamphlet, *Peoples and Language of the Caucasus.* A large body of *Clackamas Chinook Texts* (Part 2) has been published by M. Jacobs.

An international congress of classical scholars was held in Great Britain in 1959. The Linguistic Society of America and the Modern Language Association met in Chicago, the American Oriental Society in Ann Arbor, Mich., and the American Philological Association (including a panel on the teaching of classical languages) in New York City.

HENRY M. HOENIGSWALD,
Professor of Linguistics,
University of Pennsylvania.

LITHUANIA. An independent republic since 1918, Lithuania was forcibly annexed by the Soviet Union in 1940, and reannexed by force after World War II, thus becoming the Lithuanian Soviet Socialist Republic. The United States does not recognize this annexation.

Area and Population.—Lithuania's area is about 25,000 square miles; its population (1959), 2,713,000, of which only 39% is urban. The principal cities, with 1959 populations, are Vilnyus (Vilna, Wilno), the capital, 235,000; Kaunas (Kovno), 214,000; Klaipeda (Memel), 89,000; and Šiauliai (Shavli), 60,000. About 80% of the people are Lithuanians, an Indo-European ethnic group. There are large Russian and Jewish minorities.

Government.—Lithuania's legislature is a one-chamber Soviet of 209 deputies elected for 4-year terms. It rarely meets, and in the interim between sessions its authority is delegated to the Presidium headed by J. D. Paleckis and to the Council of Ministers (cabinet) under the chairmanship of Premier M. Y. Sumauskas. The Lithuanian government has no political autonomy, however, and acts chiefly as an agent executing orders of the USSR government. All key positions are held by Communists, many of whom are Russians. The head of the Lithuanian Communist Party is First Secretary Antanas J. Snechkus.

Finance.—The Lithuanian budget for 1959 provided for expenditures of 4,264,758,000 rubles ($1,066,189,500), or 425,758,000 rubles more than in 1958. This increase did not particularly benefit the Lithuanian standard of living, since it represented chiefly the transfer of industrial construction funds from the USSR central budget to the Lithuanian budget.

Religion.—Because of Soviet persecution of the prevailing Roman Catholic religion, less than one fourth of Lithuania's Catholic priests were still conducting services in 1959, and most of the bishops were in prison. In March, the Communist press severely attacked the Shaker religion, which has some followers in the cities.

Education.—School attendance in 1959 totaled approximately 436,000, including 24,000 students in colleges. During summer vacation many college students were forced to work in the "new lands" of Siberia and north-central Asia.

Economy.—By 1959, Lithuania's peasant population was almost completely collectivized in 1,800 collective farms and 87 state farms. The advance of the campaign to move isolated farmsteads into collective villages meant that the peasants would be under stronger government supervision. Approximately 5,100,000 acres are under cultivation, the main crops being rye, oats, wheat, corn, potatoes, flax, clover, and sugar beets. Livestock raising is very important, and the sale of livestock products accounts for half of all collective farm income. The agricultural section of the Seven-Year Plan (1959–65) stresses the expansion of stock raising and calls for increased acreage under vegetables, sugar beets, and flax. The output of farm produce in 1965 is planned to increase over 1958 by the following percentages: grain, 80–100; potatoes, 110; sugar beets, 80–110; fiber flax, 70; meat, 50; milk, 60–70; and butter, 70. The reclamation of land by swamp drainage, which has been proceeding very slowly, is to be accelerated.

Under Soviet rule, Lithuanian industry has at least doubled in size, emphasis being placed on the production of capital goods. In 1959 shipbuilding, turbine construction, manufacture of electrical machinery, machine tool making, and fishing were the major industries. The industrial section of the Seven-Year Plan is concentrating mainly on the expansion of machinebuilding, light industry, food processing, and fishing. Industrial output in 1965 is planned to increase over 1958 by the following percentages: all industry, 80; machinebuilding, 160; electric power, 190; linen, 150; and shoes, 100. The fish catch is expected to increase by 70%. Completion of the Dashava-Minsk-Vilnyus gas pipeline is planned for 1962.

Principal Events, 1959.—Political dissatisfaction continued during 1959, the main complaints being directed against the low standard of living, Communist persecution of the Catholic Church, and Russian rule. Party Secretary Snechkus publicly criticized the Lithuanian masses for nationalism, concealment of industrial failures, embezzlement of state funds, and failure to deliver sufficient farm produce to the cities. This criticism confirmed reports of refugees that mass slowdowns in industry and petty sabotage on farms were prevalent. Open revolt would appear to be unlikely, however, since large numbers of Russian troops are stationed on Lithuanian soil. Refugees also reported that Klaipeda has large concrete shelters for submarines and has become the largest Soviet submarine base on the Baltic coast.

ELLSWORTH RAYMOND,
USSR Area Specialist and Associate Professor of Government, New York University.

LIVESTOCK. See Index entry.
LIVING STANDARDS. See STANDARDS OF LIVING.

LLOYD, (John) Selwyn Brooke, British foreign secretary: b. West Kirby, Cheshire, England, July 28, 1904. A successful barrister, and a staff officer during World War II, Lloyd was first elected to Parliament in 1945. He was appointed minister of state at the Foreign Office when the Conservative Party returned to power in 1951, and for the following three years he represented the United Kingdom at the U.N. General Assembly. In October 1954 he became minister of supply; in April 1955 he succeeded Harold Macmillan as minister of defense; and on Dec. 20, 1955, he succeeded him as secretary of state for foreign affairs in the cabinet of Sir Anthony Eden. He was retained in that office when Macmillan became prime minister on Jan. 10, 1957.

Lloyd and Prime Minister Macmillan made an official visit to the USSR from Feb. 21 to March 3, 1959. During March they conferred with Western heads of state in Paris, Bonn, Ottawa, and Washington, presumably reporting on their discussions

[3] *Anthropological Linguistics,* vol. 1; 7 pp. 1–88.

with the Soviet leaders. In April, Lloyd attended meetings with the French and German foreign ministers and U.S. Secretary of State Herter in Washington and Paris, preparatory to the foreign ministers conference in Geneva. While the Geneva Conference was in session (May 11–June 20 and July 13–August 5), the London *Times* on June 1 conjectured that Lloyd might soon be replaced as foreign secretary. The next day Prime Minister Macmillan denied this possibility before the House of Commons, and Lloyd was retained after the Conservative victory in the general election of October 8.

LOANS. See Index entry.

LODGE, Henry Cabot, U.S. representative to the United Nations and representative in the Security Council: b. Nahant, Mass., July 5, 1902. Chief of the United States mission to the United Nations since 1953, Lodge had been a Republican senator from Massachusetts, as was his famous grandfather, whose name he bears. In 1959 Ambassador Lodge served as President Eisenhower's personal representative to and escort for Soviet Premier Nikita Khrushchev (q.v.), during the latter's tour of the United States in September.

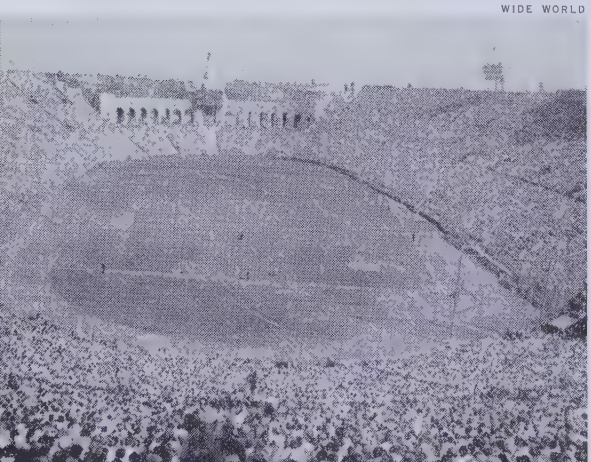
After his graduation from Harvard College in 1924, Lodge worked for eight years on the staff of the New York *Herald Tribune,* then turned to politics and ran successfully for the Massachusetts House of Representatives in 1932. After two terms in the state legislature he was elected to the U.S. Senate in 1936. With time out for military duty in 1941–42 and 1944–45, he served in the Senate until his defeat in 1952 by Democrat John F. Kennedy (q.v.).

Although Lodge sided with the isolationist wing of his party on many foreign policy matters before World War II, he subsequently became one of the leaders of his party's internationalist group. In 1952 he headed the preconvention campaign for the presidential nomination of General Eisenhower, who after the election named him to the United Nations post.

The ambassador's September tour with Premier Khrushchev was a trying assignment that called for diplomatic skill and agility. On the one hand Lodge was charged with countering Khrushchev's provocative propaganda sallies against the United States, and on the other hand he had to shield the premier from too vigorous ideological attacks by local political leaders—without either giving offense to the visitor or interfering with his freedom to inquire and debate during his trip.

Memorial Coliseum in Los Angeles, as it looked on October 4, 5, and 6 during 1959 World Series in which Los Angeles defeated Chicago. Coliseum's crowds of 90,000-plus on each of three days broke World Series attendance records.

WIDE WORLD



LOS ANGELES. Third most populous city (July 26, 1959, est., 2,435,300) in the United States, Los Angeles, Calif., is also the nation's largest metropolis in area (457.866 square miles). The population of Los Angeles County was increasing in 1959 at the rate of 556 persons each day.

A 15-member mayor-council is headed by Republican Mayor Norris Poulson, who was re-elected in 1957. Total estimated city budget appropriations (1959–60 fiscal year): $432,826,012. Estimated council-controlled appropriations (1959–60): $203,095,951. City tax rate (1959–60): $1.9346 per $100 assessed valuation. Assessed value of municipal property (1959–60) for tax purposes: $4.4 billion. Long-term debt total is $649,964,000, of which $403,595,000 is for Water and Power Revenue Bonds.

Total estimated metropolitan area employment (Oct. 1, 1959): 2,566,500; unemployment, 120,800. Value of manufactures of the metropolitan area (1958): $6.88 billion; retail sales, $8.98 billion. Total cargo carried (fiscal year 1958–59) through the Port of Los Angeles: 23,298,574 short tons, of which petroleum was the principal commodity. Assets of the city's harbor facilities total $160 million. Harbor revenues (fiscal year 1958–59): $7,600,000.

Accelerated construction of the metropolitan freeway system continued in 1959, with approval granted for the addition of 1,667 miles to the existing total. In air transportation, commercial jet service went into operation in January. The Municipal Department of Water and Power, largest such utility in the United States (total assets: over $900 million) announced that it would invest $71 million in new facilities during the fiscal year 1959–60.

Boasting a new $20 million Sports Arena, Los Angeles succeeded in "capturing" the Democratic National Convention (see DEMOCRATIC PARTY), which is scheduled to meet there in 1960. Located at Exposition Park, this stadium seats 35,000 persons. New sporting events, including hockey, can now be held in the city.

As the Los Angeles Dodgers Baseball Club began grading and filling operations on their new stadium at Chavez Ravine, the team won the National League pennant and went on to defeat the Chicago White Sox for the World Series baseball title. Three games at the Los Angeles Coliseum drew almost 93,000 persons each, the largest number of spectators at single games in the history of the World Series. (See also SPORTS, GAMES, AND SHOWS.)

During the year, crowds of 5,000 persons per day viewed the Von Gogh art exhibit at the County Museum Building. A Toulouse-Lautrec showing at the Municipal Art Center also attracted great attention.

Mayor Poulson continued his vigorous and sometimes controversial administration and was frequently in the news during the year. An altercation between the mayor and Soviet Premier Nikita Khrushchev (q.v.), during the latter's arrival in Los Angeles on September 19, drew national attention. Locally a conflict also developed between the mayor and the City Council over his desire to cut the city budget, particularly his reservations about pay increases for municipal employees. Later in the year many such employees received the increases they sought. The mayor also led a campaign to force auto makers to develop smog-arresting devices more rapidly.

In a special election of May 1959, the voters turned down additional old-age pension benefits for firemen and other civil servants, but they approved expansion of the city's network of fire substations and establishment of a fire-training academy.

The Los Angeles Chamber of Commerce claimed on Jan. 1, 1959, that the metropolitan area, which reached a population of 6,450,000 in 1958, had bypassed Chicago as the nation's second

largest urban complex, after New York. The chamber went on to point out that metropolitan Los Angeles was gaining population at an annual rate of about 240,000 persons, while Chicago's annual increase numbered only 100,000.

ANDREW F. ROLLE,
Associate Professor of History, Occidental College; Author of "An American in California."

LOUISIANA. South Central state, United States; admitted to the Union, April 30, 1812. The "Pelican State" ranks 31st in area and 20th in population among the 50 states.

Area and Population.—Area: 48,523 square miles (land, 45,162; inland water, 3,361), divided into 64 parishes. Population: (1950) 2,683,516; (est., July 1, 1958) 3,107,000. Urban places with populations above 10,000 (as estimated by the State Department of Health for 1959) are:

Alexandria	42,622	Lafayette	42,216
Bastrop	15,573	Lake Charles	56,050
Baton Rouge (*capital*)	154,465	Monroe	46,734
Bogalusa	21,314	New Iberia	21,201
Bossier City	23,057	New Orleans	653,888
Crowley	15,428	Opelousas	15,147
Gretna	16,715	Ruston	11,933
Houma	16,260	Shreveport	156,409
Jennings	10,673*	West Monroe	13,506

* Special census, Dec. 1, 1953.

Executive.—Chief state officers in 1959:
Governor: Earl K. Long (Democrat)
Lieutenant Governor: Lether E. Frazar
Secretary of State: Wade O. Martin, Jr.
Treasurer: Andrew P. Tugwell
Attorney General: Jack P. F. Gremillion
Comptroller: William Dodd
Supt. of Public Education: Shelby Jackson

Constitution and Judiciary.—The present constitution went into effect in 1921. The Supreme Court comprises seven justices; chief justice in 1959 was John B. Fournet.

Legislature.—The Louisiana Legislature (Senate, 39 members; House of Representatives, 101) met on May 11, 1959, for its regular 30-day fiscal session and adjourned June 9.

A joint legislative committee, assisted by state fiscal officers, had formulated the budget prior to the session, and this was approved by the legislature substantially as submitted.

There had been considerable discussion of the 19 different retirement systems in the state, and proposals were made to reduce the number. The special committee that studied the systems appeared to think that the teacher-retirement program could be merged with that of social security without injuring the benefits offered in the teachers' system. The latter had a surplus of $150 million which continued to increase. Some teachers felt that the proposed changes would wipe out the surplus and make their retirement benefits dependent on annual legislative appropriations.

The state's teachers procured appropriations sufficient for full implementation of a salary schedule (approved by the legislature in 1956), provided that subsequent oil leasing brought in more than $40 million. Some state officials, judges, and municipal and state police received salary increases, and all district attorneys were deprived of fees and placed on fixed salaries.

The governor tried without success to obtain legislation revising the voting machine board and setting back the Democratic primary by two weeks.

He called the legislature into special session on August 10 to enact his pet measures that the regular session had failed to pass. That evening motions were approved in the House (71 to 25) and the Senate (26 to 9) for immediate and final adjournment. This was the only action taken by the special session.

Finance.—In the 1958–59 fiscal year, state revenue of $714,665,642 comprised $426,317,920 from state tax sources, $169,849,070 from the federal government, and $118,498,652 from other sources. Tax revenue included $84,257,449 from a 2% general sales tax, $11,731,448 from individual income taxes, $18,677,391 from corporate income taxes, $61,845,846 from motor fuel taxes, and $24,634,036 from licensing. Expenditures of $633,276,785 included $213,397,577 for education, $166,940,643 for health, welfare, and safety, and $131,908,794 for highways. State long-term indebtedness on June 30, 1959, amounted to $315,416,463.50.

Banking.—As of June 10, 1959, the state's 42 national banks had $1,958,964,000 in assets, $1,399,795,000 in demand deposits, and $375,328,000 in time deposits. The 145 state banks had assets of $1,061,778,760.75, demand deposits of $715,179,195.26, and time deposits of $253,956,659.16.

Education.—School attendance is compulsory between the ages of 7 and 15, inclusive. The National Education Association estimated operating expenditures for Louisiana public schools in the 1959–60 school year at $233,000,000 ($373.40 per pupil). Revenue was expected to include $65 million from local school districts, $192,944,000 from the state, and $7,056,000 from the federal government. Capital outlays and interest payments amounted to $70 million, and teachers' salaries averaged $4,860 (high school, 5,150; elementary, $4,700).

WIDE WORLD

Gov. Earl K. Long, campaigning for nomination as lieutenant governor in the Louisiana primaries held December 6, is surrounded by admirers in Luling, La., on August 10.

In the 1959–60 school year there were an estimated 15,800 teachers and 545,000 pupils in public elementary schools and 9,609 teachers and 156,000 pupils in public secondary schools. College and university enrollment (1958–59) totaled 52,479 students.

Public Assistance.—In the 1958–59 fiscal year, public assistance expenditures from federal and state funds (excluding institutional costs) totaled $140,571,411.28, including $95,382,197.28 for the aged, $25,556,805.35 for dependent children, and $9,032,099.14 for the permanently and totally disabled. A monthly average of 262,000 persons received public assistance.

Labor Force.—The state's labor force totaled 1,107,500 on Aug. 15, 1959, including 146,500 agricultural workers. Nonagricultural employment of 755,600 on the same date was slightly below the figure of 762,000 for the previous August 15 and also below the 768,800 average for 1958. Of nonfarm employees, 19% were engaged in manufacturing, 23.3% in trade, and 17.6% in government. There were 51,100 persons unemployed on Aug. 15, 1959.

Manufacturing.—The state's 2,835 manufacturing plants in 1958 employed an average of 141,606 persons who received $644,145,009 in wages.

MAJOR LOUISANA MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.* (thousands of dollars)
Chemicals and products	16,915	$ 97,487	$304,826
Petroleum and coal products	14,270	92,545	292,456
Food and kindred products	30,546	101,024	266,676
Pulp, paper, and products	17,129	83,949	196,990
Lumber and wood products	17,919	45,285	77,668
Transportation equipment	9,412	45,013	73,328
Primary metal industries	3,847	20,823	70,700
Fabricated metal products	7,284	31,839	58,908
Stone, clay, glass products	4,947	22,206	57,233

* For definition see footnote 1 in the article *Industrial Production*. (Source: *Annual Survey of Manufactures: 1957.*)

Value added by manufacture (1957) totaled $1,508,640,000, and outlays for new plant and equipment amounted to $300,655,000. Production workers averaged $87.78 for an average workweek of 41.8 hours in August 1959.

Mining.—In 1958 Louisiana ranked second among the states in the value of its mineral output, with 9.18% of the national total. It was second in the output of carbon black, natural gas, and Frasch sulfur; third in aluminum capacity; and fourth in salt production (16% of national output).

LOUISIANA MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Clays[1]	755,000	$ 755,000
Natural gas (1,000 cu. ft.)[2]	2,451,587,000	316,255,000
Natural gasoline (bbl.)	18,645,214	50,371,000
Petroleum (bbl.)[2]	312,070,000	1,017,562,000
Petroleum gases (bbl.)	9,782,595	21,435,000
Salt, common	3,442,000	18,960,000
Sand and gravel	15,061,000	17,119,000
Stone	5,453,000	9,532,000
Sulfur, Frasch (long tons)	2,028,000	47,651,000
Other minerals	...	20,475,000
Total[3]	...	$1,517,415,000[3]

[1] Excludes certain clays, value for which is included under "Other minerals." [2] Preliminary. [3] Total adjusted to avoid duplication in the value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1959 was up to $208,157,000 from $199,196,000 for the corresponding period of 1958. For the full year 1958, income comprised $162,670,000 from livestock and livestock products, $198,885,000 from crops, and $29,702,000 from government payments. Principal income sources in 1958 were: cattle, $92,355,000; rice, $59,963,000; and cotton lint, $49,148,000.

LOUISIANA CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Corn (1,000 bu.)	14,559	15,960	17,490
Cotton lint (1,000 bales)	624	297	495
Cottonseed (1,000 tons)	253	127	206
Hay (1,000 tons)	462	605	572
Pecans (1,000 lb.)	16,490	14,000	21,000
Potatoes (1,000 cwt.)	456*	306	374
Rice (1,000 bags)	12,347	10,812	12,910
Soybeans (1,000 bu.)	1,196	2,860	3,312
Strawberries (1,000 lb.)	20,922*	14,060	14,800
Sugarcane for sugar & seed (1,000 short tons)	5,659	5,325	5,896
Sugarcane sirup (1,000 gal.)	2,728	2,275	2,240
Sweet potatoes (1,000 cwt.)	4,882*	4,779	5,022

* Average, 1949–57. (Source: U.S. Department of Agriculture.)

There were 114,000 farms in the state in 1958. Total acreage (1954) of 11,441,000 included 3,011,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 1,808,000 cattle and 3,385,000 chickens (excluding commercial broilers). Some 139,000 family and hired workers were engaged in farming during the week of Nov. 22–29, 1959.

Ports.—In the first nine months of 1959, overall tonnage crossing the public wharves of the Port of New Orleans was 5% greater than in the same period of 1958—or 6,845,051 tons compared with 6,528,702 in 1958. Significant rises in imports accounted for the gain. Export totals for the period were lower except in steadily increasing grain shipments, which rose 14%.

An 86% increase in the port's business is anticipated by 1970, when a 12-year, $120 million expansion program is scheduled for completion. In addition to $9 million spent on improvements in 1958–59, an investment of $51 million was to be made by 1961. Improvements during 1959 included expansion of the public grain elevator and construction of new wharf facilities.

The first five-mile section of the 76.5-mile, $100 million Mississippi River–Gulf Outlet was built in 1959. Scheduled for completion by 1967, this tidewater channel will provide Louisiana with a new outlet to the Gulf of Mexico.

The port of Baton Rouge in 1959 put into service a new $15 million bulk cargo terminal.

Transportation and Communications.—State and federal funds spent for highways in the 1958–59 fiscal year totaled $136,637,900, and 1,907 miles of new construction were completed.

Highways and roads on Dec. 31, 1958, totaled 47,507 miles (36,823 surfaced), including 6,527 miles of streets in incorporated places. Registered *motor vehicles* numbered 1,144,776 on July 31, 1959, including 864,331 passenger cars. There were (1958) 32 *railroads* operating 7,088.36 track miles and (1959) 11 regularly scheduled *airlines* and 176 *airports and airfields* (48 commercial and municipal, 5 military, and 123 private). In November a new $7.5 million terminal was dedicated at New Orleans' Moisant International Airport.

Communications media (1958) included 78 AM and 10 FM *radio stations;* 12 *television stations;* (1957) 19 daily *newspapers* (circulation, 731,610) and 100 other newspapers; and (Jan. 1, 1959) 254,600 business and 695,400 residential *telephones.*

Principal Events, 1959.—Gov. Earl K. Long made news headlines as a result of his efforts, May 24–26, to coerce the Louisiana Legislature into approving some measures he favored. His appearance before the legislature was televised, and tape recordings were made. His behavior alarmed his family and political friends, and he was flown to John Sealy Hospital, Galveston, Texas, where he entered the Harris Psychiatric Clinic on May 30. His wife, Mrs. Blanche Long, and Dr. Arthur Long, a cousin of the governor, appeared before Judge Hugh Gibson on June 2 and signed papers committing the governor for two weeks. A sanity hearing was held on June 16, and the next day Governor Long was moved to the Ochsner Foundation Hospital in New Orleans. Within 24 hours the governor walked out of the hospital and went by automobile to Baton Rouge. Sheriff's deputies of East Baton Rouge Parish and state police stopped the governor at the parish line, presumably on the request of his wife, and took him to the Southeast Louisiana State Mental Hospital in Mandeville.

The governor procured a legal staff headed by Joseph Arthur Sims of Hammond, to get him out of the hospital. A few minutes before the appropriate court was to convene for his sanity hearing on June 26, Long met with a quorum of the Board of Institutions. This board fired the director of institutions and the superintendent of the Mandeville hospital, and appointed a new superintendent. When the governor went into court, the new superintendent testified that the governor was sane, Mrs. Long did not make an appearance to offer testimony, and the court had no cause for action. Long again assumed his duties as governor and fired the state superintendent of police and a number of other state employees.

In related developments the governor, on the day before his hearing, filed a separation suit against his wife, and Mrs. Long filed an answer five days later. The suit was still pending as the year ended. Governor Long went on a vacation, starting July 11, into Texas, Juárez (Mexico), New Mexico, and Colorado. His unusual behavior attracted attention everywhere he went.

The governor's demeanor affected developments preparatory to the forthcoming gubernatorial campaign. Long contended that he would resign office in September and file as a candidate for governor, thereby circumventing the constitutional provision that a governor is ineligible to succeed himself. The State Central Democratic Executive

Committee refused to permit him to file as a candidate for governor unless he resigned first. Long eventually filed in the Democratic primary of December 6 for lieutenant governor on a ticket headed by James A. Noe. In the primary, Noe and Long finished well behind New Orleans Mayor de Lesseps S. Morrison, who topped the nearest of his 10 rivals, former Gov. Jimmie Davis, by a substantial plurality. Lacking the majority of total votes necessary for nomination, Morrison faced Davis in a runoff primary on Jan. 9, 1960. Davis won, and was virtually assured of election on April 19 against his Republican opponent.

Louisiana experienced no unusual weather in 1959. Rainfall was evenly distributed throughout the year, although total precipitation was less than in 1958. Hurricane Arlene was the only storm that caused any significant damage—more than $500,000 worth in St. James Parish. A 10-foot marble figure was dedicated at Lake Charles on June 27 in memory of the 500 people who lost their lives as a result of hurricane Audrey in 1957.

The level of business activity was approximately 9% higher in June 1959 than a year earlier, and through the year, unemployment generally declined, although it remained above average for the state. Other economic indexes were encouraging. By November, state tax collections were $52 million higher than a year earlier; for the first six months of 1959, deposits in state banks were $67,267,000 above those for the corresponding 1958 period; and as of October 1, 169,749 bales of cotton had been ginned, compared with 72,070 bales the year before. Production of all major crops except hay and sugarcane was higher than in 1958 (see above, *Agriculture*). In other economic developments, the year's income from the tourist trade amounted to an estimated $500 million, and industrial expansion continued. One of the state's major new industrial plants, a $31 million Crown Zellerbach paper mill, began operations at St. Francisville.

Legislature and Principal Events by:
G. W. McGinty,
Professor of History; Head, Department of Social Sciences, Louisiana Polytechnic Institute.

LUMBER. Production of lumber in the United States in 1958 was below the previous year's level, according to reports of the National Lumber Manufacturers Association. The preliminary estimate for 1958 was 33,579 million board feet, and the revised estimate for 1957 was 34,214 million board feet.

United States lumber production in the first half of 1959 was 17,756 million board feet, a gain of 12% over the first half of 1958. An increase in housing starts during 1959 (see Housing) was expected to bring an upturn in lumber production for the entire year. (For information on wood pulp production, see Paper Industry.)

UNITED STATES LUMBER PRODUCTION, 1957–58
(In million board feet)

Region	1957	1958
Southern pine	6,724	6,892
Douglas fir	7,728	8,078
Western pine	8,014	8,081
California redwood	2,608	2,251
Other (softwoods)	1,684	1,699
Total softwoods	26,758	27,001
Southern hardwoods	3,770	3,326
Other hardwoods	3,686	3,252
Total hardwoods	7,456	6,578

Lumber output by principal producing regions for 1957 and 1958 is indicated in the accompanying table.

United States imports of lumber in 1958 totaled 3,392 million board feet, according to the U.S. Department of Commerce. The total comprised 3,155 million feet of softwood lumber, 235 million feet of hardwood, and 2 million feet of railroad ties. Softwood lumber from Canada accounted for most of the imports. Exports totaled 727 million board feet, comprising 540 million feet of softwood, 133 million feet of hardwood, 1 million feet of box shooks, and 53 million feet of sawn railroad ties.

The wholesale price index of lumber, according to the Bureau of Labor Statistics, dropped from an average of 119.7 for 1957 to 118.0 for 1958. By June 1959, however, the index had risen to 130.4, almost equaling the all-time high point of 130.6 reached in April 1956. In July 1959 the lumber price index tapered off slightly to 129.8 (1947–49 = 100).

The Department of Commerce reported 41,484 establishments in lumber and related products manufacture (excluding furniture). Expenditures for new plant and equipment in 1957 were $211 million, compared with $307 million in 1956. Employees numbered 646,000, including 579,000 classed as production workers. Man-hours worked by production workers totaled 1,072,000,000; wages $1,723,000,000.

Canada.—The Department of Northern Affairs and National Resources, Forestry Branch, issued a preliminary total of 6,805 million board feet for Canada's production of lumber in 1957. Estimated production in the preceding year was 7,830 million board feet. More than 90% of Canada's total lumber production is softwood lumber. Canada exported 3,646 million board feet of lumber in 1957. The United States and the United Kingdom were the largest customers. Canada's lumber imports in 1957 amounted to 237 million board feet.

World Production.—The Forestry Division of the Food and Agriculture Organization of the United Nations (FAO) reported the estimated world production of sawn wood in 1957 at 283,310,000 cubic meters (1 cubic meter = 424 board feet). This was a slight drop from the revised estimate for 1956 (294,025,000 cubic meters). Increased production in Asia, the Soviet Union, Central America, and Africa was more than offset by declines in North and South America, Europe, and the Pacific area.

The USSR became the world's leading producer of sawn wood in 1957. Its reported production of 79 million cubic meters topped that of the United States by about 200,000 cubic meters. Other large producers were Japan (23.1 million cubic meters), and Canada (15.8 million). Sweden, Poland, and France each produced more than 7 million cubic meters; and West Germany, 6.9 million.

Coniferous species accounted for approximately 80% of the total production of sawn lumber in 1957, and for 90% of exported volume. A review by FAO of general trends in the world trade of lumber showed that during the ten-year period ending in 1957 Europe changed from a net exporter to a net importer of sawn softwood, while the opposite development was reported for the USSR. Canada was the world's leading exporter, and the United States continued to be a net importer of lumber. (See also Forestry.)

LUTHERAN CHURCHES OF AMERICA. Membership in 1959 of the 16 Lutheran Church bodies in the

United States and Canada was reported at 8,090,000 by the National Lutheran Council, with 250,149 members in Canada.

On July 7, at Northfield, Minn., three Lutheran Church bodies—the 1,119,000-member Evangelical Lutheran Church, the 1,005,000-member American Lutheran Church, and the 67,000-member United Evangelical Lutheran Church—reached final agreement on terms of union. Also, board members and key administrators were elected for the new group, which will be known as The American Lutheran Church. A formal merger is scheduled to take place at a joint convention in Minneapolis, Minn., in April 1960.

After rapid progress in negotiations toward another merger, hope was expressed in 1959 that all documents may be ready by early 1960 for union between the 2,440,000-member United Lutheran Church in America (the largest Lutheran body in the United States), the 591,000-member Augustana Lutheran Church, the 40,000-member Suomi Synod, and the 23,000-member American Evangelical Lutheran Church. If the merging churches will approve the proposed constitution at their 1960 conventions, the new 3,000,000-member Church should begin functioning by late 1962.

The possibility of closer cooperation among divided Lutheran groups in America was evidenced by an announcement that the 2,315,000-member Lutheran Church–Missouri Synod will discuss future participation in the National Lutheran Council and in the Lutheran World Federation. The announcement, made at the synod's 44th triennial convention (June 17–26, 1959), followed an earlier refusal to discuss extended cooperation with the National Lutheran Council.

Also at the convention, which re-elected Dr. John W. Behnken president of the synod for a record ninth term, a Statement on Scripture was approved, reaffirming a literal approach to the Biblical revelation. This action marked a step toward complete doctrinal agreement with three smaller, conservative bodies cooperating in The Evangelical Lutheran Synodical Conference of North America.

Two member groups of this conference changed their names during 1959. The 347,000-member Evangelical Lutheran Joint Synod of Wisconsin and Other States became The Wisconsin Evangelical Lutheran Synod. The 20,000-member Slovak Evangelical Lutheran Church became The Synod of Evangelical Lutheran Churches. The 9,500-member National Evangelical Lutheran Church was invited to merge with the Missouri Synod.

Overseas shipments by Lutheran World Relief, Inc., of food, clothing, and medicines for refugees and needy people passed the $100,000,000 mark by mid-1959. This agency, founded in 1946 as a material aid arm of the National Lutheran Council, also receives support from the Missouri Synod.

ALEX LIEPA,
Editor, "The National Lutheran."

LUXEMBOURG. A grand duchy of western Europe, bounded by Belgium, France, and Germany. Area, 998 square miles; pop. (est. 1958), 321,858. The capital and chief city is Luxembourg (70,158). French and Letzeburgesch, a German-French-Dutch admixture, are the principal languages.

Government.—Grand Duchess Charlotte (b. 1896; acceded 1919) is the sovereign. The Chamber of Deputies consists of 52 members elected by universal suffrage for a 5-year term. Party seating following the elections of Feb. 1, 1959, was: Christian Social (Roman Catholic), 21; Socialists, 17; Democrats (Liberals), 11; and Communists, 3. The Council of State, consisting of 15 members appointed for life by the sovereign, may exercise a temporary suspensive veto on legislation. Pierre Werner (Christian Social) heads a Christian Social–Democratic coalition cabinet formed on Feb. 26, 1959.

Education and Religion.—In 1957–58 there were 28,850 pupils in primary schools and 7,427 students in higher elementary, commercial, technical, and other secondary schools and colleges. The majority of the population is Roman Catholic.

Finance.—The estimated budget for 1958 (ordinary and extraordinary) was: revenue, 4,997.7 million francs; expenditure, 5,080.9 million. The consolidated debt in September 1958 included 4,188.3 million francs of long-term debt and 3,144.5 million of short-term. The Luxembourg franc equals U.S.$0.02.

Transportation and Communications.—The road network in 1958 included 1,733 miles of state roads and 1,240 miles of local roads. Railways total 244 miles. Passenger cars numbered 28,862 in 1958; telephones, 38,420; television sets, 1,600 (December 1957); daily newspapers, 5 (total circulation, 1957: 137,000).

Production.—Luxembourg's iron and steel industry accounts for about 55% of industrial employment, provides some 70% of industrial output value, and contributes about 90% of exports. Crude steel production in 1958 totaled 3,378,820 metric tons (down 3% from the record 1957 figure); pig iron and ferroalloys, 3,285,355 (down 2.5%); and iron ore, 6,637,998 (down 9%). Other manufactures are shoe leather, gloves, cement, rubber products, china, and textiles. The index of industrial production (1953 = 100) fell about 4% to 121 in 1958, but recovered somewhat to 123 in the first half of 1959. Agriculture engages about a fourth of the economically active population. Chief products are wheat, rye, oats, barley, potatoes, dairy products, and wine. National income in 1958 was estimated at 16 billion francs, down about 5.3% from 1957. Luxembourg has had an economic union with Belgium since 1922.

Principal Events, 1959.—The cabinet crisis of December 1958, resulting from the Socialists' withdrawal from the coalition government of Premier Pierre Frieden over charges of bribery against a Socialist minister, was resolved following the national elections of Feb. 1, 1959. The elections resulted in a gain of five seats for the Democrats and an equivalent loss for the Christian Socials. The Socialist and Communist seating remained unchanged. Pierre Werner formed a Christian Social–Democratic coalition government on February 26, succeeding the caretaker government of Frieden (who died in Zurich, Switzerland, on February 23). Eugène Schaus was named minister of foreign affairs and defense minister.

Under an agreement signed with West Germany on July 11 settling certain problems arising out of World War II, Luxembourg returned to West Germany some 1,200 acres of land in the Kammerwald border area.

McELROY, Neil Hosler, former U.S. secretary of defense (succeeded on Dec. 1, 1959, by Thomas S. Gates, Jr.). (See GATES and the Index entry, *McElroy.*)

MACHINE TOOLS. Machine tools, the power-driven machines that cut and shape metal, are required directly or indirectly for the manufacture and the delivery to the user of practically every product known today.

Although the industry is therefore a basic industry, it is small by comparison with other industries. In the United States it comprises about 300 companies located chiefly north of the Ohio and Potomac rivers, and east of the Mississippi, with a few as far west as California. A few machine tool companies employ as high as 5,000 men, but the average machine tool builder has normally from 200 to 250 employees.

In 1959 the industry was recovering from the economic recession in the capital goods field which began in 1957 and continued through 1958. The trend since the beginning of 1959 has been slowly upward. Comparative shipments of cutting and forming types of machine tools in the years 1957–59 were as follows: 1957, $1,088,450,000; 1958, $519,900,000; and 1959 (estimated), $525,000,000. In 1957 exports accounted for 11% of the total; in 1958, 14%. It was expected that the percentage in 1959 would be much the same as in 1958.

The United States government now recognizes over 500 types of machine tools, aside from the number of sizes in each type, and their various combinations. In size, machine tools range from that of a small desk to that of a house; and in cost, from less than a thousand dollars to over a million.

During the recent recession in the industry—while uncertain conditions led manufacturers in the metalworking field to postpone modernization—the machine tool industry concentrated its efforts on research and product development in order that it would have new and better models available to stimulate buying as general business conditions improved. Such efforts have been accelerating, looking forward to The Machine Tool Exposition—1960, to be held in Chicago in September, at which new models of American-built machine tools will be on display.

Recent advances in machine tool product development have included the following:

(1) Increased metal cutting and forming capacity. The machines being developed today are, in the main, larger, more rugged, and capable of doing more work in less time.

(2) Advances in accuracy. Throughout industry the trend has been toward closer tolerances, with some specifications calling for accuracy within millionths of an inch. Remarkable advances are being made in this direction.

(3) Improvements in electrical, mechanical and hydraulic controls. The trend toward automatic operation is accelerating rapidly. By this means the production pace is built into the machine; it is not subject to the skill or the working pace of the operator. At the same time, the required accuracy is assured.

(4) The application of numerical controls. These devices, by which the desired operation of the machine is determined in advance, and performance is automatic, are finding more and more applications.

(5) The use of profiling machines, templates, and other devices, which enable a machine to perform a repetitive pattern, duplicating the work piece desired.

(6) The development of automatic loading and unloading devices, and devices for moving work pieces from one machine to the next, eliminating hand operations.

(7) The production of machine tools for the machining of new materials, particularly extremely hard materials required for the manufacture of missiles and other special purposes.

(8) The development of entirely new machining methods, such as electrolytic machining and ultrasonic machining.

It is generally accepted that the major share of the machine tools in the metalworking plants of the United States are obsolete by comparison with models being developed today. The need for modernization is universally recognized. How rapidly this will be reflected, however, in machine tool sales will depend on the willingness of metalworking companies to make the necessary capital expenditures. This, in turn, is affected by the general business outlook and the degree of confidence with which industries can look forward to the future.

Another factor having a bearing on the expansion of the industry is the national defense program. Machine tools are essential to the making of practically every military item; but the number of machine tools needed varies with the nature of the defense items to be produced, and the volume of defense procurement.

Sheer economic necessity and the pressure of price competition, both domestic and from abroad, must inevitably push metalworking concerns into modernization programs. It would appear probable, therefore, that the present upturn in machine tool sales and operations will continue, the only uncertainty being the rate at which this improvement will materialize.

LUDLOW KING,
Executive Vice President,
National Machine Tool Builders' Association.

MACHINERY. See Index entry.

MacLEISH, Archibald, American poet: b. Glencoe, Ill., May 7, 1892. Twice winner of the Pulitzer Prize for poetry—in 1933 for his long narrative poem *Conquistador* and in 1953 for *Collected Poems, 1917–1952*—Archibald MacLeish received the 1959 Pulitzer Prize for drama (announced May 4) for his verse play *J.B.* Opening on Broadway on Dec. 11, 1958, to general critical acclaim (it had been presented first at Yale University in April 1958), *J.B.* is a restatement in 20th century terms of the Book of Job.

After attending Hotchkiss School, Lakeville, Conn., and Yale University (B.A., 1915), Archibald MacLeish became a law student at Harvard University. His legal training was interrupted by service in the U.S. Army during World War I, following which he returned to Harvard and completed his studies in 1919. He spent a brief period there as a law instructor, and then practiced privately until 1923, when he began to devote himself fully to writing. From that year until 1928 he lived abroad, mostly in France. While in Europe, MacLeish published *The Happy Marriage* (1924), *The Pot of Earth* (1925), *Streets in the Moon* (1926), and *The Hamlet of A. MacLeish* (1928), which, like the earlier *Tower of Ivory* (1917), are highly subjective and reflect the poet's indebtedness to T. S. Eliot and Ezra Pound.

After MacLeish's return to the United States in 1928, he became less subjective and more aware of his national cultural heritage. This period, continuing until about the publication of *Poems, 1923–*

1933 (1933), saw the appearance of *New Found Land* (1930), *Conquistador* (1932), and *Frescoes for Mr. Rockefeller's City* (1933).

In 1935, with the appearance of *Panic*, a verse drama, MacLeish exhibited a markedly increased awareness of contemporary social issues. *The Fall of the City* (1937) and *Air Raid* (1938), both plays in verse, and *The Irresponsibles* (1940), *The American Cause* (1941), *A Time to Speak* (1941), *A Time to Act* (1943), and *The American Story* (1944), all in prose, further reflected the author's concern with the economic crisis of the 1930's and, more especially, with the rise of totalitarianism and its threat to American democracy. His post-World War II volumes of poetry include *Actfive* (1948) and *Songs for Eve* (1954).

In 1938 he was appointed custodian of the Nieman Collection at Harvard, and a year later President Roosevelt named him librarian of Congress, which post he held until his appointment as assistant secretary of state for public and cultural relations (1944–45). In addition, during World War II he was director of the U.S. Office of Facts and Figures (1941–42) and assistant director of the Office of War Information (1942–43). He also held various posts in connection with the U.N. Educational, Scientific and Cultural Organization (UNESCO). In 1949 he became Boylston professor of rhetoric and oratory at Harvard.

MACMILLAN, (Maurice) Harold, prime minister of Great Britain: b. London, England, Feb. 10, 1894. Great Britain's rising fortunes during 1959, internally and internationally, were in good part due to the effectiveness of her prime minister, whose personal fortunes were crowned with a triumphant re-election in October.

Educated at Eton and at Balliol College, Oxford (B.A. 1919), he was a director of Macmillan and Company, Ltd. (1920–40) and a Conservative member of Parliament (1924–29; 1931–45). He served in the postwar Conservative government as minister of housing and local government (1951–54), minister of defense (1954–55), secretary of state for foreign affairs (1955), and chancellor of the exchequer (1955–57) before succeeding Sir Anthony Eden as prime minister on Jan. 10, 1957.

Macmillan pressed more actively than any other Western head of state during 1959 for negotiations with the Soviet Union and exploration of new means of coexistence with the Communists. On February 21 (two days after signing the agreements for a settlement on Cyprus, q.v.) he flew to the Soviet Union for a ten-day visit to explore the possibility of an East-West meeting on the problem of Germany (q.v.) and West Berlin. The prime minister reported his findings, in visits during March, to President de Gaulle in Paris, Chancellor Adenauer in Bonn, and President Eisenhower in Washington, D.C. Finally, after a meeting of the four leaders in Paris (December 19–21), an invitation to Soviet Premier Khrushchev was issued and accepted for a Big Four summit meeting to begin in Paris on May 16, 1960. (See also SUMMIT CONFERENCE.)

Prime Minister Macmillan (l.) and his guest, French Premier Debré, visiting London, April 14, admire cherry blossoms in the garden of Macmillan's residence, 10 Downing Street.

WIDE WORLD

Domestically, under Macmillan's leadership in 1959, Britain's economy improved as, for example, the country's production and export trade rose steadily. The prime minister's prestige was high in the general election of Oct. 8, 1959, when the Conservative Party nearly doubled its majority in the House of Commons and set precedent by being the only British party in the 20th century to win three successive elections with increased majorities. Macmillan himself was re-elected by his own constituency (Bromley) by the largest plurality in his career.

(See also GREAT BRITAIN.)

MADAGASCAR. See MALGACHE REPUBLIC.

MADEIRA. A group of Atlantic islands about 535 miles southwest of Lisbon, forming the Funchal District of Portugal. Area, 305 square miles; pop. (1950), 269,769. The capital is Funchal (37,215). Madeira (286 sq. mi.), a noted health resort, and Porto Santo (16 sq. mi.) are the only inhabited islands. Oranges, grapes, bananas, and sugarcane are grown. Industries include fishing, wine making, and handicrafts.

MAGAZINES. Despite continued cost increases, the magazine industry registered an increase in profits from about 2% in 1958 to nearly 3% in 1959, and most publishers felt confident that 1960 would be at least as good a year.

The increase in profits was due both to strict industrywide cost controls and to better business conditions. Advertising revenue for the year 1959 was estimated at $780 million, compared with $696,265,655 in 1958 and $741,434,426 in 1957. The number of advertising pages sold in the first nine months of 1959 was up 5.7% over the comparable 1958 period, and the year's total was estimated at 73,000, compared with 72,256 pages in 1958, according to the Magazine Advertising Bureau.

Circulation of general and farm magazines reversed a slight downward trend, with 269 magazines distributing 182,310,061 copies per month in the first six months of 1959, compared with 278 publications with a monthly circulation of 180,997,478 copies in the first half of 1958.

The industry in 1959 stepped up its efforts, particularly in competition with television, to gain a larger share of the advertising dollar. A survey by the National Consumer Panel of the Market Research Corp. of America, made through "diary reports" from 5,800 households, reported in part "a buying rate which increases in almost direct proportion with magazine exposure to household heads."

Beyond the normal business competition for advertising revenue, the Magazine Publishers Association continued during the year to urge concerted action against what it considered serious threats to magazine circulation and advertising by various federal and local government activities, including increased postal rates.

Canadian Developments.—In general, business developments in Canadian magazine publishing in 1959 were much the same as in the United States, with advertising revenues and circulation con-

tinuing to increase. The one circulation exception was *Macleans* magazine, which took the nearly unprecedented step of moving to reduce both circulation and circulation guarantees. The policy behind the move was reported as one of not going all-out for circulation for its own sake, but of giving added importance to readership quality.

Business Publications.—Advertising and circulation indices of business publications generally showed increases in 1959, according to an annual study by Angelo R. Venezian, vice president of McGraw-Hill Publishing Co., and his forecasts for 1960 were optimistic. Advertising pages published in 1959, the Venezian study showed, totaled approximately 1,183,000, some 2,000 over 1958, and appeared headed for a 1960 level of some 1,220,000 pages. He estimated advertising revenue, exclusive of production costs, at $503,500,000 for 1959, with a 1960 volume predicted at $550 million. Circulation also continued to grow, with the 1959 average monthly distribution estimated at 43.1 million, compared with about 41 million in 1958.

As with other types of publications, increased efficiency in the management of business magazines will be necessary, for Venezian estimated that by 1961 costs will be up 6% for printing, 5% for paper, 20% for postage, and 10–15% for wages.

New Publications.—Despite the greater capital needed to start a magazine, the year 1959 saw the birth of some 53 new publications, compared with 41 in 1958, with business magazines again leading general publications by about 2 to 1.

Among new consumer publications were: *Air Travel; Best Articles and Stories; Direction, The Dial,* and *Noonday,* all by book publishers; *Echo* and *Living Music,* phonograph record magazines; *Ingénue; Jazz; Leisure; Overview; Power Boating Quarterly; Save* (premiums and contests); *Ski Life; U.S. Amateur Hockey; Western Family Outlook;* and *World Farming.*

Entering the business field were: *Advertising Contact; Agricultural Banker; Agricultural Equipment Dealer* (in tabloid format); *Air Engineering; Builder's Kitchen Guide; Carpenter and Joiner; Construction Machinery Distribution; Convention Planning; Coupon; Effective Marketing Action; Environment; Empire; Feedlot; Food and Drug Packaging; Graphic Arts Buyer Of Chicagoland; Great Lakes Seaway Journal; Ground Support Equipment; Imported Auto Trade; Industrial Research; Industrial Supplier and Distribution News; Irrigation Farmer and Water Management; Irrigation Dealer and Well Driller; Journal of Chemical and Engineering Data; Magazine of Urban/Rural Planning; Management and Business Automation; Midwest Port; National Real Estate Investor; Nursing Home Management; Power Drive Engineering; Power Transmission Design; Salesweek; Scientific Research;* and *Stereo Hi-Fi Retailing.*

Mergers and Transfers.—During the year, Hearst Corporation bought *Popular Mechanics;* Conover-Mast Publications, Inc., acquired *Boating Industry* and *Electrical Manufacturing;* and American Aviation Publications, Inc., purchased *Garden Supply Merchandiser.* Mergers included Street & Smith Publications, Inc., with Condé Nast Publications, Inc., and Cahners Publications with Industrial Publications, bringing the new house total to 14 business publications in the building and materials handling fields.

(See also CENSORSHIP and the Index entry, *Magazines.*)

JOHN FOSTER, JR.,
Professor, Graduate School of Journalism, Columbia University.

MAGNESIUM. In 1958, world production of magnesium metal declined to 101,000 short tons or 34% below that in 1957, according to U.S. Bureau of Mines data. It was the lowest output since 1951. (See MINERAL PRODUCTION for table showing output by major producing countries.) The United States reported 30% of this total, compared with 52% in 1957. Therefore, the decrease in world production resulted chiefly because of curtailed United States output. Domestic output of primary magnesium was 30,096 short tons; stocks had accumulated beyond average annual consumption. In 1958, domestic consumption of the metal was 17% above production. The Dow Chemical Company closed its plant at Velasco, Texas, on March 1, 1958, but produced magnesium at its Freeport plant throughout the year. The government-owned silico-thermic plant at Canaan, Conn., continued to produce magnesium and calcium. In the first nine months of 1959, domestic production of primary magnesium totaled 21,444 tons. In the first eight months of 1959, imports of magnesium totaled 477 tons and exports totaled 1,247 tons.

MAGNETISM, Terrestrial. See the Index entry, *Terrestrial Magnetism and Electricity.*

MAIL SERVICE. See POST OFFICE DEPARTMENT.

MAINE. New England State, United States; admitted to the Union, March 15, 1820. The "Pine Tree State" ranks 39th in area and 36th in population among the 50 states.

Area and Population.—Area: 33,215 square miles (land, 31,040; inland water, 2,175), divided into 16 counties. Population: (1950) 913,774; (est., July 1, 1958) 944,000. Urban places with 1950 populations above 10,000 are:

Auburn	23,134	Portland	77,634
Augusta (*capital*)	20,913	Saco	10,324
Bangor	31,558	Sanford town*	15,177
Bath	10,664	South Portland	21,866
Biddeford	20,836	Waterville	18,287
Brunswick town*	10,996	Westbrook	12,284
Lewiston	40,974		

* Civil division.

Executive.—Chief state officers in 1959:
Governor: Clinton A. Clauson, Democrat (died December 30; succeeded by John Reed, Republican, president of the Senate)
Secretary of State: Harold I. Goss
Treasurer: Frank S. Carpenter
Attorney General: Frank E. Hancock
Auditor: Michael A. Napolitano
Commissioner of Education: Warren G. Hill

Constitution and Judiciary.—The present constitution went into effect in 1820, and was most recently codified in 1951. The highest tribunal, the Supreme Judicial Court, comprises six justices; chief justice in 1959 was Robert B. Williamson.

Legislature.—The Maine Legislature comprises a 33-member Senate (in 1959, 21 Republicans and 12 Democrats) and a 151-member House of Representatives (93 Republicans and 58 Democrats). It convened in 1959 for its 99th regular session on the first Wednesday of January, which fell on the 7th of the month, and adjourned on June 14 after the longest session in its history. The length of the session was due chiefly to a prolonged battle over tax measures to finance a budget which, after some cutting, was larger than anticipated revenues. Tax measures proposed by Democratic Gov. Clinton A. Clauson were defeated, and the budget was balanced by enactment of a Republican proposal to tax hotel and motel rentals. General Fund expenditures of $104 million and highway costs of $77 million were charged to current revenues for the 1959–61 biennium, while $3.9 million in bond issues for highways and building construction (chiefly at teachers colleges and the state university) were approved by the legislature and accepted by the voters at a referendum election on October 12.

Two studies were financed by the legislature—one on state and local taxation problems of Maine, and the other dealing with the lower courts of the state. Other legislative acts included a "right to know" law, the state's first minimum-wage act, a revision of juvenile offender laws, and a measure punishing acts of discrimination in "public accommodation" by reason of "race, color, religious creed, ancestry or national origin."

Finance.—In the 1959–60 fiscal year, state revenue of $130,929,388.57 comprised $77,322,516.20 from state tax sources, $37,473,345.59 from the federal government, and

WIDE WORLD

Maine's Governor Clauson (l.), who died on December 30, was succeeded by John Reed (r.), president of state Senate.

$16,133,526.78 from other sources. Tax revenue consisted of $24,482,180.41 from a 3% general sales tax, $22,241,686.12 from motor fuel taxes, $10,502,929.34 from licensing, and $20,095,720.33 from other sources. Expenditures of $127,891,737.15 comprised $18,260,475.81 for education, $24,534,947.05 for health, welfare, and safety, $52,589,912.10 for highways, and $32,506,402.19 for other purposes. Long-term indebtedness on June 20, 1959, amounted to $37,190,000.

Banking.—As of June 10, 1959, the state's 29 national banks had $342,548,000 in assets, $181,114,000 in demand deposits, and $122,846,000 in time deposits. The 57 state banks (June 30, 1959) had assets of $803,824,000, time deposits of $546,819,000, and demand deposits of $166,940,000.

Education.—School attendance is compulsory between the ages of 6 and 17, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $39,093,703 ($231.24 per pupil), and revenue comprised $34,185,030 from local school districts, $12,567,027 from the state, and $1,743,319 from the federal government. Outlays for construction and improvements amounted to $3,986,073, and teachers' salaries averaged $3,579 (high school, $4,110; elementary, $3,352).

MAINE SCHOOL STATISTICS, 1957–58

Type of school	No.	Teachers	Students
Public elementary (k-8)	1,050	5,309	143,490
Public junior & senior high (7–12)	183	2,273	40,736
Parochial elementary & high schools	85	837	26,310
Private academies & institutes	35	411	6,913
Vocational & special schools	1	17	274
Teachers colleges	5*	148	1,418
Colleges and universities	4	524	6,825

* Includes 1 normal school.

Social Welfare.—In the 1958–59 fiscal year, public assistance expenditures from federal and state funds (excluding institutional costs) totaled $15,886,072, including $8,180,472 for the aged, $6,130,766 for dependent children, and $1,235,651 for the permanently and totally disabled. A monthly average of 32,535 persons received public assistance. State expenditures for mental health activities amounted to $6,439,257; for correctional and penal programs, $1,740,026.

Labor Force.—The state's labor force on Aug. 15, 1959, totaled 397,100, including 42,100 agricultural workers. Nonfarm employment of 339,100 was up slightly from 332,300 a year earlier, more substantially above the average of 319,300 for the intervening 12 months. Of all nonfarm employees in August 1959, 32.2% were in manufacturing, 16.1% in trade, and 13.1% in government. Unemployment dropped sharply in August 1959 to 15,900 from 26,400 in the previous August. The state paid $19,838,870 in unemployment compensation during 1958.

Manufacturing.—The state's 2,387 manufacturing plants in 1958 employed 100,874 persons who received $369,175,413 in wages. Value of production amounted to $1,343,655,606, and investment in new plant and equipment totaled $39.5 million. Production workers averaged $69.49 for an average workweek of 40.4 hours during August 1959.

MAJOR MAINE MANUFACTURES, 1958

Product or industry	Employees	Gross wages	Value of product
Paper and allied products	16,716	$83,577,522	$363,825,317
Food and kindred products	11,366	34,362,604	247,929,056
Leather & leather products	20,817	59,241,680	196,985,831
Textile mill products	13,651	40,745,055	161,682,355
Lumber and wood products (except furniture)	11,869	35,480,433	109,574,771
Transportation equipment*	12,530	65,620,077	90,032,712
Fabricated metal products	1,718	7,375,828	34,241,782

* Includes Kittery Naval Shipyard, except for value of product. (Source: Maine Department of Labor and Industry.)

Mining.—In 1958 Maine ranked 46th among the states in the value of its mineral output, with 0.08% of the national total. Production was principally of construction materials.

MAINE MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Clays	23,000	$ 26,000
Feldspar (long tons)	13,034	83,000
Mica, sheet	10	278,000
Sand and gravel	8,941,000	3,746,000
Stone	880,000	2,760,000
Other minerals	...	6,371,000
Total	...	$12,574,000*

* Total adjusted to eliminate duplication in value of raw materials used in the manufacture of cement. (Source: U.S. Bureau of Mines.)

Fisheries.—Commercial fish and shellfish landings in Maine ports during 1958 totaled 316,954,664 pounds valued at $19,024,410, up 8% in volume and 13% in value over 1957 totals. Principal species were: lobster (21,312,000 pounds valued at $10,445,004), ocean perch (71,067,781; $3,002,566), and sea herring (170,977,322; $2,562,805).

Agriculture.—Cash farm income for the first nine months of 1959 dropped sharply to $129,172,000 from $169,777,000 for the corresponding period of 1958. For the full year 1958, income comprised $121,338,000 from livestock and livestock products, $87,209,000 from crops, and $1,688,000 from government payments. Principal income sources in 1958 were potatoes, $67,403,000; broilers, $41,633,000; dairy products, $33,767,000; and eggs, $31,302,000.

MAINE CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	1,000	1,250	1,430
Hay (1,000 tons)	694	615	599
Maple sirup (1,000 gal.)	18	15	15
Oats (1,000 bu.)	3,454	3,015	3,337
Potatoes (1,000 cwt.)	35,390*	37,250	34,606

* Average, 1949–57. (Source: U.S. Department of Agriculture.)

There were 22,800 farms in the state in 1958. Total acreage (1954) of 3,614,000 included 796,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 192,000 cattle and 3,950,000 chickens (excluding commercial broilers). A monthly average of 50,000 persons was employed in agriculture during 1958.

Transportation and Communications.—State and federal funds spent for highways in 1958 totaled

$52,076,944, and 331 miles of new construction were completed.

Highways and roads on March 1, 1959, totaled 20,761 miles (17,130 surfaced). Registered *motor vehicles* numbered 356,830 on Dec. 31, 1958, including 282,011 passenger cars. There were (1958) 9 *railroads* operating 1,929 line miles and (1959) 1 regularly scheduled *airline* and 151 *airports and airfields* (27 commercial and municipal, 4 military, and 54 private; also 17 commercial and 49 private seaplane bases).

Communications media (1958) included 24 AM and 2 FM *radio stations;* 6 VHF *television stations;* 9 daily *newspapers* (circulation, 240,021) and 54 other newspapers (242,106); and (Jan. 1, 1959) 76,900 business and 212,500 residential *telephones.*

Principal Events, 1959.—Democrat Clinton A. Clauson, who in 1959 became Maine's first four-year governor as the constitutional amendment abolishing the two-year term went into effect, died at Augusta on December 30.[1] His year in office had been marked by conflict with the Republican-controlled legislature and the all-Republican seven-man Executive Council. The governor's appointive power is limited by the confirmation power of the majority of the council, and in 1959 the governor's nominees for several top positions were rejected and vacancies remained unfilled for months. A proposed amendment to the Maine Constitution which would have eliminated the council was defeated in the 1959 legislature.

A controversial matter since it was first suggested in 1919, the proposed Passamaquoddy Bay tidal project was in the headlines again in 1959 when a three-year report was released indicating that the project was "economically feasible." Product of a joint American-Canadian board, the October 16 report states that a dependable yield of 550,000 kilowatts of electricity could be expected. The International Joint Commission will next decide whether to recommend construction.

As 1959 neared its end, the fate of steam railway passenger service in Maine was still unsettled. Pending before the state Public Utilities Commission was a request from Maine railroads to drop passenger car service. After protracted public hearings it was obvious that the railroads were losing money. It was not clear whether, if rail passenger service was abandoned, the improvement of freight service would sufficiently offset the inconvenience caused the traveling public.

In May 1959 the Maine Supreme Court ruled that no state law allowed local governments to spend tax money to transport pupils to private (chiefly parochial) schools. At the year's end the problem was still unsettled, since the legislature had not acted. Because of this matter and another educational tangle caused by the unwillingness of banks to lend money to two school districts whose legality was questioned, Governor Clauson had announced that there would be a special session of the legislature in January 1960. It would be asked to authorize transportation of parochial school children by public school buses, and to validate the two questioned school districts so that they might borrow money to build schools.

The economic picture in Maine in 1959 was considerably brighter than in 1958, with greater employment, a larger tourist business, and gains in various industries, including lumber and wood products, leather products, and textiles. The only large segment failing to gain was agriculture.

Legislature and Principal Events by:
EDWARD F. DOW,
Head, Department of History and Government, University of Maine.

[1] Clinton Amos Clauson (64), Iowa-born, set up a chiropractic office in Waterville, Me., following military service in World War I. He entered politics in 1923, and continued active as a Democrat. From 1934 until 1953 he served as U.S. collector of internal revenue for Maine, meanwhile active as a chiropractor until 1938. He served as mayor of Waterville in 1956 and 1957, and the following year, capitalizing in part on his immense personal popularity, he defeated a party-picked candidate for governor in the June primary. Helped by the tremendous popularity of his gubernatorial predecessor, Edmund S. Muskie, who was running for the U.S. Senate, he won out over former Gov. Horace A. Hildreth in the November 1958 election.

MALAGASH REPUBLIC. See MALGACHE REPUBLIC.

MALAYA, Federation of. This British federated territory in Southeast Asia, comprising nine Malay states and the former British settlements of Penang and Malacca, was constituted a fully self-governing independent nation on Aug. 31, 1957. It retained its ties with Great Britain as the 11th sovereign member of the Commonwealth of Nations, and is the only member to have a constitutional elective monarchy. Aggregating 50,680 square miles in area, it occupies the whole of the Malay Peninsula, south of which the Johore Strait separates the federation from Singapore (q.v.). The federal capital is Kuala Lumpur (pop. est., 316,230).

The federation's estimated population (1958) is 6,515,000. Its multiracial distribution (1957 census) comprises 3,126,706 Malaysians, 2,332,936 Chinese, 695,985 Indians, and 123,136 others. At the time independence was granted, the component states and their areas, populations, and capital cities were as follows:

FEDERATION OF MALAYA

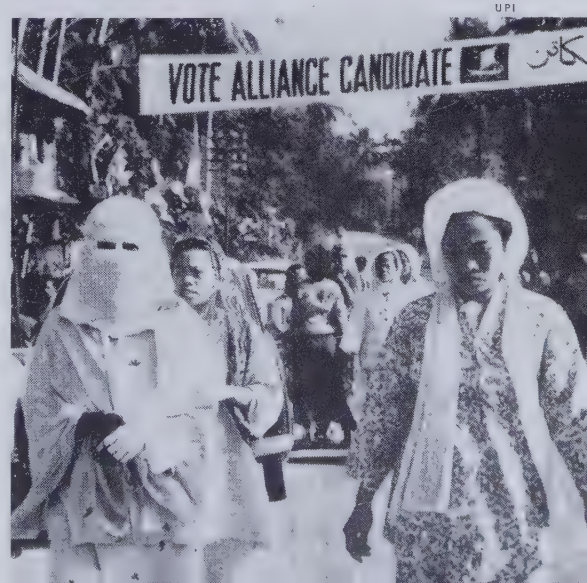
State	Area (sq. mi.)	Pop. (1957)	Capital
Perak	7,980	1,221,390	Ipoh
Selangor	3,160	1,012,891	Kuala Lumpur
Negri Sembilan	2,580	364,331	Seremban
Pahang[1]	13,820	312,949	Kuantan
Johore	7,330	927,565	Johore Bahru
Kedah[2]	3,660	701,643	Alor Star
Kelantan	5,750	505,585	Kota Bahru
Perlis	310	90,866	Kangar
Trengganu	5,050	278,165	Kuala Trengganu
Penang[3]	400	572,132	George Town
Malacca	640	291,246	Malacca
Total	50,680	6,278,763	

[1] Includes Tioman Island in South China Sea. [2] Includes Langkawi and adjoining islands. [3] Penang State comprises Penang Island (110 square miles) and Province Wellesley (290 square miles).

Government.—The Malayan constitution provides for a paramount ruler (Yang di-Pertuan Agong) who is elected for a five-year term by nine Malay rulers from among

Malayan women, including a veiled Moslem, walk to the polls in Kuala Lumpur on August 19, in the Federation of Malaya's first general elections since gaining self-government.

UPI



their number. Tuanku Sir Abdul Rahman, ruler of Negri Sembilan, was chosen the first such head of state and was formally installed with the title of "king and ruler of the Federation of Malaya" at Kuala Lumpur on Sept. 2, 1957. Owing to illness he was succeeded on Sept. 26, 1959, by an acting chief of state, the sultan of Selangor. The paramount ruler is advised by a cabinet headed by a prime minister. Tengu (Prince) Abdul Rahman has served in this post since Malayan independence, except for a brief period (April 16–August 21) in 1959, when the prime minister was Dato Abdul Razak bih Dato Hussein. (Though bearing the same name, the prime minister is not related to the former ruler.)

The legislature comprises a Senate (Dewan Negara), consisting of 22 elected members (2 from each state) and 16 appointed members; and a House of Representatives (Dewan Ra'ayat), consisting initially of 104 elected members. Residual legislative power remains with the individual states, in which there are executive councils, state legislative assemblies, and numerous local authorities, including 286 elected local councils.

Finance and Development.—Actual expenditure for 1958 was M$848,763,389 and revenue totaled M$762,946,972, leaving a deficit of M$85,816,417 for the year. (The Malayan dollar equals 32.667 U.S. cents.) Budget estimates for 1959 indicated an expenditure of M$873,762,602, revenue of M$759,798,615, and a deficit of M$113,963,987. To increase the tax yield by M$36 million, the government proposed a new export duty on rubber planting materials, and increases in the rate of the company tax and in the duty on gasoline.

As a result of diminished revenue from tin exports the government reduced capital expenditure for 1959 under the five-year (1956–60), M$1,358 million development plan. The revised amount of M$152 million, or M$16 million less than budgeted, was to be distributed as follows: economic sector, M$110 million; social sector, M$28 million; armed forces, M$8 million; and public administration, M$6 million.

The federation is a member of the World Bank, which on Sept. 22, 1958, granted Malaya a loan equivalent to $35,600,000 toward a $51,200,000 hydroelectric power project in the Cameron Highlands. In July 1958 the U.S. Development Loan Fund announced a $10 million, 30-year loan for the development of new port facilities in North Klang Straits, near Kuala Lumpur, and in March 1959 granted a second $10 million loan toward the construction and rehabilitation of roads and bridges. Another $33 million was lent on Nov. 19, 1958, by the sultan of Brunei for road and land development. Total aid given and promised by the United Kingdom since the period just before independence has been over £33 million (see also below, *Principal Events, 1959*).

Education.—Schools numbered 5,366 in January 1959 (pupils, 1,229,855; teachers, 41,617), comprising 843 English, 2,249 Malay, 1,417 Chinese, and 857 Indian schools. Vocational training is given in 2 junior technical trade schools and 6 rural trade schools, and there are 2 technical institutes. Postsecondary professional education is given at the Technical College, Kuala Lumpur; the College of Agriculture, Serdang; and the University of Malaya, which in 1959 was building a new campus at Kuala Lumpur. Teacher training is furnished at local centers and colleges and at institutions in England.

Transportation and Communications.—In 1958 the government-owned Malayan Railway operated 1,028 route miles of track, including a main line running from Singapore to Prai via Kuala Lumpur, and branches extending to the border of Thailand and to the federation's principal ports. Some 6,780 miles of roads (5,309 miles metalled surface) are maintained by the Public Works Department. A total of 138,546 motor vehicles were registered in 1958. Internal air services are maintained by Federation Air Service (FAS), using 8 airports and 36 additional airfields, and by Malayan Airways Ltd. (owned by the British Overseas Airways Corporation), which also operates services to the principal towns of British Borneo, Indonesia, Thailand, and Hong Kong. Kuala Lumpur is served by BOAC and 6 other international airlines.

Production.—The economy is diversified by forestry, fisheries, and a prosperous agriculture, but is based principally on rubber and tin. Tin production in Malaya, the world's largest producer, was severely curtailed in 1958 by export controls imposed by the International Tin Council. The number of Malayan mines in operation fell from 738 at the end of 1957 to 417 in December 1958, and 13,000 miners were idled. Production of tin concentrates in 1958 amounted to 38,458 long tons, compared with 59,293 long tons in 1957.

The rubber yield in 1958 totaled 664,000 tons (638,000 tons in 1957), of which 391,000 tons (59%) were grown on estates and 273,000 tons by smallholders.

Reserved forests cover 24% of the country. Production of sawn timber in 1958 totaled 58 million cubic feet; over 8 million cubic feet were exported from the federation and Singapore.

Gold production, averaging 18,882 troy ounces during six previous years, increased to 22,484 ounces in 1958. Other mineral production in that year included bauxite (262,354 tons), coal (66,452 tons, compared with 152,711 tons in 1957), ilmenite, columbite, and china clay (kaolin, 1,200 tons). Iron ore output in 1958 was 2,795,261 tons, compared with 2,972,359 tons in 1957.

Other primary production in 1958 included fishery products, 112,100 long tons; copra, 108,000 tons; palm oil, 69,273 tons; tea, 4,878,000 pounds; paddy (1958–59), 696,000 tons; and milled rice (1957–58), 495,000 tons.

Industrial production in 1958 included 108,327 long tons of cement, 11,644,572 pairs of rubber footwear, and 10,608,000 gallons of soft drinks. More than 100 factories produced cigars, cigarettes, and pipe tobacco. Other manufactures included furniture, paper, and soap.

Electric power generation declined from 1,069,300,000 kw.-hr. in 1957 to 893,200,000 kw.-hr. in 1958, of which the tin industry used slightly less than half.

External Trade.—A favorable trade balance was recorded in 1958 in spite of the curtailment of tin exports, which yielded M$236,558,545, compared with M$439,400,000 in 1957. Total exports were M$1,882,866,061 (in 1957, M$2,179,500,000), to which rubber contributed M$1,196,313,300. Other important exports in 1958 were iron ore (M$62,540,093), coconut oil (M$40,549,307), palm oil (M$47,385,786), and timber (M$31,768,501). Imports totaling M$1,656,126,587 in 1958 (in 1957 M$1,806,800,000) were principally food (M$525,806,591) and manufactured goods (M$260,794,784).

Principal Events, 1959.—In elections held in August the Alliance Party won 73 of the 104 seats in the national legislature. In the new government Tengu (Prince) Abdul Rahman resumed office as prime minister on August 21. He had resigned on February 9 to lead his party's election campaign.

Only 350 Communist guerrillas remained at large on federal territory at the beginning of 1959. Since the start of Communist terrorism in 1948, 10,527 Communists had been killed or captured. A government white paper, published in March, warned that the Chinese Communists persisted in their efforts to gain control of Malaya by long-term methods of subversion.

A central government bank, with assets of $33 million, was opened ceremonially at Kuala Lumpur on January 24 by the paramount ruler.

Announcement was made in the House of Commons on June 18 that the United Kingdom would provide the Federation of Malaya with a grant of £2,500,000 in 1960 and another of £1,500,000 in 1961 toward the cost of wiping out Communist terrorism. Further help in cash and kind was to include the gift of the Royal Air Force installations (valued at £2,500,000) at Kuala Lumpur, and of other military installations.

Early in January the prime minister made a state visit to the Philippines. After his discussions with President Carlos P. Garcia, it was announced that a program of close economic and cultural cooperation had been agreed on between the two countries to ward off Communist inroads in Asia.

The Malayan capital, Kuala Lumpur, celebrated its 100th anniversary on June 13. Among distinguished visitors was Singapore Prime Minister Lee Kuan Yew.

DONOVAN ROWSE,
Author and Publicist.

MALDIVE ISLANDS. The Maldive archipelago (land area, 115 square miles) is a sultanate under British protection, comprising more than 2,000 widely scattered coral islands situated some 400 miles southwest of Ceylon. In 1958 the Maldivians, who are almost all Moslems, numbered approximately 90,000, of whom about 8,000 inhabit Male, the capital. Fishing and subsistence farming are the principal occupations, and fish, shells, coir, and copra are exported.

In March 1959 the southernmost atolls, including Addu atoll where the Royal Air Force has been building a staging post on the island of Gan as part of the British Asian defense chain, revolted against new high taxes imposed by the government of Sultan Mohamed Farid Didi. Abdullah Afif Didi, the rebel leader, proclaimed the territory in revolt the United Suvadiva Islands and sought British recognition. Although by treaty Britain had agreed not to interfere in Maldivian internal affairs, she sent food in March to one of the starving atolls, Huvadu, part of the secessionist territory. The government in Male protested that the British were aiding and encouraging the rebels, a charge the British denied in August.

MALGACHE REPUBLIC. An autonomous republic of the French Community (q.v.), comprising the island of Madagascar and island dependencies (chiefly Nossi-Bé and Sainte-Marie), situated about 250 miles off the east coast of Africa. Estimated area, 227,800 square miles; pop. (est. 1958), 5,050,000, including (in 1956) 74,085 nonindigenous persons, mainly French. The indigenous population consists of over 20 different ethnic groups of Negro, Arab, and Malayo-Polynesian origin. Malgache (Malagasy) and French are the official languages. Chief cities and populations (est. 1957): Tananarive, the capital (193,162), Majunga (50,356), and Tamatave, a major port (est. 1952, 39,900).

Government.—Formerly the French overseas territory of Madagascar, the Malgache (or Malagash) Republic chose the status of a member state of the French Community on Oct. 21, 1958. The Malgache Republic has self-rule in domestic affairs, with the Community exercising control of foreign relations, defense, currency, strategic minerals, and certain other matters. The republic adopted its constitution on April 29, 1959. The bicameral legislature consists of a Senate, whose members serve for six years (one third are appointed by the government, two thirds are elected by representatives of the provincial, municipal, and rural communities); and a National Assembly elected directly by universal suffrage for a five-year term. The president of the republic is elected for a seven-year term by an electoral college consisting of members of the Senate and National Assembly, members of the provincial general councils, and delegates of the municipal and rural assemblies. Philibert Tsiranana, leader of the Social Democratic Party, was elected president on May 1, 1959.

Education and Religion.—In 1958 there were 2,674 schools with a total of 344,885 pupils (46.5% of the school-age population). There are schools of medicine, law, and administration at Tananarive. An estimated 66% of the population was illiterate in 1953. Roman Catholic and Protestant missions have converted a considerable portion of the native population to Christianity. Tribesmen in the remote areas are mostly animists.

Transportation and Communications.—The republic's 4 railway lines have a total route length of 538 miles. All-weather roads and trails aggregate about 16,000 miles. There are over 80 airfields, the chief of which is at Tananarive. In 1957 there were 15,500 passenger cars and 11,412 telephones.

Finance.—The general budget for 1958 totaled 14,571 million francs CFA; the budgets of the 6 provinces aggregated 13,381 million (the franc CFA equals 2 metropolitan francs).

Production.—The chief economic activities are agriculture and stock raising (mainly cattle). Over half the cultivated area is devoted to rice, the chief subsistence crop as well as an important export; other subsistence crops are corn, manioc, sorghum, peanuts, peas and beans, and bananas. Cash crops, which provide the bulk of exports, include coffee, rice, sugar, sisal, raffia, tobacco, cloves, vanilla (of which the Malgache Republic is the world's largest producer), and tapioca. Principal minerals are graphite (10,760 metric tons in 1958), mica (921), industrial beryls and garnets, and quartz. Manufactures include canned and frozen meats, hides, rum, alcohol, soap, woven silk and cotton goods, cement and bricks, refined sugar and rice, and other processed agricultural products.

Foreign Trade.—Exports in 1958 totaled 20,248 million francs CFA; imports, 26,563 million. Chief exports and quantities shipped in 1958 were (in metric tons): green coffee, 47,821; rice, 58,228; vanilla, 438; sugar, 39,133; and tobacco, 4,320. France took 58% of 1958 exports and provided 71% of imports.

Principal Events, 1959.—Philibert Tsiranana, the stanchly pro-French premier of the former territorial government, was chosen first president of the Malgache Republic by an almost unanimous vote of the Malgache Parliament on May 1, 1959. French President Charles de Gaulle made a tour of the new autonomous republic beginning July 4, and presided over the French Community's Executive Council meeting in Tananarive, July 7–8. King Mohamed V of Morocco visited the republic, on February 22–March 2. President Tsiranana arrived in New York on November 7, on a two-week visit to the United States. On December 20, following talks with French leaders in Paris, Tsiranana announced that he had obtained French approval of full independence for the Malgache Republic within the Community.

A series of hurricanes and heavy rains, beginning on March 26, resulted in floods over large sections of the island of Madagascar, leaving over 300 persons dead and causing heavy damage to homes, crops, and communications.

M. J. G.

MALI FEDERATION. A federation of African states which came into being in 1959 as an outcome of the movement toward unity in certain of the newly autonomous African republics of the French Community (q.v.). In its first year of existence, the Mali Federation comprised Senegal and Soudan (qq.v.). The seat of administration is at Dakar, Senegal.

On Dec. 29–30, 1958, shortly after seven of the former territories of French West Africa (q.v.) had chosen to become autonomous republics of the French Community, leaders of Senegal, Soudan, Upper Volta, and Dahomey met in Bamako, Soudan, and agreed to form a federation within the French Community. At a conference in Dakar on Jan. 17, 1959, delegates from these four republics adopted a constitution providing for a Federal Assembly and other federal organs, and permitting members to secede or other states to join. Under pressure from antifederalist elements (led by Félix Houphouët-Boigny of Ivory Coast), Dahomey and Upper Volta subsequently withdrew, leaving only Senegal and Soudan. Modibo Keita, premier of Soudan, was chosen first president of the Mali Federation on April 4, and he named a cabinet on the following day. Léopold Senghor of Senegal serves as president of the Federal Assembly. Leading federation proponents of Senegal, Soudan, and other autonomous republics formed a new African Federalist Party at Dakar on March 25.

Senghor, Keita, and Senegalese Premier Mamadou Dia, the federation's leading spokesmen, envision Mali as an independent federation associated with France in loose commonwealth ties. At a meeting of the French Community's Executive Council in Paris, Sept. 10–11, 1959, Keita and Dia stated to French President Charles de Gaulle the Mali Federation's desire for independence. De

Gaulle, in an address at Saint-Louis, Senegal, on December 12, declared that the Mali Federation would accede to full sovereignty with the aid and accord of France.

MALTA. Founded in 1814, this British crown colony, situated about halfway between Gibraltar and Suez, comprises the islands of Malta (95 square miles), base of the Royal Navy and Mediterranean headquarters of the North Atlantic Treaty Organization (NATO); Gozo (26 square miles); and Comino (1 square mile). As of Jan. 1, 1959, the population totaled 323,970. Valletta (pop., 18,403), one of the finest deepwater harbors in the world, is the capital and chief port.

Letters patent (1947) provided for a governor (from June 8, 1959, Admiral Sir Guy Grantham); an elected Legislative Assembly of 40 members; and an Executive Council, consisting of the prime minister and 7 other ministers, which, together with a 5-member Nominated Council, forms also the Privy Council. The colony has been without an elected government since April 21, 1958, when amid riots in Valletta over the United Kingdom's policy toward Malta, the government headed by Prime Minister Dom Mintoff resigned and the Legislative Assembly was dissolved.

Ten persons were injured in resumed rioting on Feb. 27, 1959, following the dismissal of more than 6,000 workers at the transfer of the Admiralty dockyard to private operation. On February 16, the British House of Commons voted to revoke Malta's 1947 constitution in favor of an interim government (effective April 15), headed by the governor, who is advised by an Executive Council comprising both official and nominated members. The United Kingdom government meanwhile announced that further constitutional talks would be held with Maltese political parties with a view to the restoration of self-government; also, that a contribution of £29 million would be made to Malta in the next 5 years toward the cost of the government's capital program, conversion of the naval dockyards to civil use, and the encouragement of new industries.

Valletta was relinquished on Sept. 29, 1959, as base of the United States Sixth Fleet, which was being transferred to Sicily.

In 1958–59 actual revenue totaled £12,835,983, and actual expenditure, £13,469,633. Educational facilities in 1959 included 109 primary schools (55,251 pupils), 6 secondary schools (3,190 pupils), 5 technical schools (875 students), 91 private schools (17,830 pupils), and the Royal University of Malta (300 students). Adult education classes, instituted in 1946, had an attendance of 1,200 in 1958.

Exports were valued in 1958 at £995,461, and included hides and skins, gloves, scrap metal, potatoes, flower seed, and beer. Re-exports were valued at £2,599,811, and imports at £28,820,474. Air services connect the colony with Britain, France, Italy, the Netherlands, Tunisia, Libya, Cyprus, Egypt, the Sudan, Kenya, Iraq, and Malaya.

MANCHURIA. A region of northeastern China. See CHINA, PEOPLE'S REPUBLIC OF.

MANGANESE. World production of manganese ore was estimated at 13,049,000 short tons in 1958, compared with 14,126,000 short tons in 1957. The accompanying table shows data on the United States manganese industry, based on compilations by the U.S. Bureau of Mines.

United States output (shipments) of 323,108 short tons (consisting of ore, concentrate, and nodules containing 35% or more of manganese) constituted 2% of world output in 1958, compared with 3% in 1957. Nevada, Arizona, and Montana continued to supply the chief part of the total. The average grade of imported manganese ore was 46.9% manganese, the highest grade recorded for general imports since 1947 (46.1% in 1957 and 45.4% in 1956), based on U.S. Bureau of Census figures. Brazil supplied 27% of total ore received in 1958; India, 26%; Ghana, 13%; Union of South Africa, 11%; and the Belgian Congo, 6%.

MANGANESE IN THE UNITED STATES
(Thousands of short tons)

	1955	1956	1957	1958
Mine shipments	287.3	344.7	366.3	323.1
Metallurgical ore	275.5	341.3	364.2	323.1
Battery ore	11.7	3.4	2.1	... [1]
Imports, general	2,078.2[1]	2,238.6	3,105.2	2,452.6
For consumption	2,109.6[1]	2,264.2	2,539.2	1,798.6
Available supply[2]	2 385.1[1]	2,608.9	2,905.5	2,121.7
Consumption	2,103.5	2,606.9	2,740.4	1,497.6
Ferromanganese-made	870.0	923.0	963.8	636.7

[1] Battery and metallurgical ore lumped. [2] Mine shipments plus imports for consumption.

In the first eight months of 1959, domestic mine shipments totaled 189,000 tons; general imports of ore, 1,659,523 tons; ferromanganese, 147,696 tons; exports of ore, 4,038 tons; and exports of ferromanganese, 2,724 tons—giving a net supply of 2,088,000 tons.

(See also MINERAL PRODUCTION.)

MANITOBA. The central province of Canada, Manitoba is bounded on the east by Ontario, on the west by Saskatchewan, on the south by the states of North Dakota and Minnesota, and on the north by the Northwest Territories and the 440-mile shoreline of Hudson Bay. Its area is 251,000 square miles, including 39,225 square miles of water. The population (1956 census) is 850,040 (est. Sept. 1, 1959, 888,000), of which approximately 60% is urban. The capital of the province is Winnipeg, with a population (1956) of 255,093; Greater Winnipeg, 409,121 (1959 est., 420,000). Other cities and populations (1956) are St. Boniface, 28,851; St. James, 26,502; Brandon, 24,796; East Kildonan, 18,718; Portage la Prairie, 10,525; Flin Flon, 10,234.

Government.—The crown is represented by a lieutenant-governor (Hon. Errick F. Willis). The government is headed by Premier Dufferin Roblin. The Progressive Conservatives were elected to office in provincial elections held on May 14, 1959. Party standings in the provincial Legislative Assembly are: Progressive Conservative, 35; Liberal Progressives, 11; Cooperative Commonwealth Federation (CCF), 10; Social Credit, 1. Manitoba has 14 members in the House of Commons and 6 representatives in the Senate in Ottawa.

Finance.—As of March 31, 1958, surplus over expenditure was $4,367.25, from revenue of $80,123,614.74.

Education.—There were 1,651 school districts with 169,482 pupils in 1957–58, and 6,645 qualified and 340 permit teachers. Six colleges are affiliated with the University of Manitoba. There is one teacher-training college, a technical vocational school, a medical college, and a new dental college which opened in the fall of 1958.

Public Health and Welfare.—Under the Manitoba Health Services Act there were 13 local health units in 1958 serving a total population of over 320,000. Laboratory and X-ray units operate with headquarters at Selkirk, Virden, Dauphin, Neepawa, and Portage la Prairie. There are mental hospitals at Brandon, Selkirk, and Portage la Prairie, and a psychopathic hospital in Winnipeg. The compulsory provincial health insurance covers standard (public) ward care and includes X-rays, operating and laboratory facilities, and nursing services.

Transportation and Communication.—As of Dec. 31, 1958, the government-owned telephone system had 248,054 subscribers. Exclusive of yard tracks and sidings there are 5,079 miles of railway. Estimated lengths of all-weather roads were: graveled, 2,386 miles; bituminized, 1,604; concrete, 166; provincial trunk highways, 3,644; secondary, 307; and others, 928 (not including municipal roads). Motor vehicle registrations numbered 249,860 in 1958.

Production.—Shipments of grain through the port of Churchill in 1958 totaled 20,109,155

bushels. The value of field crops (including only initial payments for wheat, oats, and barley) amounted to $167,307,000; livestock products, $76,030,000; dairy products, $33,821,000; poultry products, $28,725,000; and garden products, $9,000,000. Fur output was valued at $5,264,000, including $3,600,000 from fur farming. Wild pelts taken in the 1957–58 season included 360,287 muskrat, 123,246 squirrel, 43,236 weasel, 30,564 beaver, and 27,397 mink. The fish catch in 1957 totaled 31,963,600 pounds; fish products were valued at $6,253,524.

The estimated gross value of manufactured products in 1958 was $667 million. There were 55 new industries established in 1958.

The estimated value of mineral production in 1958 was $55,942,900, of which $26,553,300 represented metals. Crude oil production totaled 5,829,226 barrels, valued at $14,264,513. Other minerals include clay, structural materials, peat moss, and salt.

Principal Events, 1959.—Manitoba's Progressive Conservative government obtained an absolute majority in the Legislative Assembly as the result of provincial elections held May 14. The Progressive Conservative Party, which constituted a minority government prior to the elections, gained eight seats for a total of 34, and received 45% of the popular vote. The opposition Liberal Progressive Party won 11 seats, a loss of eight from its previous total, and the CCF took 10 seats, representing a drop of one. The assembly had been dissolved on March 30 following the government's defeat on a proposed budget.

Changes in the field of education emanated directly from recommendations by the Royal Commission on Education in its interim report. The changes included new methods of school financing, innovations in the grants system, and new administrative units. In February a provincial referendum on school districts resulted in the formation of 32 larger school area units.

Action on the Greater Winnipeg Investigating Committee's report on a system of metropolitan government for Greater Winnipeg was postponed until 1960. Also in 1960, test areas will be formed to determine the basis of crop insurance rates. Four new regional libraries were opened in 1959, making a total of six for the province.

Queen Elizabeth II and Prince Philip received an enthusiastic welcome to the province on their arrival at Winnipeg on July 24 during their Canadian tour (see also WINNIPEG).

In October it was announced that Errick F. Willis, former deputy premier who had also held the portfolios of agriculture and public works, had been appointed lieutenant-governor of the province (succeeding the Hon. John S. McDiarmid), his term to begin Jan. 15, 1960.

MAPLE PRODUCTS. Maple sirup production in the United States in 1959 (including sirup later made into sugar) was estimated at 1,191,000 gallons in the 11 major producing states. Unfavorable weather accounted for this drop of more than 21% from the 1958 production figure and of almost 28% from the 1948–57 average. The number of trees tapped was estimated at 5,075,000, compared with a ten-year average of 6,983,000. Major sirup-producing states, with estimated 1959 output in thousands of gallons, were: Vermont, 390; New York, 344; Ohio, 118; Pennsylvania, 90; Wisconsin, 88; Michigan, 51; and New Hampshire, 43.

Canada.—The 1958 farm value of Canadian maple products amounted to $8,440,000 (maple sirup, $8,064,000; maple sugar, $376,000), down 18% from 1957 and 15.5% below the 1951–55 average of $9,991,000. Production in 1958 comprised 2,403,000 gallons of sirup, compared with 3,068,000 in 1957, and 815,000 pounds of sugar, up from 661,000 in 1957. Quebec Province yielded approximately 80% of the total value, with Ontario the second-ranking producer.

MARINE BIOLOGY. Deep sea animals have held a fascination for man ever since he first began to sail the seven seas. There is still the possibility that legendary deep sea monsters may actually exist. Biological oceanographers are intensely interested in the many deep sea animals that have never been captured, and in learning more about those that have been described. Their interest transcends mere curiosity, for the sea is still a great unknown frontier, one that man must learn to utilize more and more as a source of food and raw materials.

Deep Sea Fish Trap.—Dredging and trawling become increasingly difficult and inadequate at depths exceeding 1,000 feet. In an effort to obtain deep sea specimens not caught in trawls, Dr. John Isaacs of the Scripps Institution of Oceanography has designed a deep sea fish trap in the form of a pyramid. The trap is baited and lowered to the bottom, where it is left for the desired length of time. It can be marked with a sonic buoy and easily relocated. Already the trap gives promise of being a valuable new tool in deep water research.

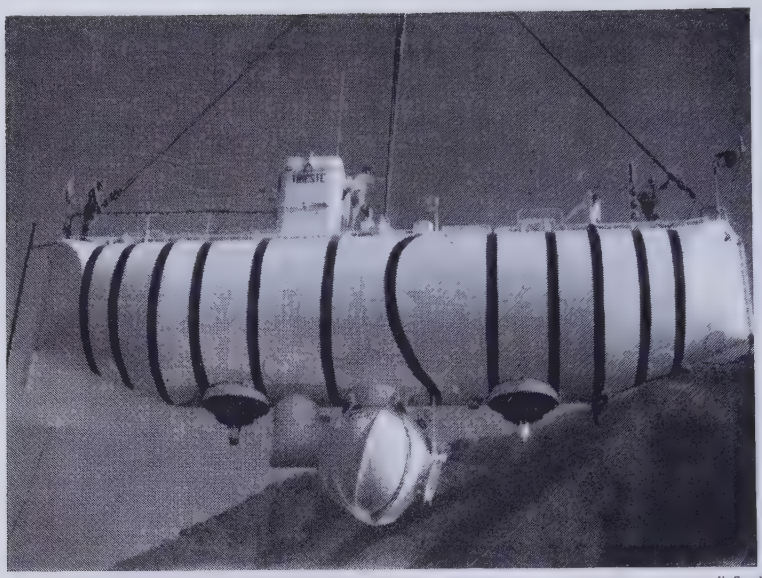
New Deep Sea Cameras.—Dr. R. H. Backus of the Woods Hole Oceanographic Institution began work in 1959 with a deep sea camera designed to photograph passing sea animals. Part of the camera's equipment is a device that sends out sound signals. Whenever an animal comes within range of the camera, the sound signal bounces off the animal and back to a receiving device, which, in turn, simultaneously fires an electronic flash unit and sets off the camera.

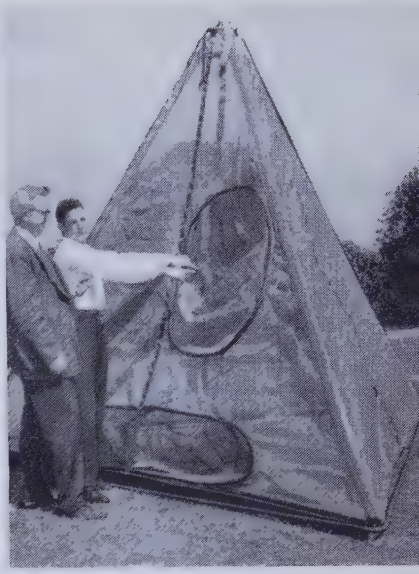
A luminescence camera, developed in 1959 by Drs. L. R. Breslau and H. E. Edgerton, is also in use. This camera takes a picture whenever a luminescent organism flashes within the camera's plane of focus. The light from the animal triggers the camera, which is equipped with an electronic flash that illuminates the organism. Both cameras can be used at depths of two miles or more.

Exploration with the Bathyscaphe.—Results of a 2½-hour, 3,600-foot descent into the Mediterranean by the bathyscaphe *Trieste*, another important tool in deep sea biology, were summarized in an article entitled "1100-Meter Dive in the Bathyscaph *Trieste*" in the January 1959 issue of *Limnology and Oceanography*. The *Trieste*, designed to withstand great pressures, is potentially capable of exploring some 99% of the sea floor.[1] (For details of the *Trieste*'s construction, the reader is referred to Auguste Piccard's book, *Earth, Sky and Sea*, 1956.)

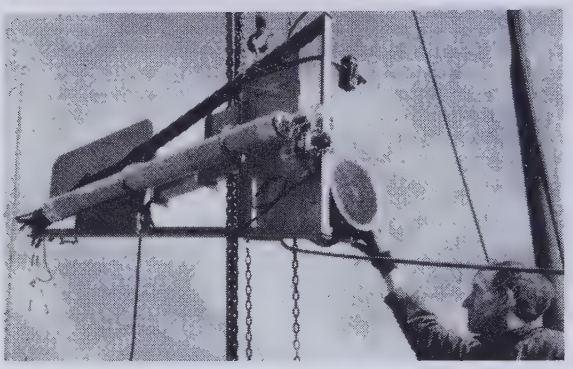
Dr. Robert S. Dietz of the Office of Naval Re-

[1] The *Trieste* made record-breaking descents to 18,600 feet (Nov. 14, 1959), 24,000 feet (Jan. 7, 1960), and 35,800 feet (Jan. 23, 1960) in the Marianas Trench.





U.S. NAVY; WOODS HOLE OCEANOGRAPHIC INSTITUTION; THE SAN DIEGO EVENING TRIBUNE



(*Top left*) The U.S. Navy bathyscaphe *Trieste*, designed to explore the ocean depths, is lowered into the water at San Diego, Calif. Main structure houses gasoline storage tanks to provide buoyancy, and spherical gondola underneath holds the two-man crew. The *Trieste* reached record depths of 18,600 feet on Nov. 14, 1959, 24,000 feet on Jan. 7, 1960, and 35,800 feet on Jan. 23, 1960—all in the Marianas Trench of the Pacific. (See also the picture under *Oceanography*.) (*Bottom left*) R. H. Backus of the Woods Hole Oceanographic Institution is shown with new deep sea camera. When a sea creature comes within range, sound signals sent out by the device are reflected back, triggering an electronic flash and setting off the camera. (*Above*) New deep sea fish trap developed at Scripps Institution of Oceanography enables scientists to catch and study marine specimens from extreme depths. Free-floating device, which returns to surface automatically, was invented by John Isaacs (l.), George Schick (r.), and Lewis Kidd.

search was the scientific observer on the dive reported. After 15 minutes of descent, the *Trieste* was down 150 feet, where surface wave action was no longer felt. At 520 feet (25 minutes) the twilight zone was reached. With floodlights on at this depth, it was apparent that particles visible in the water were increasing in abundance and that most of them were plankton organisms. At 1,150 feet the first flash of bioluminescence was seen, and at 1,300 feet steady luminescence was observed in the form of a row of lights, probably a fish. Between 1,625 and 1,700 feet, as the zone of complete darkness for man was entered, the superstructure of the craft became invisible from the observation windows. (Piccard had found on previous dives that this occurred at about 1,950 feet if the eyes were fully adapted to the dark.) Although there is total darkness to the human eye at 2,000 feet in the clearest sea water, it has been postulated that the eyes of deep sea fish, probably 60 to 120 times as sensitive as the human eye, are able to perceive daylight at a depth of 3,500 feet or more.

Zooplankton appeared to be most concentrated between 1,600 and 2,300 feet. However, since the organisms seen were too small to be effective in reflecting the sound waves of depth recorders, it does not seem possible that zooplankton could be responsible for the "false bottom" or "deep scattering layer" often observed with sonic depth recorders. At about 135 feet above the ocean floor a small fish was seen, evidently of the deep sea genus *Bonapartia*.

After 75 minutes of descent the *Trieste* came to an imperceptible rest on the bottom at a depth of 3,600 feet. Here were seen several other fish, some animals resembling heart urchins, and a small shrimp. When ballast was dropped for the ascent, a swarm of small crustacea resembling isopods rose from the bottom above the cloud of mud. During the ascent, bioluminescence seemed to be greatest in the zone from 2,300 to 1,600 feet, where the greatest concentration of zooplankton was noted on the descent.

Dr. Athelstan Spilhaus, in *Turn to the Sea*, a 1959 publication of the National Academy of Sciences, predicts that man will soon have much more versatile bathyscaphes that can go to the deepest bottom. In line with this prediction is a newly designed undersea craft described by Dr. R. L. Engel and F. Pierce at the 1st International Oceanographic Congress held at the United Nations in New York in August and September 1959. Although based on the principle of Piccard's bathyscaphe, the new undersea exploring vessel will be more mobile, have greater range, and contain more scientific equipment. It will be 69 feet long and 9 feet in diameter, and will weight 83 tons. Two 20 hp. motors will propel it at about 7 mph. within a 150-mile range. It will withstand the deepest sea pressures, will accommodate 3 persons, and may remain submerged up to 48 hours.

Seafood from Deeper Water.—The possibility of a fishery in deeper water has been suggested by Dr. W. C. Schroeder of the Woods Hole Oceanographic Institution. It has been discovered that New England lobsters, living at a depth of 360 to 1,500 feet, inhabit an area 400 miles long and 5 to 10 miles wide between the eastern part of Georges Bank and Delaware Bay. Thus far, 99% of the lobsters caught along the New England coast are taken in lobster pots in shallow water.

In the same area, at 900 to 4,200 feet or

deeper, there exists a species of crab, *Geryon quinquedans,* which ranges southward from Nova Scotia to at least Cuba. Dr. Schroeder believes this animal could become an important item of seafood.

HAROLD J. HUMM,
Jacques Loeb Associate in Marine Biology, The Rockefeller Institute.

MARINE CORPS, U.S. The U.S. Marine Corps, the amphibious branch of the nation's armed forces and one of the two services within the Department of the Navy, had a strength of 175,000 officers and men at the close of 1959, as compared with just under 190,000 in 1958. In spite of this reduction in manpower, however, the corps continued to maintain three combat divisions and three aircraft wings in a state of immediate readiness. Lt. Gen. David M. Shoup became the corps' new commandant on Jan. 1, 1960, succeeding Gen. Randolph McC. Pate.

In a continuing program of strengthening its capabilities for amphibious assault, the corps during 1959 acquired two converted aircraft carriers for service as helicopter platforms with the Navy's Atlantic and Pacific fleets. These ships, formerly the U.S.S. *Boxer* and the U.S.S. *Princeton,* are capable of transporting troops, helicopters, and equipment over long distances at high speed and then launching an airborne assault by helicopter while still far out at sea. Two fleet Marine forces provide fleet commanders with means of projecting naval power ashore wherever and whenever required, by means of integrated air-ground teams and landing forces.

In the field of research and development, the Marine Corps pursued work on a new surface-to-air shoulder-fired missile system capable of destroying low-flying aircraft. Also under study were air-suspension vehicles, hydrofoils, one-man helicopters, and body armor.

Augmenting the regular forces in 1959 was a trained Marine Corps Reserve of approximately 300,000. Of these, 42,000 officers and men received drill pay for participation in drills and summer encampments as members of 228 ground and 85 air units. Members of the Ready Reserve element, subject to mobilization by the president in an emergency, numbered the authorized 208,000. The remaining reservists were members of the Standby Reserve, subject to recall only by Congress. Five new helicopter units were added to the Marine Reserve air arm during the year.

The major Marine Corps bases in the United States in 1959 were located at Camp Lejeune, N.C., and Camp Pendleton and Twentynine Palms, Calif.; fixed-wing air stations, at Cherry Point, N.C., Beaufort, S.C., and El Toro, Calif.; rotary-wing bases at Santa Ana, Calif., and New River, N.C.; recruit depots, at San Diego, Calif., and Parris Island, S.C.; and the Marine Corps School, at Quantico, Va. A new auxiliary air station was commissioned at Yuma, Ariz., in January as a fixed-wing training base.

Among the highlights of 1959 in the Marine Corps was the crossing of the Atlantic in just over five hours by two Marine Corps A4D-2 Skyhawk jet attack bombers on May 4. This marked the first transoceanic flight of single-engine jets using the "buddy system" of in-flight refueling. The 2,270-mile flight was from Argentia, Newfoundland, to Rota, Spain.

In July more than two million people saw the Marines storm ashore with combat realism in amphibious landing demonstrations at five major port cities around the Great Lakes. These maneuvers were part of Operation Inland Sea, the Navy's tribute to the newly opened St. Lawrence Seaway (q.v.).

In August, Marine Helicopter Squadron 261, aboard the U.S.S. *Thetis Bay,* was rushed to Taiwan to carry out a week-long mercy mission during the worst floods in the island's history. The helicopters lifted more than 1,600,000 pounds of relief supplies during 897 missions and transported some 855 passengers.

MARITIME ADMINISTRATION. See SHIPBUILDING; and for merchant marine data, see MERCHANT MARINE.

MARRIAGE AND DIVORCE. Marriage.—The marriage rate is highly susceptible to economic conditions. During the business recession of September 1957 through March 1958, marriage rates dropped 10 per cent below the rates of the same months of the preceding year. As business conditions revived in the spring of 1958, the marriage rate picked up. The trend in the annual number of marriages since 1956 has been decidedly downward, however, due to the relatively small number of persons in the marriageable ages, resulting from the low birth rate during the economic depression of the 1930's.

In the early 1960's, if the present popularity of marriage should continue, there will be a rapid increase in number of marriages. At that time the high birth rate during World War II will show up in the greater number of young people reaching marriageable age.

Youthful marriages continue to increase, and vital statistics data indicate that married persons continue to have greater longevity. The death rate of married men aged 20 to 44 is only one half that of single males and less than one half that of the widowed and divorced. Married women also have a lower death rate than single women in every age group.

The accompanying table shows that the all-time high in marriages was reached in 1947. Marriages are now near the low point in both numbers and rate for the years since 1940.

Canadian data show a similar decrease in marriages. In 1958 there were only 131,525 marriages, compared with 133,186 in 1957. At the postwar peak in 1946, Canada had 137,388 marriages and a rate of 10.9 per 1,000 population, compared with a rate of only 7.7 in 1958. Much the same factors in the economic situation and

Wearing protective clothing, these men make up one of the Marine Corps teams which are trained to prevent or reduce casualties in areas hit by nuclear, biological, or chemical attack. This unit is stationed at Kaneohe Bay, Hawaii.

age structure of the population apply to Canada as to the United States.

U.S. MARRIAGE AND DIVORCE DATA, 1946–59

Year	Marriages			Divorces		
	Number of marriage licenses[1]	Rate per 1,000 pop.	Percentage change	Number of Divorces[1]	Rate per 1,000 pop.	Percentage change
1959	1,501,000[2]	8.5	2.4	407,000[3]	2.4	7.1
1958	1,445,000	8.3	−6.7	380,000	2.2	0.0
1957	1,518,000	8.9	−6.3	381,000	2.2	−1.0
1956	1,585,000	9.5	2.1	382,000	2.3	−4.3
1955	1,531,000	9.3	1.1	377,000	2.3	−4.2
1954	1,490,000	9.2	−6.1	379,000	2.4	−4.0
1953	1,546,000	9.8	−1.0	390,000	2.5	0.0
1952	1,539,318	9.9	−4.8	392,000	2.5	0.0
1951	1,594,694	10.4	−6.3	381,000	2.5	−3.8
1950	1,667,231	11.1	4.7	385,144	2.6	−3.7
1949	1,579,789	10.6	−14.5	397,000	2.7	−3.6
1948	1,811,155	12.4	−10.8	408,000	2.8	−17.6
1947	1,991,878	13.9	−15.2	438,000	3.4	−20.9
1946	2,291,045	16.4	34.4	610,000	4.3	22.9

[1] For 1946, based on population including armed forces overseas; for 1947–59, based on population excluding armed forces overseas. [2] Estimate based on licenses issued during the first six months. [3] Estimate based on number of divorces in 29 states for the first six months.

Divorce.—The divorce rate in the United States increased for the first time since 1946, when divorce rates and numbers were at an all-time peak. It is estimated, on the basis of figures for the first six months of the year, that divorces will total 407,000 in 1959, an increase of 7% over the preceding year. The rate for 1946 was 4.3 per 1,000 population, compared with the anticipated rate of 2.4 for 1959.

The Canadian divorce picture continued to improve through 1958, in which year Canada had only 6,211 divorces. The rate dropped from 0.66 per 1,000 population in the peak year 1947 to 0.36 in 1958. These rates are very low, compared with those of the United States.

PAUL H. LANDIS,
State Professor of Sociology, Washington State University.

MARSHALL, George Catlett (78), American soldier and diplomat: b. Uniontown, Pa., Dec. 31, 1880; d. Washington, D.C., Oct. 16, 1959. In a half-century of selfless and dedicated service to his country, Marshall won a place in history both as a man of war and as a man of peace. As a soldier he organized and commanded the greatest fighting force the world had ever seen, and as a statesman he helped bring strength and stability to the war-debilitated nations of the free world. Through the historic plan which bears his name, western Europe was able to resist Communist subversion in the postwar era and grow into a strong bastion of democracy. One of the acclaimed battle strategists of history, and holder of the nation's highest military rank, he received the decorations of many countries for his exploits in two world wars, but the most significant honor came to him on Oct. 30, 1953, when General of the Army Marshall was awarded the Nobel Peace Prize.

Denied access to West Point because of the system of political appointments, young Marshall entered Virginia Military Institute in 1897, became a keen student of military tactics (especially those of his lifelong hero, Thomas J. "Stonewall" Jackson), and graduated as senior first captain of the cadet corps. Commissioned a 2d lieutenant in 1901, he was stationed for nearly two years in the Philippines before returning to the United States. From 1907 to 1910 the young lieutenant studied at the Infantry-Cavalry School and at the Army Staff College, Fort Leavenworth, and after graduation stayed on as an instructor. His reputation as a tactician and planner was enhanced in his second tour of duty in the Philippines (1913–16), during which his direction of forces in war maneuvers prompted Gen. James Franklin Bell to declare: "Keep your eyes on George Marshall. He is the greatest military genius of America since Stonewall Jackson."

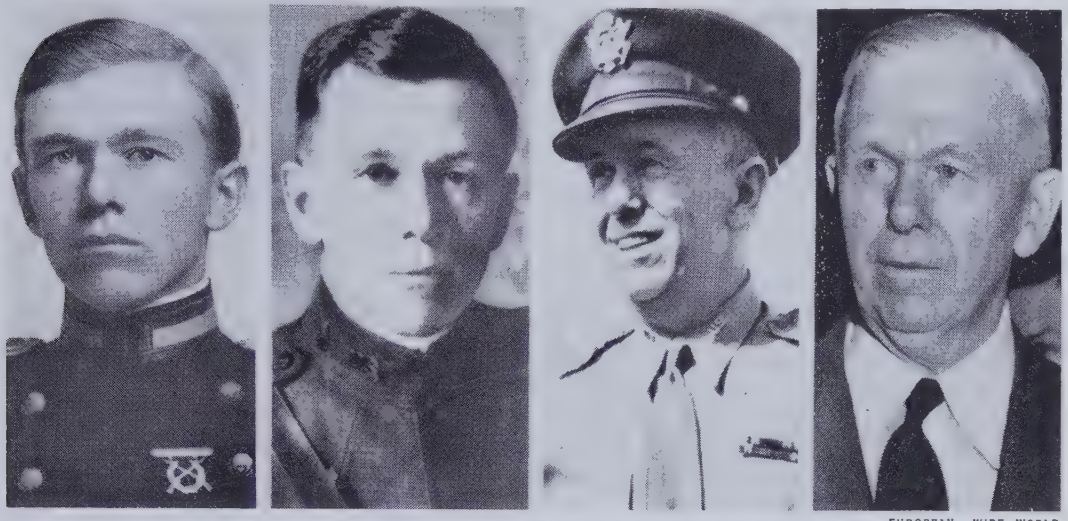
Despite his accomplishments—promotions came slowly in the Army of that day—it was not until 1916 that Marshall advanced to captain. In this rank, as an aide on the General Staff, he went to France in 1917 after the United States entered World War I. In 1918, while attached to the First Army, he planned and executed a brilliant maneuver which transferred, in two weeks of movement by night, some 500,000 troops and 2,700 guns from St.-Mihiel to the Argonne front. The offensive took the Germans completely by surprise, and Marshall's daring stroke earned this tribute from the taciturn Gen. John J. Pershing: "He's a man who understands military."

With the Armistice, Marshall turned down attractive business offers to devote himself to his military career. For five years beginning in 1919, he served as aide-de-camp to Pershing, and the two soldiers labored hard in Washington to convince Congress of the need for a strong military establishment. After serving with the infantry in Tientsin, China, from 1924 to 1927, Marshall, then a lieutenant colonel, joined the Infantry School at Fort Benning as assistant commandant, and in the next five years developed it into a valuable training ground for junior officers. In the years 1932–38 Marshall held a number of command assignments in the states as he rose to colonel (1933) and to brigadier general (1936).

In 1938 Marshall was assigned to the Army General Staff. From assistant chief of the War Plans Division, deputy chief of staff, and, in July 1939, acting chief of staff, he advanced to the position where, on Sept. 1, 1939, the day Hitler sent his *Wehrmacht* plunging into Poland, President Roosevelt tapped Marshall over 34 higher officers to direct the nation's military establishment as chief of staff. Now a general, Marshall set about the task of preparing the poorly trained, 400,000-man Army for the global conflict ahead. But his pleas for expanding and mobilizing the nation's armed forces went unheeded until the fall of 1940 when Congress adopted the program which he and others had been urging. How well Marshall succeeded in strengthening the Army and its command staffs in the year that followed was demonstrated when a force of a million men took part in maneuvers in the fall of 1941—on the eve of Pearl Harbor.

Under his administrative genius the Army reached a World War II peak of more than 8 million men, supported by 69,000 planes of all types. He mapped the master strategy which eventually reduced the Axis powers, and he convinced Roosevelt that a direct thrust across the English Channel was the best route to victory, thus prevailing over Churchill's favored "soft underbelly" invasion through the Balkans. Marshall's belief that the Allies must first conquer Germany before concentrating on Japan also was upheld, over the protests of Gen. Douglas MacArthur. Marshall's service as chief of staff was marked by his astute judgment, his patience and understanding, and his global concept of battle and logistics. Although he earnestly desired to head the Normandy invasion himself, he sacrificed personal feelings and handed the assignment to Gen. Dwight D. Eisenhower. In this decision he deferred to the wishes of President Roosevelt, who told him, "I wouldn't sleep at night with you out of the country." Marshall accompanied Roosevelt as an adviser to the conferences at Casablanca, Quebec, and Teheran (and in 1945 went with President Truman to Potsdam). On Dec. 15, 1944, Marshall was elevated to the five-star rank of general of the army.

The war successfully concluded, Marshall stepped down as chief of staff on Nov. 20, 1945, into retirement. But six days later, President Truman dispatched him as his special representative to China, where for more than a year Marshall tried in vain to negotiate a settlement between the Communists and Nationalists. Recalled to Washington, he was sworn in as secretary of state on Jan. 21, 1947, becoming the first military man to occupy that office. Until he resigned two years later because of poor health, he worked to bolster the free world against the growing Soviet menace. His first accomplishment was in helping to frame the Truman Doctrine, a program of aid which



EUROPEAN; WIDE WORLD

Four stages in the career of George C. Marshall, who died on October 16. He is shown (from left) as a young officer about the time of his commission as a 2d lieutenant in 1901, as a colonel in France in 1919, as Army chief of staff in 1942, and as secretary of state in 1947. He came out of retirement after the Korean War began to serve as secretary of defense.

helped save Greece and Turkey from communism. On June 5, 1947, in his now-famous Harvard commencement address, he pronounced the United States intention to assist militarily and economically any nation which resisted Soviet blandishments. Within the next four years, the Marshall Plan (incorporated into the European Recovery Program) poured $22.4 billion into the economies of 23 countries. Billions more followed under successive programs of both Democratic and Republican administrations. After leaving the State Department, he served as president of the American Red Cross in 1949–50.

With the start of hostilities in Korea, Marshall was once again called out of retirement. On Sept. 12, 1950, he became secretary of defense, remaining in the post for one year. In failing health, he spent the rest of his days at his home in Leesburg, Va., devoting his time to gardening and to reading. Endowed with a deep, abiding sense of honor and integrity, it was characteristic of him that he steadfastly turned down offers of political or financial gain which would have traded on his career. These included a $1 million bid for his memoirs, which he rejected with this observation: "The government of the United States has already paid me for all of my services."

MARSHALL ISLANDS. See PACIFIC ISLANDS.

MARTINIQUE. An island in the Windward Islands group of the Caribbean Sea, forming an overseas department of France. Area, 425 square miles; pop. (est. 1958), 265,000, mainly Negroes. French is the official language, although a creole patois is the popular tongue. Fort-de-France (60,648) is the capital. The department is governed by a prefect and an elected General Council of 36 members. The 1959 budget totaled 4,503 million francs. About 80% of the population is literate. In 1957–58 there were 201 public primary schools (64,244 pupils), 2 lycées (2,841), a vocational school (787), and a law school (328).

The economy is dominated by the production of sugar and related products. Sugar output in 1958–59 totaled 86,000 short tons raw value (75,000 in 1957–58). Bananas, cassava, mangoes, citrus fruits, sweet potatoes, coffee, cacao, tobacco, and vanilla are also grown. Principal industries are sugar mills, rum distilleries, and pineapple and banana canning plants. Exports in 1958 totaled 12,157 million francs; imports, 17,433 million. Chief exports were fresh bananas, 93,343 metric tons (5,581 million francs); sugar, 60,501; and rum, 12,275. About 80% of trade is with France. Air France and other international lines provide air services.

During Dec. 20–22, 1959, rioting in Fort-de-France by nationalists demanding greater self-rule resulted in three persons killed and required the flying of police reinforcements to the capital from nearby Guadeloupe.

MARYLAND. Middle Atlantic state, United States; one of the original 13 states. The "Old Line State" ranks 42d in area and 22d in population among the 50 states.

Area and Population.—Area: 10,577 square miles (land, 9,881; inland water, 696), divided into 23 counties and the independent city of Baltimore. Population: (1950) 2,343,001; (est., July 1, 1958) 2,961,000. Urban places with populations above 7,500 in 1950 (unless another date is given):

Annapolis[1]	10,047	Hagerstown	36,260
Baltimore	984,000[2]	Havre de Grace	7,809
Cambridge	10,351	Hyattsville	12,308
College Park	11,170	Mt. Rainier	10,989
Cumberland	37,679	Salisbury	15,141
Frederick	18,142	Takoma Park	13,341

[1] Capital; population given excludes that of the U.S. Naval Academy. [2] Mid-1958 estimate.

Executive.—Chief state officers in 1959:
Governor: J. Millard Tawes (Democrat)
Secretary of State: Thomas B. Finan
Treasurer: Hooper S. Miles
Attorney General: C. Ferdinand Sybert
Auditor: Leo J. Parr
Supt. of Public Instruction: Thomas G. Pullen

Constitution and Judiciary.—The present constitution went into effect in 1867. The highest tribunal, the Court of Appeals, comprises five justices; chief justice in 1959 was Frederick W. Brune.

Legislature.—The Maryland General Assembly comprises a 29-member Senate (in 1959, 26 Democrats and 3 Republicans) and a 123-member House of Delegates (116 Democrats and 7 Republicans), which meet in a 90-day session beginning on the first Wednesday of January in odd-numbered years, and in a 30-day session, limited to fiscal, emergency, and state-wide matters, commencing the first Wednesday in February of even-numbered years. (See below, *Principal Events, 1959.*)

Finance.—In the 1958–59 fiscal year, state revenue of $408,016,635 comprised $314,618,233 from state tax sources, $68,443,790 from the federal government, and $24,954,612 from other sources. Tax revenue consisted of $55,803,858 from a 2% (and later 3%) general sales tax,

$81,554,134 from individual income taxes, $18,132,338 from corporate income taxes, $50,974,854 from motor fuel taxes, $29,511,558 from licensing, and $78,641,491 from other sources. Expenditures of $427,085,362 comprised $121,197,448 for education, $78,157,255 for health, welfare, and safety, $123,722,521 for highways, and $104,008,138 for other purposes. Long-term indebtedness amounted to $206,530,000 on June 30, 1959.

Banking.—As of June 10, 1959, the state's 53 national banks had $1,067,186,000 in assets, $706,122,000 in demand deposits, and $252,184,000 in time deposits. The 96 state banks (Dec. 31, 1958) had assets of $2,082,453,846.12, demand deposits of $939,462,241.88, and time deposits of $941,898,273.38.

Education.—School attendance is compulsory between the ages of 7 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $160,790,542 ($335.53 per pupil), comprising $97,931,095 from local school districts, $57,827,217 from the state, and $5,032,230 from the federal government. Outlays for construction and improvements amounted to $64,066,528, and teachers' and principals' salaries averaged $4,944 (high school, $5,092; elementary, $4,821).

MARYLAND SCHOOL STATISTICS, 1957–58

Type of school	No.	Teachers	Students
Public elementary (k-6)	801	11,411	331,619
Public secondary (7–12)	252	9,150	200,502
Private and parochial elementary and secondary	394	3,964	114,836
Public junior colleges	7	187	2,296
State teachers colleges	5	216	2,895
Colleges and universities	...	...	46,029*

* Total enrollment in all colleges and universities for 1958–59, including 17 colleges and universities, 8 private junior colleges, and the 7 public junior colleges and 5 teachers colleges separately listed.

Social Welfare.—In the 1958–59 fiscal year, public assistance expenditures from local, state, and federal funds (excluding institutional costs) totaled $22,562,268, including $6,212,956 for the aged, $10,052,072 for dependent children, and $3,822,426 for the permanently and totally disabled. A monthly average of 54,636 persons received public assistance. State expenditures for mental health activities totaled $19,405,887; for correctional and penal programs, $6,094,519.

Labor Force.—The state's labor force totaled 1,116,300 persons in June 1959, including 58,500 agricultural workers. Nonagricultural employment was up slightly, to 970,100, from 965,000 in the previous June, but below the 1,020,000 average for the 12 intervening months. Of all wage and salaried (nonfarm) workers in 1959, 29.7% were engaged in manufacturing, 20.7% in trade, and 16.5% in government. Unemployment was down to 61,800 in June 1959 from 86,800 a year earlier. The steel strike, which began in mid-July 1959, idled an additional 28,000 workers. During the 12 months ending June 30, 1959, the state paid $52,635,880 in unemployment compensation claims.

Manufacturing.—The state's 3,312 manufacturing plants in 1958 employed 257,930 persons who received $1,253,161,061 in wages. Value added by manufacture (1957) totaled $2,294,868,000, and outlays for new plants and equipment amounted to $270,769,000. Production workers in manufacturing averaged $85.26 for an average workweek of 40.6 hours in August 1959.

MAJOR MARYLAND MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.* (thousands of dollars)
Transportation equipment	51,480	$274,004	$415,262
Primary metal industries	39,165	217,424	389,466
Food and kindred products	35,414	135,706	274,654
Chemicals and products	13,321	60,323	186,676
Electrical machinery	16,738	92,397	146,545
Fabricated metal products	15,851	75,688	139,228
Apparel and related products	26,002	74,236	117,708
Nonelectrical machinery	12,704	60,840	104,444
Printing and publishing	11,529	55,562	93,452
Stone, clay, glass products	8,564	40,532	90,873

* For definition see footnote 1 in the article *Industrial Production.* (Source: *Annual Survey of Manufactures: 1957.*)

Mining.—In 1958 Maryland ranked 38th among the states in the value of its mineral production, with 0.27% of the national total. The state was seventh in the output of coke, and, in addition to the minerals listed in the accompanying table, produced potash, selenium, talc, soapstone, pyrophyllite, and tellurium.

MARYLAND MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Clay[1]	605,000	$ 815,000
Coal	838,000	3,161,000
Coke	2,896,268	...
Natural gas (million cu. ft.)[2]	4,266	1,148,000
Sand and gravel	7,864,000	10,312,000
Stone	6,721,000	14,387,000
Other minerals	...	16,226,000
Total	...	$44,679,000[3]

[1] Excludes certain clays; value of which is included in "Other minerals." [2] Preliminary figure. [3] Total adjusted to eliminate duplication in the value of clays and stone. (Source: U.S. Bureau of Mines.)

Fisheries.—The commercial fish and shellfish catch in 1958 amounted to 66,091,000 pounds valued at $11,953,000. The two principal species were oysters (12,026,000 pounds valued at $6,668,000) and clams (4,985,000; $1,499,000).

Agriculture.—Cash farm income for the first nine months of 1959 dropped slightly to $185,277,000 from $190,024,000 in the corresponding period of 1958. For the full year 1958, income comprised $179,714,000 from livestock and livestock products, $79,418,000 from crops, and $5,403,000 from government payments. Principal income sources in 1958 were: dairy products, $71,553,000, and broilers, $55,691,000.

MARYLAND CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	1,144	1,270	1,400
Corn (1,000 bu.)	21,820	27,776	27,540
Hay (1,000 tons)	645	823	702
Peaches (1,000 bu.)	451	490	460
Potatoes (1,000 cwt.)	611*	610	502
Soybeans (1,000 bu.)	2,136	4,246	4,202
Sweet potatoes (1,000 cwt.)	513*	621	504
Tobacco (1,000 lb)	38,882	30,940	33,250
Wheat (1,000 bu.)	5,038	4,233	4,032

* Average, 1949–57. (Source: U.S. Department of Agriculture.

There were 33,200 farms in the state in 1958. Total acreage (1954) of 3,897,000 included 1,572,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 529,000 cattle and 2,751,000 chickens (excluding commercial broilers). During the week of Oct. 24–30, 1954, there were 65,993 family and hired workers engaged in farming.

Transportation and Communications.—In the 1958–59 fiscal year, state and federal spending for highways totaled $81,008,156, and new construction completed in the calendar year 1958 amounted to 134 miles.

Highways and roads on Jan. 1, 1959, totaled 19,689 miles (19,625 surfaced). Registered *motor vehicles* numbered 1,063,895 on Aug. 31, 1959, including 889,957 passenger cars. There were (1959) 13 *railroads* operating 1,320 line miles; 12 regularly scheduled *airlines;* and 128 *airports and airfields* (41 commercial and municipal, 6 military, and 80 private; and 1 seaplane base).

Communications media (1959) included 34 AM and 12 FM *radio stations;* 3 VHF and 1 UHF *television stations;* (1958) 11 daily *newspapers* and 75 other newspapers; and (Jan. 1, 1959) 303,900 business and 885,200 residential *telephones.*

Principal Events, 1959.—J. Millard Tawes took office on January 14 as Maryland's 59th governor and the first Democratic one in eight years. The

General Assembly met in 90-day session and enacted a number of reorganization measures. The State Roads Commission was expanded from three to seven members chosen on a geographical basis. Membership on the Tidewater Fisheries Commission and the State Racing Commission was increased from three to five persons each. The State Tax Commission as such was abolished and its quasijudicial and administrative functions were separated. The State Planning Commission was replaced by a Planning Department with a director and advisory board serving at the pleasure of the governor.

Additional legislation provided for the setting up of a penalty point system for drivers and chemical tests for suspected drunken drivers. A proposal to increase the membership of the Board of Regents of the University of Maryland from 11 to 15 was defeated in committee.

Governor Tawes completed executive action on 861 bills enacted by the 1959 General Assembly by signing 831 into law and vetoing 30.

In November, Gov. J. Lindsey Almond, Jr., of Virginia agreed to defer a suit challenging Maryland's right to rescind the Potomac River Compact of 1785 in exchange for a promise from Governor Tawes to support approval of a new agreement which will be voted on in a referendum in Maryland in 1960. The suit grew out of the action of the 1957 Maryland General Assembly which repealed the compact of 1785, charging violations of the fishing laws by Virginians.

The state estimated a surplus of about $20 million for the 1959–60 fiscal year. Governor Tawes indicated that the state would decline to spend a substantial portion of the expected surplus for current expenditures.

In mid-1959 unemployment was 58,800, or 5.4% of the total civilian labor force. By September, unemployment registered 56,700, or 5.1% of the labor force, compared with 71,000, or 6.4%, a year earlier. Workers involved in the steel strike were not included in these figures. (See also above, *Labor Force.*) The severest case of unemployment was in Hagerstown as a result of the cancellation of a contract by the federal government with the Fairchild Engine and Airplane Corporation. From a peak of 7,624 in 1958, employment fell 30% to 5,222 by mid-1959, resulting in some 4,650 unemployed in the county. Surplus food from the Department of Agriculture was distributed to needy persons.

The Legislative Council in November rejected the Walsh plan to give metropolitan counties more representation in the Maryland House of Delegates by increasing total membership from 123 to 141. The plan would not have affected membership in the 29-member Senate.

Governor Tawes opposed committing the Maryland delegation to the Democratic National Convention in 1960 on the basis of the Maryland presidential preference primary to be held the preceding spring.

Principal Events by: MAURICE E. O'DONNELL, *Assistant Director, Bureau of Governmental Research, University of Maryland.*

MASSACHUSETTS. New England state, United States; one of the original 13 states. The "Bay State" ranks 45th in area and 9th in population among the 50 states.

Area and Population.—Area: 8,257 square miles (land, 7,867; inland water, 390), divided into 14 counties. Population: (1950) 4,690,514; (est., July 1, 1958) 4,900,000. Towns (defining civil divisions) and cities with populations above 15,000 (as estimated by the State Division of Vital Statistics for July 1, 1958, unless otherwise indicated) are:

Arlington town	44,353[1]	Methuen town	24,477[1]
Attleboro	25,087	Milford town	15,442[1]
Belmont town	27,381[1]	Milton town	22,395[1]
Beverly	32,280	Natick town	19,838[1]
Boston (*capital*)	724,702[2]	Needham town	16,313[1]
Braintree town	23,161[1]	New Bedford	105,488[2]
Brockton	62,628[2]	Newton	87,764
Brookline town	57,589[1]	North Adams	21,493[2]
Cambridge	98,958[2]	Northampton	26,271[2]
Chelsea	36,826[2]	Norwood town	16,636[1]
Chicopee	49,071[2]	Peabody	28,015
Danvers town	15,720[1]	Pittsfield	56,103
Dedham town	18,487[1]	Quincy	84,807
Everett	45,077[2]	Revere	40,866

[1] 1950 census. [2] 1955 state census.

Executive.—Chief state officers in 1959:
Governor: Foster Furcolo (Democrat)
Lieutenant Governor: Robert F. Murphy
Secretary of Commonwealth: Joseph D. Ward
Treasurer and Receiver General: John F. Kennedy
Attorney General: Edward J. McCormack
Auditor: Thomas J. Buckley
Commissioner of Education: Owen B. Kiernan

Constitution and Judiciary.—The present constitution went into effect in 1780 and was rearranged in 1919. The highest tribunal, the Supreme Judicial Court, comprises 7 justices; chief justice in 1959: Raymond Wilkins.

Legislature.—The General Court comprises a 40-member Senate (in 1959, 24 Democrats and 16 Republicans) and a 240-member House of Representatives (145 Democrats and 95 Republicans), which meet annually commencing the first Wednesday in January.

The 1959 session adjourned on September 17 and appropriated $431,743,366, an increase of $21 million over the preceding year. Bond issues to yield $36,400,000 for capital outlays were authorized, overriding the governor's veto of nine items totaling $7,447,500. No new taxes were voted, but the governor's proposal for a withholding system of collecting state income taxes was enacted and provided $40 million for 1959 only. For the second successive time the legislature defeated a limited 3% sales tax recommended by the governor for local tax relief.

The legislature refused to adopt a subsidy plan similar to the one for $900,000 enacted the previous year, to continue passenger service of the New York, New Haven and Hartford Railroad. (See also below, *Principal Events, 1959.*) On recommendation of the governor, however, the legislature set up a Massachusetts Transportation Commission to coordinate transportation facilities throughout the state and especially to study the transportation problem of the Boston metropolitan area. The commission was also authorized to purchase the tracks and rights of way of the Old Colony Railroad for use as a future rapid transit system to the South Shore.

A bill to abolish capital punishment was rejected by the legislature, as was a recommendation by the governor to have a popular referendum on the question of capital punishment.

In a joint legislative constitutional convention the General Court took the first step toward establishing a graduated income tax, but refused a request by the governor for a specially elected constitutional convention.

Other new legislation increased the minimum wage from 90 cents to $1 per hour for general occupations; raised weekly maximum unemployment compensation from $35 to $40; extended the period for such payment from a 26-week maximum to one of 30 weeks; and boosted weekly dependency allowance under workmen's and unemployment compensation from $4 to $6.

Finance.—In the 1958–59 fiscal year, state revenue of $693,209,641 comprised $364,101,211 from state tax sources, $138,392,720 from the federal government, and $190,715,710 from other sources. Tax revenue consisted of $109,009,744 from individual income taxes, $43,079,139 from corporate income taxes, $73,011,583 from motor fuel taxes, and $139,000,745 from other sources. Licensing added $36,560,902 to state revenue. Expenditures of $657,422,523 included $70,070,461 for education, $233,251,668 for health, welfare, and corrections, and $186,651,643 for highways, boulevards, and waterways. Long-term indebtedness on June 30, 1959, amounted to $758,077,619.

Banking.—As of June 10, 1959, the state's 105 national banks had $3,866,509,000 in assets, $2,859,886,000 in demand deposits, and $509,892,000 in time deposits.

The 59 trust companies, 4 banking companies, and 186 savings banks (June 30, 1959) had assets of $8,068,767,168 and demand deposits of $7,047,103,085. There were also 175 cooperative banks and 3 savings and loan associations with assets of $1,171,151,700.

Education.—School attendance is compulsory between the ages of 7 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $241,936,671 ($309.64 per pupil), and approximate revenue comprised $203,170,000 from local school districts, $38,766,000 from the state, and $2,986,000 from the federal government. Outlays for construction and improvements amounted to $43,997,810. Salaries of teachers averaged $4,955 (high school, $5,065; elementary, $4,895).

MASSACHUSETTS SCHOOL STATISTICS, 1957–58

Type of school	No.[1]	Teachers	Students
Public elementary (1–8)	1,770	20,375	524,389
Public junior high (7–9)	129	4,751	104,152
Public senior high (9–12)	202	8,231	152,802
Junior colleges	3	73	928
Teachers colleges	10	479	7,362
Colleges and universities	...	...	125,951[2]

[1] Data for 118 consolidated schools (grades 1–12) are not included. [2] 1958–59 figure which also includes enrollment in the 3 junior colleges and the 10 teachers colleges separately listed.

Public Assistance.—In the 1958–59 fiscal year, public assistance expenditures from federal and state funds (excluding institutional costs) totaled $148,844,709, including $96,505,442 for the aged, $25,850,176 for dependent children, and $13,487,400 for the permanently and totally disabled. A monthly average of 153,051 persons received public assistance.

Labor Force.—Nonagricultural employment on July 1, 1959, was up to 1,827,700 from 1,775,800 a year earlier and above the 1,794,800 average for the 12 intervening months. Major sectors of 1959 nonfarm employment were manufacturing, accounting for 36.7% of the total; trade, 20.2%; and service industries and mining, 14.3%. Estimated unemployment on July 15, 1959, had dropped sharply to 116,500 from 168,000 on the previous July 15.

Manufacturing.—The state's 9,048 manufacturing plants in 1957 employed an average of 520,716 persons who received $1,962,753,359 in wages. Value added by manufacture totaled $5,026,952,983, and outlays for new plant and equipment amounted to $243,951,000. Production workers averaged $81.41 for an average workweek of 40.3 hours in August 1959.

LEADING MASSACHUSETTS MANUFACTURES, 1957

Industry	Persons employed	Gross wages	Value of product
Electrical machinery	51,668	$202,164,508	$1,004,873,219

Mining.—In 1958 Massachusetts ranked 41st among the states in the value of its mineral output, with 0.14% of the national total. Although output value dropped in 1958 to below that of 1957, it was only 5% below the 1956 record.

Fisheries.—Landings at Massachusetts ports in 1958 totaled 516,386,858 pounds valued at $37,158,155, a decline of 5% in quantity but an increase of 9% in value over 1957 totals. Principal species were haddock (101,329,421 pounds valued at $11,388,457) and scallops (15,946,815; $7,716,458).

MASSACHUSETTS MINERAL PRODUCTION, 1958

Mineral	Quantity	Value
Clay	84,999	$ 111,000
Coke	353,752	...[1]
Lime (open market)	139,062	2,121,000
Peat	1,014	...[2]
Sand and gravel	10,619,801	10,035,000
Stone	4,649,067	12,354,000
Other minerals	...	9,000
Total	...	$23,887,000[3]

[1] Values for processed materials are not included in the total. [2] Value included in "Other minerals." [3] Total adjusted to avoid duplication of value of limestone used for lime. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1959 dropped to $115,490,000 from $122,239,000 in the corresponding period of 1958. For the full year 1958, income comprised $111,529,000 from livestock and livestock products, $57,928,000 from crops, and $1,680,000 from government payments. Principal income sources in 1958 were dairy products, $46,092,000, and eggs, $33,638,000.

MASSACHUSETTS CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	2,512	2,400	2,700
Corn (1,000 bu.)	1,572	1,620	1,728
Cranberries (bbl.)	558,100	598,000	575,000
Hay (1,000 tons)	461	419	402
Potatoes (1,000 cwt.)	35,390*	37,250	34,606
Tobacco (1,000 lb.)	10,611	3,875	5,505

* Average, 1949–57. (Source: U.S. Department of Agriculture.)

There were 18,000 farms in 1958. Total acreage (1954) was 1,439,000, including 331,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 156,000 cattle and 4,160,000 chickens (excluding commercial broilers). Family and hired workers engaged in farming numbered 44,039 during the week of Sept. 26–Oct. 2, 1954.

Transportation and Communications.—State and federal funds spent for highways in the 1958–59 fiscal year totaled $155,912,174, and 262 miles of new construction were completed in 1958.

Highways and roads in 1959 totaled 25,694 miles, including 2,402 miles of highways and 23,292 miles of local roads; in all, 20,104 miles were surfaced. Registered *motor vehicles* numbered 1,678,233 on July 31, 1959, including 1,488,667 passenger cars. There were (1958) 9 *railroads* operating 1,682.67 line miles and (1959) 13 regularly scheduled *airlines* and 122 *airports and airfields* (51 commercial and municipal, 6 military, 58 restricted, and 7 seaplane landing areas).

Communications media (1959) included 59 AM and 25 FM *radio stations;* 4 VHF and 2 UHF *television stations;* (1958) 57 daily *newspapers* and 200 other newspapers; and (Jan. 1, 1959) 616,400 business and 1,570,400 residential *telephones.*

Principal Events, 1959.—Transportation problems continued to cause concern during the year. Acting on a proposal by Gov. Foster Furcolo in his second inaugural address on January 8, the legislature sought a solution through establishing the Massachusetts Transportation Commission (see also above, *Legislature*). Transportation difficulties were aggravated in the Boston metropolitan area on June 30 when the Old Colony Division of the New York, New Haven and Hartford Railroad ended operations. The termination of this service between Boston and South Shore communities affected some 10,000 commuters. Buses and private automobiles absorbed the displaced passengers, and completion of an expressway from downtown Boston to the South Shore eased the transition. Another cutback in railroad operations was the

cancellation of summer service between New York City and Cape Cod, announced on June 11, the day before the season's runs were to begin.

Business conditions were generally good in much of the state during the year. The electronics industry continued to flourish, and the cotton textile market experienced an upswing. Commercial and industrial construction along Route 128 near Boston continued at a brisk pace. Attracted by the wealth of academic personnel in the nearby colleges and universities, more and more firms were establishing centers for scientific research and production along the 63-mile road which has come to be known as "Space Highway." By mid-1959 more than 225 companies employing 28,000 persons had moved to the highway, and the value of new construction amounted to $137 million. On May 13–14 a $23 million research center of the Avco Corporation was dedicated at Wilmington, a Boston suburb.

The state's economy was further stimulated by the excellent weather which prevailed during the summer months. Businesses dependent on tourists generally reported successful seasons.

Some areas of the state continued to face serious unemployment. Fall River, Lawrence, Lowell, and New Bedford were included in the U.S. Department of Labor's September 19 list of major industrial areas with "chronic labor surpluses."

The cranberry industry in southeastern Massachusetts and Cape Cod, where half the nation's crop is produced, suffered a serious blow in November when the federal government reported that it had found on berries traces of a weedkiller (aminotriazole) known to cause cancer in rats. Although the announcement concerned cranberries grown in Oregon and Washington, the resulting publicity caused considerable loss to Massachusetts producers.

Massachusetts State Librarian.

MATHEMATICS. Activity in all fields of mathematics continued at a high level throughout 1959. Research produced solutions to important unsolved problems, significant progress was made in the revision of high school and college mathematics courses, and a wide range of subjects in pure and applied mathematics was studied in regular meetings and in special symposia and research institutes.

At a meeting of the American Mathematical Society in New York City, R. C. Bose, E. T. Parker, and S. S. Shrikhande announced on April 24 that they had disproved a conjecture concerning Latin squares made by Leonhard Euler in 1782. This result will have applications to the design of controlled experiments in biology, medicine, agriculture, and industry. On April 23, at the same meeting, John G. Thompson presented a solution to a problem in group theory known as Frobenius' conjecture, which was more than 50 years old. P. S. Novikov in the USSR has proved that one of Burnside's conjectures in group theory is false.

The School Mathematics Study Group (SMSG), under the direction of E. G. Begle, played a dominant role in 1959 in revising school courses in mathematics. The Commission on Mathematics published its recommendations in two volumes in the spring of 1959. SMSG held major writing sessions at Ann Arbor, Mich., and Boulder, Colo., for the preparation of sample textbooks for new courses; both writing groups comprised school mathematics teachers and college and university mathematicians.

The Ann Arbor group prepared sample textbooks for grades 7 and 8, and the Boulder group wrote sample textbooks for grades 9 through 12. These sample textbooks are being tried during 1959–60 in about 40 experimental centers located throughout the United States. The new courses emphasize not only skills but also a deeper understanding of the principles involved. In some cases the new courses provide new and modern treatments for old and familiar topics (for example, logarithms and exponents); in other cases, the new courses introduce subjects never before studied in high school. The 11th grade book contains chapters on complex numbers, vectors, and mathematical structures; the 12th grade book contains a semester's study of linear algebra.

Continued change lies ahead for the colleges; important new topics (for example, probability and statistical inference) which are being added in revised college mathematics courses are already being studied in the high schools.

At its meeting in New York City on April 23–25, 1959, the American Mathematical Society (AMS), with financial assistance from the Office of Ordnance Research, sponsored a symposium on nuclear reactor theory; also, with financial aid from Project Focus of the Institute for Defense Analyses, it sponsored a symposium on finite groups. The AMS sponsored a symposium on lattice theory at a meeting in Monterey, Calif., April 16–18, and an institute on number theory in Boulder, Colo., in the summer of 1959. At a meeting in Philadelphia, January 20–22, the society awarded its Bôcher Prize for outstanding contributions to mathematical analysis to Louis Nirenberg of the Institute of Mathematical Sciences at New York University.

A symposium on differential equations was held in Mexico City during the week of Sept. 7, 1959; it was sponsored by the National Science Foundation, the Office of Naval Research, the National University of Mexico, and the Research Institute of Advanced Science. The summer seminar in mathematics of the Canadian Mathematical Congress was held in Fredericton, New Brunswick, from August 17 to September 11; the program contained lectures on both the research and instructional levels.

The National Science Foundation supported about 80 summer institutes for teachers of mathematics in 1959. Both undergraduate and graduate enrollments in mathematics continued to increase; however, the shortage of mathematics instructors, classrooms, and offices also continues to increase. In a period of rapid growth and mounting needs, mathematics still receives relatively little support, although the Alfred P. Sloan Foundation has made grants to the California Institute of Technology for a mathematics and physics building, and to Dartmouth College for a mathematics building.

G. BALEY PRICE,
Chairman, Department of Mathematics,
University of Kansas.

MAURITANIA. The Islamic Republic of Mauritania is an autonomous republic of the French Community (q.v.), situated on the northwest coast of Africa. Estimated area, 419,229 square miles; pop. (est. 1958), 640,000, including (in 1956) 1,627 nonindigenous persons, mainly French. The national language is Arabic; the official language is French. The majority of the population are nomadic Berbers. There are few towns and none has more than a few thousand inhabitants. Nouakchott, near the coast, is the new capi-

tal; Kaédi (est. pop., 8,500) and Atar (4,200) are inland towns.

Government.—Formerly a French overseas territory included within the federation of French West Africa (q.v.), Mauritania chose the status of a member state of the French Community on Nov. 28, 1958. As an autonomous republic, Mauritania has self-rule in domestic affairs, with the Community exercising control of foreign relations, defense, currency, strategic minerals, and certain other matters. Mauritania adopted its constitution on March 22, 1959. The National Assembly consists of 40 members elected for a five-year term by universal suffrage. The premier is elected by the assembly. Mocktar Ould Daddah, leader of the Mauritanian Regroupment Party, was unanimously re-elected premier on June 24, 1959.

Education and Religion.—In 1958 there were 97 schools with a total of 6,784 pupils (7.2% of the school-age population). Expenditure on education approximated 230 million francs CFA, or about 15% of the budget. The great majority of the population are Moslems. Islam is the official religion, but freedom of worship is guaranteed.

Finance.—The ordinary budget for 1958 totaled 1,491 million francs CFA; the extraordinary budget, 136 million (the franc CFA equals 2 metropolitan francs). Funds granted by France under the Economic and Social Investment Development Fund (FIDES) were equivalent to $15.1 million in the period 1947–57.

Transportation.—Mauritania has no public railroads. Inland transport is mainly by pack caravan. Roads and trails total 2,296 miles (1956), including 862 miles of highways. Port-Étienne (pop., 1,200), on the northern coast, is hardly more than a fishing station.

Production.—Mauritania is largely desert in the interior. Cultivation is mainly along the Senegal River in the southwest. The chief occupation is livestock raising, and there are large herds of sheep and goats, cattle, and camels. Cereals include millet and maize. Other products are dates, gum arabic, salt, and fish. A large deposit of copper ore at Akjoujt is worked only on a small scale as yet, and a rich vein of high-grade iron ore was recently discovered at Fort-Gouraud. Chief exports are cattle, gum arabic, and salt. Foreign trade passes mainly through Dakar, in Senegal (q.v.), and separate trade statistics for Mauritania are not available.

Principal Events, 1959.—In the elections of May 17, 1959, the Mauritanian Regroupment Party, unopposed, won all 40 seats in the National Assembly. The party opposes union with Morocco (advocated by some elements in Mauritania), as well as federation with other African republics. Mocktar Ould Daddah, premier during Mauritania's transition from a semiautonomous territory to an autonomous republic, was re-elected premier by the assembly on June 24. French President Charles de Gaulle visited Mauritania on December 10, during his tour of the autonomous African republics of the French Community.

MAURITIUS. Ceded to Great Britain in 1814, this densely populated colony, lying 500 miles east of Madagascar in the southern Indian Ocean, comprises the island of Mauritius (area, 720 square miles) and several scattered dependencies: Rodrigues (40 square miles; pop. est., 17,018 in 1958); Diego Garcia (11 square miles; pop., 624 in 1958); the Salomon Islands (2 square miles), and other islands aggregating 45 square miles. On Dec. 31, 1958, the population numbered 632,731 (Indo-Mauritians, 414,902). Port Louis (pop., 104,016, including suburbs) is the capital and chief port.

A governor (Sir Robert Scott, appointed Feb. 18, 1954) is assisted by a 12-member Executive Council and a 55-member Legislative Council (40 elected). On March 9, 1959, a general election gave the Labour Party 23 seats, and the Moslem Committee of Action and other parties, 17.

Surplus on current accounts for 1957–58 was Rs.9,990,864 (1 Mauritius rupee = U.S.$0.21). Estimated current revenue for 1958–59 was Rs.135,777,720; recurrent expenditure, Rs.125,766,030; extraordinary and capital expenditure, Rs.68,048,144. A 5-year development plan costing £15,750,000 was inaugurated in 1957.

The government conducted 107 primary, 3 secondary, 1 teacher-training, and 1 technical and vocational schools, and aided 76 primary and 8 secondary schools (aggregating 131,588 pupils) in 1958. There were also 291 unaided schools.

Sugarcane, the principal crop, yielded 526,000 metric tons from 197,400 acres in 1958 (562,000 metric tons from 190,500 acres in 1957); production in 1959 was estimated at 580,000 metric tons. Other acreages in 1958 included tea, 3,600 (crop, 873 metric tons); aloe fiber, 14,000; tobacco, 1,000; and corn, 920. Rum, soap and matches are manufactured. Major exports in 1958 were sugar (Rs.277,115,738), molasses (Rs.4,875,066), tea (Rs.2,347,021), and alcohol (Rs.12,881). Railways aggregate 82 miles, and highways, 740 miles. In 1958 there were 12,099 motor vehicles. Steamships and Air France, Qantas Empire Airways, and South African Airways provide external communications.

MEAT INDUSTRY. Approximately 24 million cattle and 8 million calves went into the production of meat in the United States in 1959. This represented a drop of about 3% in the number of cattle and 18% in the number of calves marketed for the production of meat. The number of sheep and lambs going into the meat supply was estimated at 15.5 million, about 7% more than in 1958. The number of hogs that went into pork production was estimated at 88 million, 14% more than in the preceding year.

The decline in the marketing of cattle in 1959 was the result of farmers' and ranchers' keeping more cows and calves to build up the size of their herds. An increase in cattle numbers was expected to continue through 1960, while a large increase in the number of cattle going into the meat supply is not expected until 1961 or later. Pig births on Midwestern farms during the fall of 1959 were estimated to be about 2% higher than in the corresponding 1958 period, indicating a further increase in pork supplies in 1960.

In 1959, United States production of all meats, exclusive of lard, was estimated at 27.4 billion pounds, up about 1.7 billion pounds over 1958. Per capita consumption, estimated at 158 pounds, was up 4% over 1958.

U.S. MEAT PRODUCTION AND CONSUMPTION, 1957–59

Item	1959 prelim.*	1958 actual	1957 actual
Production:	(billion pounds)		
Beef	13.6	13.3	14.2
Veal	1.0	1.2	1.5
Lamb and mutton	.8	.7	.7
Pork	12.0	10.5	10.5
Total	27.4	25.7	26.9
Per capita consumption:	(pounds)		
Beef	80.5	80.5	84.6
Veal	5.5	6.7	8.8
Lamb and mutton	4.4	4.1	4.2
Pork	67.7	60.7	61.5
Total	158.1	152.0	159.1

* Estimates by American Meat Institute.

Production of sausage under federal inspection in 1959 was estimated at 1.9 billion pounds, or 4% more than in 1958. Canned meat production was estimated to be about equal to the 1.7 billion pounds produced in 1958.

HERBERT B. BAIN,
Director, Department of Public Information, American Meat Institute.

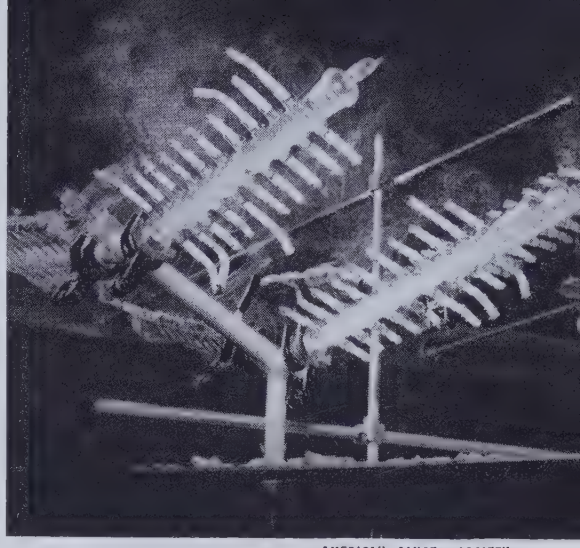
MEDICINE. The number of hospital admissions in the United States continued to increase during

1958 (the latest period for which statistics are available). The total was 23,697,000 patients, compared with 22,993,000 in 1957. Hospital operating expenses were reported to be $7,133,493,000; the greater part ($4,660,191,000) was allocated to salaries and wages. (See also HOSPITALS.) Special plans of health and hospital insurance for persons over 65 received much attention during 1959, and it was reported that more than 40% of persons in this age group had such protection at the end of 1958, with a steady increase in coverage anticipated. (See also INSURANCE—*Health Insurance.*) Other measures, such as federal legislation to provide financial assistance in the construction of nursing homes, also were introduced to improve medical care for the elderly. (See also NURSING.)

The danger of a shortage of physicians in coming years received further attention. Report of a study by the Surgeon General's Group on Medical Education indicated the need for a 50% increase in medical graduates by 1975 in order to maintain the present physician-to-population ratio 1 to 740. It was felt that 20 to 24 new medical schools would be required, with overall expenditure of perhaps a billion dollars, half of which might come from federal funds and half from state and private sources. New physicians licensed in the United States during 1958 numbered 7,809, an increase of 104 over the previous year. Included were 2,567 graduates of foreign medical schools. United States medical schools graduated 6,895 physicians in 1959. Deaths among physicians were estimated at 3,700 during 1958, and others retired because of age. A stimulus for medical research was furnished by a 36% increase in appropriations for the National Institutes of Health to $430,300,000, part of $830,661,800 allocated to the U.S. Public Health Service. (See also PUBLIC HEALTH.)

The Nobel Prize in medicine and physiology for 1959 again was shared by American scientists engaged in basic research. Two biochemists, Dr. Arthur Kornberg of Stanford University and Dr. Severo Ochoa of New York University were honored for work on the synthesis of nucleic acids, basic life substances of fundamental importance in the understanding of heredity, viruses, cancer, and other medical problems. (See separate biographical articles on each of the 1959 Nobel Prize winners.) The prize for 1958 was awarded to Drs. George W. Beadle, Edward C. Tatum and Joshua Lederberg for their work in genetics. Deoxyribonucleic acid (DNA) is believed to be the vital constituent of genes; thus the areas of research represented by the two Nobel awards are closely related and are concerned with the fascinating, broad field of biochemical genetics. The principle of "transduction" was demonstrated by the 1958 laureates, whereby genetic material, believed to be DNA, may be carried from one strain of bacterial cells to another by viruses, taking with it inheritable characteristics. With the prospect of controlled synthesis of DNA, limitless areas appear to be open for investigation in biochemical genetics and related medical fields. (See also BIOCHEMISTRY; GENETICS.)

Antibiotics.—The chief problems in connection with the widespread use of antibiotics continue to be the appearance of resistant strains of bacteria and undesirable complications from the use of the drugs. In some cases these are interrelated. For instance, resistant staphylococci may not appear until the patient has been treated for another infection with an antibiotic. Then, as other organisms are suppressed, resistant staphylococci may emerge and cause a more dangerous disease than the one for which treatment was administered. A severe form of staphylococcic infection of the intestinal tract is one of the most feared of these secondary infections.



AMERICAN CANCER SOCIETY

This laboratory device automatically puffs on cigarettes to simulate human smoking. Tars which are collected from the smoke are then painted on the backs of mice to determine the possible relationship between smoking and lung cancer.

The remarkable efficacy of a single injection of penicillin in the treatment of gonorrhea has been one of the greatest triumphs of that drug over disease. However, resistant strains of gonococci are being encountered, thus necessitating other and more complicated methods of management in some cases. Maintaining contact with patients with such infections long enough to insure complete cure often is a major problem. Sensitization to antibiotics also continues as a frequent problem in the use of these medications; hence, authorities repeatedly emphasize that antibiotics should be used only with discretion.

Success in the creation of new antibiotics has been most encouraging. Striking progress has been made in the modification and improvement of natural penicillin. The isolation in quantity of 6-aminopenicilamic acid, the basic component of the antibiotic, has been reported. This achievement has permitted the preparation, by synthesis or by combined fermentation and synthesis, of a number of modified penicillins. Many others may be anticipated. There is reasonable expectation that it will be possible to produce compounds which will be active against types of bacteria (such as many gram-negative organisms) not controlled by natural penicillin.

Relatively "nonallergic" types of penicillin may be possible. Penicillin which is active not only against bacteria but also against the enzyme penicillinase has been predicted. Some resistant bacteria manufacture this enzyme to destroy the antibiotic, and thus protect themselves from its bacteriocidal effects. One compound of the new series of modified penicillins has been introduced under the name of Syncillin. It is administered by mouth, rather than by injection, because it is so well absorbed from the intestinal tract.

New and more potent modifications of the broad-spectrum tetracycline antibiotics also have been introduced. One of these, N-(pyrrolidinomethyl) tetracycline (Syntetrin), is much more soluble than the parent substance, hence particularly suited to administration by injection. Another, demethylchlortetracycline (Declomycin), appears to be more stable in the body than its

parent substance, and therefore produces more persistent therapeutic blood levels after oral administration. (See also CHEMOTHERAPY.)

Atomic Energy.—The cessation, at least temporarily, of nuclear weapons testing during 1959 brought some relief from the anxiety concerning excessive exposure to radioactive fall-out. However, in spite of prolonged negotiations aimed at a permanent agreement to ban such tests, apparently little progress had been made by the end of the year. (See DISARMAMENT.)

The importance of protecting the population was emphasized in the United States by the creation of a cabinet-level Federal Radiation Council. It is anticipated that several agencies responsible to the council will monitor fall-out and accumulation of such substances as strontium-90 in foodstuffs.

An experimental method was described which might be used commercially to remove strontium-90 from milk, if the need should arise. The method depends upon exposure of the milk to a calcium-based exchange resin, resulting in removal of strontium to the resin, in exchange for calcium. Earlier attempts to remove strontium had resulted in loss of calcium as well, because the two elements are so closely related chemically.

Some measurements seemed to indicate that the rate of fall-out of radioactive material from hydrogen bombs is considerably more rapid than anticipated. If this is confirmed by further studies, it will be necessary to re-evaluate the rapidity with which atomic radiation may be expected to accumulate, and its expected biologic effects. It is apparent from all of the reports that mankind will be assuming a definite risk for the future welfare of the race if some means is not found for preventing the continued dissemination of artificial radioactive material in the earth's atmosphere and soil.

One of the most dangerous effects of exposure to excessive irradiation is the destruction of growing blood cells and platelets in the bone marrow. The use of transfusions of bone marrow cells in patients exposed to presumably fatal doses of irradiation has been described. In one group, bone marrow was removed from patients suffering from malignant tumors, who were to be treated with unusually heavy doses of radiation therapy. The marrow was preserved by freezing at very low temperature, and then reinfused into the individual from whom it was obtained, after completion of irradiation. There was evidence that the cells then began to grow and helped prevent the severe depletion of blood cells which would have been anticipated. It has been proposed that individuals working where exposure to irradiation may occur through accident should have some of their bone marrow preserved by freezing, against such an emergency. Marrow obtained from carefully selected donors was used to treat a group of European scientists who were accidentally exposed to huge doses of radiation. (See also RADIATION.)

Cancer.—Probably the most widespread, if not the most concentrated, scientific effort ever undertaken is being directed toward the study of malignant tumors. Many aspects of the overall problem are under investigation, ranging all the way from fundamental studies of the basic conditions of malignant cellular growth to practical methods of treating patients with cancer. Although much progress has been made, malignant tumors are second only to diseases of the heart and circulation in causing death. Deaths from lung cancer have increased at an alarming rate, and leukemia also has shown a sharp increase. A statement from the U.S. Public Health Service in 1959 again connected the increase in lung cancer with cigarette smoking. It is encouraging, however, that because of earlier diagnosis and better treatment, more patients with cancer are now being saved than ever before.

The experimental production of various malignant tumors in animals by viruses continued to receive much attention. Tumors also have been produced in animals by cell-free filtrates from human tumor tissue. Such experiments suggest the possibility that virus was obtained from human tumor. However, this has not been demonstrated with certainty, and tumor nucleic acids may be the transmitting factor. The "cause of cancer" remains a complex secret of nature, hidden in the mysteries of the fundamental processes and control of cell life and growth, probably dominated by the nucleic acids of genes. It is believed by many that viruses, with their own nucleic acids, take over the control of cellular activity in malignant tumors and direct the abnormal proliferation of the tissue. Such a concept emphasizes the close relationship between viruses, genes, and nucleic acids.

New methods of treatment are being sought constantly. Some years ago it was determined that tumors in animals were more sensitive to X-ray therapy when the animals were in an atmosphere of oxygen under increased pressure. The method was extended to human beings and encouraging results were reported from England. A specially designed unit for maintaining patients in oxygen under pressures of 3 to 4 atmospheres, while treatment with high-voltage irradiation is being administered, was scheduled to go into operation in the United States late in 1959.

Healthy individuals apparently possess immune reactions which prevent experimentally transplanted cancer cells from growing in their bodies. Protection of mice against virus-induced leukemia by pretreatment with a vaccine made from the causative virus also has been demonstrated. New attempts have been made to prepare immune serum for the treatment of malignant tumor in man by the method commonly used for the preparation of immune sera and antitoxins. Suspensions of tumor tissue were injected into horses to stimulate the production of antitumor antibodies. Serum from the horses then was used to treat the patients from whom the tumor tissue was obtained. Some beneficial results were reported.

Impetus and better organization were afforded the extensive search for anticancer drugs by the establishment of the Cancer Chemotherapy National Service Center, supported by federal funds. The center will coordinate the screening of innumerable chemical compounds for antitumor activity. Although modern attempts at chemotherapy of tumors, using derivatives of war gases, did not get under way until after World War II, literally hundreds of thousands of compounds have been examined since that time. Only a few have been found useful clinically, but some have been of considerable value. Unfortunately, all produce toxic or other undesirable effects on normal tissues which limit their use.

In the attempt to concentrate the cytotoxic effects of such chemicals in the tumor under treatment, various types of perfusion techniques have been used for fairly well localized tumors. The attempt is made to isolate the circulation to the involved area, so far as possible. A "heart-lung" machine then is used to pump blood containing a high concentration of drug through the tumor area, while limiting its access to the general body circulation. Even tumors of the brain have been treated with some success by this method. One of its more encouraging results has been in the treat-

ment of malignant melanoma, a tumor usually highly resistant to all forms of therapy. (See also CANCER.)

Heart and Circulation.—New and improved technical methods have been of great assistance in the diagnosis and treatment of heart and circulatory disorders. Machines for maintaining circulation and lowering body temperature have made possible hitherto unheard-of operations on and inside the heart. Improved techniques of heart catheterization and special X-ray methods have been of great value in diagnosis. An electrocardiographic system has been proposed which records much more elaborate data concerning the electrical activity of the heart. It is able also to scan the summation of the data while recording, and make comparison electronically with information stored in the machine from other cases in which diagnosis was known.

A device has been produced in England for automatically measuring and recording blood pressure over long periods of time. The measurements are made from a small cuff in a metal cylinder which is placed on the patient's finger. The system may be set to sound an alarm if blood pressure falls below or rises above predetermined levels. (See also ELECTRONICS.)

An effective artificial pacemaker for the heart has been devised by implanting a fine wire in the wall of the left ventricle and another electrode on the overlying chest wall. Rhythmic small electric currents cause the heart to beat under control of the mechanism during periods, especially after heart surgery, when "heart block" exists, or when there is failure of the intrinsic pacemaker of the heart. Similar devices are used to stimulate the heart through the chest wall in acute cardiac arrest, such as may follow accidental electric shock.

Evidence has continued to accumulate which indicates that intake of too much animal or artificially saturated fat in the diet raises blood cholesterol levels and increases susceptibility to coronary disease, as well as other forms of atherosclerosis. The use of vegetable oils instead of other forms of fat now is widely recommended, because of their higher content of unsaturated fats. Margarines prepared largely from corn oil and other unsaturated fats have appeared on the market. Preparations of unsaturated fatty acids and vitamins are offered for medicinal use. A new experimental drug, known as MER-29, has been tested for its ability to lower blood cholesterol levels. It is believed to interfere with synthesis of cholesterol in the body. (See also NUTRITION.)

A number of other new drugs have appeared for the treatment of cardiovascular disorders. A new antihypertensive agent, bretylium, was reported from England. Hydrochlorothiazide, a diuretic related to chlorothiazide, was found useful as an adjunct in the treatment of hypertension, as is the older drug. Further support was given to the value of streptokinase in dissolving clots in blood vessels. Considerable symptomatic relief from anginal attacks was reported by the use of iproniazid and related compounds, drugs more commonly used as "psychic energizers" in the treatment of depression. (See also HEART DISEASE.)

Hormones.—The synthesis of another complex hormone of the pituitary, the "master gland," was reported in 1959. The compound is a polypeptide, containing 13 amino acids, and has a molecular weight of about 2,000. It is said to be the largest compound of this type yet synthesized, but differs slightly from the natural hormone. The hormone is known as a-MSH (melanocyte stimulating hormone), the substance which controls pigment-producing cells in the skin. The synthesis was a by-product of a program aimed at the eventual synthesis of ACTH (adrenocorticotropic hormone). It had been learned that the 13 amino acids linked in a-MSH were the same as the first 13 of 39 amino acids in the larger ACTH molecule.

Pituitary growth hormone obtained in very limited quantities from human glands or those of monkeys is active when administered to pituitary dwarfs. However, hormone obtained from cattle (the chief source of supply of such glandular products) is not active in man, because of difference in chemical structure. Progress was made toward splitting up the larger beef hormone molecule, to obtain a compound more closely related to the human hormone, and thus useful in the treatment of growth disturbances in man.

Many undesirable effects may result from excessive or prolonged administration of adrenal cortex hormones of the cortisone type. Such medications may be needed in the treatment of children with severe asthma. However, it was reported that dosage above a certain critical level will result in retardation of growth during the period of treatment. (See also ENDOCRINOLOGY.)

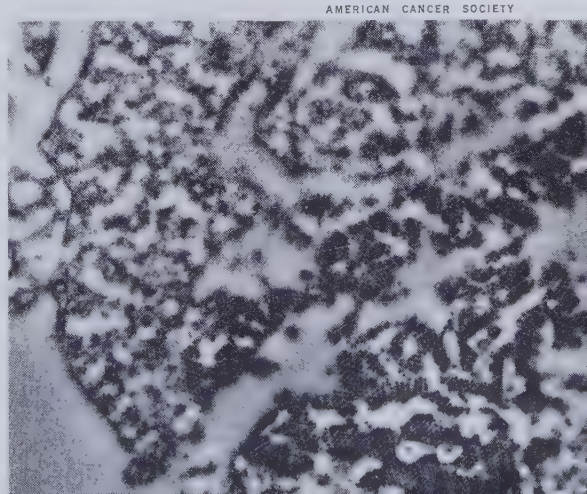
Infectious Diseases.—There was a significant increase in the prevalence of poliomyelitis in the United States during 1959. The number of cases had remained about constant in 1957 and 1958, after the use of polio vaccine became fairly widespread. However, there was an increase in 1959 to 8,278 cases, from 5,739 in 1958 (figures are through the 48th week of the calendar years). Furthermore, paralytic cases increased from 2,931 in 1958 to 5,430 in 1959.

The Public Health Service pointed out that this situation was due to inadequate use of available vaccine, especially in young children and adults, and in crowded, low-income areas. It was estimated that 65% of the paralytic cases in 1959 were in unvaccinated persons, and that only 2.5% were among individuals who had received the recommended four doses. During the scattered outbreaks of the disease in the summer months there was a temporary shortage of vaccine due to heavy demand. However, by December it was reported that millions of doses were lying unused in warehouses.

Extensive experience with several types of attenuated live polio virus vaccine has accumulated, especially in other countries where larger groups of unvaccinated people are available. Reports have been favorable, but this type of vaccine (which is

Polio virus crystals (tiny black dots) inside the human cell have been photographed for the first time by scientists of the New York State Health Department, who found that the viruses apparently are developed not in the nucleus but in the surrounding cytoplasm. The work also may help determine whether some virus types can cause cancer.

AMERICAN CANCER SOCIETY



given by mouth) has not been licensed for use in the United States, pending further study. One important question to be answered concerns the possibility that attenuated virus might regain virulence as it is transmitted from individual to individual. Preliminary reports indicate that such change has not been observed.

True to expectations, additional viruses have been found associated with respiratory infections. So-called Eaton viruses were found in cases of atypical pneumonia, long suspected of being a viral disease, as well as other illnesses. Hemagglutination or para-influenza viruses, first isolated in 1958, were found to be a frequent cause of respiratory infection in children and perhaps of coldlike symptoms in adults. Another group of respiratory and intestinal tract viruses were given the name "reoviruses." Attempts to prepare a vaccine to protect against respiratory infections are complicated by the multiplicity of agents involved.

An epidemic of eastern equine encephalitis, a viral infection, occurred in southern New Jersey in the late summer and fall of 1959, with a total of 21 deaths recorded. By early October, the trial of an experimental vaccine against the disease was reported.

The speedy recognition and identification of specific viruses, bacteria, and other infectious agents has been aided by refinement of the fluorescent antibody technique. It was observed some years ago that antibodies could be treated with fluorescent dye, thus rendering them readily detectable under the microscope when illuminated with ultraviolet light. Immune serum containing antibodies against the specific agent in question is prepared. When added to material such as secretions or tissues containing the specific infectious agent, antibodies immediately combine with the organisms. With fluorescent antibodies, the characteristic reaction may be recognized under the microscope. The technique has many possible applications and may permit presumptive diagnosis in some infections days or weeks earlier than would be possible with conventional methods.

An increase of approximately 50% in the incidence of infectious (viral) hepatitis was reported for the first half of 1959. There also was a 20% increase in diphtheria, a disease subject to complete control by preventive immunization of children. (See also PEDIATRICS; PUBLIC HEALTH; RESPIRATORY DISEASES.)

Nervous System.—Various chemical abnormalities in the blood and urine have been reported in recent years in patients with mental disorders, particularly schizophrenia. Now it has been determined that at least some of these may be more apparent than real, and may be due to variations in dietary pattern of the ill persons.

Further reports have appeared concerning the use of an extract of the pineal gland for the treatment of schizophrenia and other mental illnesses. A protein-free extract of beef pineal glands has been prepared and is said to produce both biochemical and behavioral changes in mental patients, but to be without effect on normal or neurotic individuals. The nature and mode of action of the active material are not known. The significance of these reports remains to be determined.

Considerable attention has been directed to the treatment of depressed states with "mood-elevating" or "psychic-energizer" drugs. Several new compounds of this type have been introduced and are reported to give good results in properly selected patients. The flood of new "tranquilizers" has continued, with the introduction of some compounds of much greater potency than the earlier drugs of this type. Most of these compounds are phenothiazine derivatives. (See also NERVOUS SYSTEM; PSYCHIATRY AND MENTAL HEALTH.)

Duke University School of Medicine.

MELLON INSTITUTE. The independent research program (fundamental scientific investigations) of Mellon Institute (4400 Fifth Avenue, Pittsburgh 13, Pa.) gained strength in 1959 through growth of staff and from substantial contributions to knowledge. In applied science research, sponsors are nurturing long-range investigations, with growing emphasis on creative research in areas of significance. A plan has been developed for industrial affiliation with the institute's fundamental research. That research has attracted increasing support from government agencies. Construction of two new buildings has been completed, and the laboratories have been occupied.

Independent Researches.—Properties of certain enzymes (esterases) have been studied. Under research are the mechanism of enzymatic hydroxylation and modified fibrous proteins. Studies in the inorganic field have included the coordination chemistry and unusual oxidation states of transition metals. The chemistry of osmium has had main attention. Research on natural and synthetic macromolecular substances has continued. Stress-temperature measurements have been made on fibers prepared from muscle. Several papers have been published on mechanical breakdown of fibers. Other activities relate to synthesis of molecules of known structure and correlation of physical properties with chain architecture. Thermodynamics of dilute polymer solutions is under investigation.

Other projects are concerned with crystalline imperfections of metals, phase transformations in metals and alloys, and lattice spacings of intermediate alloy phases. A study with medical specialists, on corrosion of metals in living tissues, has yielded information to furnish statistically important differences in corrosion resistance among metals implanted in flesh. In research on corrosion implants in bone, levels of trace elements in normal rabbit bone have been established.

Investigations are active in structural organic chemistry. A nuclear magnetic resonance method has demonstrated that there exists in cyclic sulfite esters stereoisomerism of a type previously only suspected. Nuclear magnetic resonance spectroscopy is a new, powerful technique aiding in the solution of many organic analytical problems. Under way are high-resolution infrared absorption measurements at temperatures as low as 4.2°K. on the photolysis products of ammonia and other compounds. Another project deals with the infrared and Raman spectra of inorganic molecules and ions. Studies in radiation include decomposition of hydrocarbons, kinetics of photochemically produced free radicals, and radiation-induced cross-linking of polymers in solution.

Applied Researches.—Investigations of the physical state of new alloys and high-temperature materials are important aspects of long-range research. There is a study of kinetics and thermodynamics of reactions between gases, metals, and slags. A project is evaluating ferrous alloys for high strength at elevated temperatures. From another undertaking, a new ultrahigh-strength steel for missiles has been developed.

Researches of concern to the public have given valuable results. This fact is brought out in accomplishments in air-pollution control, studies of food additives, researches in occupational health,

researches into the nature of the synergism that exists between silicosis and tuberculosis, and the program on water-pollution abatement. The influences of nonphenolic compounds on flavor of drinking water have been studied, and methods for separating suspended solids from waste water constitute another project.

A ceramic program embraces viscosity and surface tension characteristics of porcelain enamel. Structural clay products studies pertain to heat distribution in kilns and physical and chemical processes that occur in clays during firing. Computer components research encompasses techniques associated with fabrication of miniature, essentially two-dimensional printed circuitry. Sectors of this work have been successfully concluded.

Applications for proteins and starches derived from corn have been found as paper and textile coatings. In foods, emphasis has been directed toward new processing methods, and identification and preservation of natural flavors. Another fellowship has devised a mixture of synthetic fibers with outstanding characteristics applicable to life jackets. Exceptionally good permanent softeners for attaching resins to cotton have been discovered.

Among other research projects, dibasic acid and orthosilicate esters have been upgraded as lubricants. A better understanding of constituents has come from a study of emulsion paints. Research on polyethers has benefited the polyurethane foam industry, and researches in petroleum have been concerned with chemistry of petroleum genesis, combustion chemistry, and catalysis.

MERCHANT MARINE, U.S. There were 937 vessels of 1,000 gross tons and over in the active oceangoing United States merchant fleet on Sept. 1, 1959, or eight more than were in the active fleet on Sept. 1, 1958. The total United States merchant fleet, active and inactive, consisted of 3,097 vessels, or 29 less than the total of a year earlier. The decrease was accounted for by a drop of 43 ships in the government-owned fleet, due for the most part to the scrapping of old Liberty ships from the National Defense Reserve Fleet. This fleet numbered 2,039 vessels on Sept. 1, 1959, as compared with 2,088 on Sept. 1, 1958. About 900 of the ships in the fleet had been selected for retention as a nucleus for emergency use; the remainder are to be scrapped over a 10-year period.

The total privately owned merchant fleet increased by 14 ships; 24 ships were returned from foreign to United States registration, and 22 new ships were delivered into service, while 6 ships were transferred to foreign flags, 19 were traded in to the government, and 7 were lost, scrapped, or otherwise disposed of.

Large oceangoing ships under construction or conversion in United States shipyards on Sept. 1, 1959, numbered 74 vessels with a total weight of 1,803,746 deadweight tons and an estimated value of $785 million. Of these, 68 were new ships, including 1 combination passenger and cargo vessel, 37 freighters, 28 tankers, and two special types. The total number was a decrease from the 99 ships being built or converted on Sept. 1, 1958, which totaled 3,056,079 deadweight tons and were valued at over $1 billion.

During the year ending Sept. 1, 1959, 50 ships were completed, of which 3 were passenger-cargo ships, 4 were Great Lakes bulk carriers, 27 were tankers, and 16 were conversions. Of those delivered, 10 tankers were for foreign-flag operators. Orders were placed during the year for 30 ships, including 20 new freighters, 1 tanker, 1 barge, 1 ferry, and 7 conversions; and 5 tanker orders were cancelled.

The world's first nuclear-powered merchant ship, the N.S. (Nuclear Ship) *Savannah*, was launched on July 21, 1959, and was scheduled to be delivered in 1960. (See also Atomic Energy.)

The long-range replacement program agreed to by United States shipping companies receiving government help was well under way. Of the 293 vessels to be built by 14 companies in the next 15 to 20 years at a total estimated cost of about $4.6 billion, 4 ships had been delivered, and 34 were under construction in 1959. As the new long-range replacement ships are built, the superseded vessels are traded in to the government and placed in reserve, thus improving the quality of the reserve.

In addition to the nuclear ship and the conventional types of ships thus far ordered in the replacement programs, research was being carried on by the government in conjunction with several private firms to build new types of ships such as underwater cargo and tanker ships and passenger and cargo-carrying hydrofoils which would skim over the water at high speeds. Also, research was being conducted on advanced navigational and safety devices that would make merchant ships of the future safer and more economical to operate. (See also Shipbuilding.)

The percentage of United States waterborne foreign trade carried by United States flag ships continued to decline during 1959. However, with the opening of the St. Lawrence Seaway (q.v.) in the spring of 1959, two United States companies started to offer service from the Great Lakes, one to the Caribbean and the other to the Mediterranean. Applications from six other companies to provide Great Lakes shipping service with government aid were under study.

Eight previously unsubsidized United States flag operators had applied for government assistance in offering regular shipping services. Under the Merchant Marine Act of 1936, as amended, the government may assist companies to provide service on foreign trade routes which have been determined to be essential to national trade and defense by paying the difference between United States costs of operation and costs of foreign competitors on the same routes. Similarly, the government may pay the difference between domestic and foreign costs of building ships for United States foreign trade in order to provide work for shipyards and shipbuilding workers deemed essential to the nation's security.

MERCHANT FLEETS OF THE WORLD

(Oceangoing steam and motor ships of 1,000 gross tons and over, as of Dec. 31, 1958.)

Country	No. ships	Dwt. tons
World total	16,966	158,047,000
United States:		
Privately owned	1,007	13,429,000
Government owned	2,054	20,223,000
United Kingdom	2,522	24,372,000
Liberia	1,020	17,790,000
Norway	1,288	14,142,000
Japan	870	7,723,000
Panama	546	6,609,000
Italy	718	6,503,000
West Germany	866	5,660,000
Netherlands	580	5,465,000
France	624	5,398,000
Others	4,871	30,733,000

Clarence G. Morse,
Maritime Administrator.

MERCURY. World production of mercury in 1958 totaled 248,000 flasks (of 76 pounds each),

representing an increase for the tenth successive year. A 7% drop in output in Italy, caused by work stoppages at the large mercury-producing mines, was more than compensated for by increases in Mexico, Peru, and the United States.

Production in the United States in 1958 rose by 10% to 38,067 flasks, compared with 34,625 flasks in 1957, according to the U.S. Bureau of Mines. This was the largest output since 1883, except for 1941–43, and constituted 15% of world production in 1958, compared with 14% in 1957. Domestic production in the first nine months of 1959 was 23,490 flasks. The number of mercury mines in 1958 dropped to 101, from 120 in 1957. California continued to be the leading mercury-producing state, with 59% of the total; Nevada ranked second, with 19% of the total; Alaska, third with 9%; Idaho, fourth with 7%; and Oregon, fifth with 6%. Imports of mercury for consumption totaled 30,158 flasks in 1958, compared with 42,005 flasks in 1957. (See MINERAL PRODUCTION for table showing output by major producing countries.)

MERCURY, Project. See NATIONAL AERONAUTICS AND SPACE ADMINISTRATION; SPACE FLIGHT.

METALLURGY. Metal Production.—Although the iron blast furnace has been the standard method of iron production for more than a century, at least 15 direct-reduction processes are now receiving attention in the United States. Direct-reduction processes are particularly attractive for treating concentrate from low-grade ores, where coke is expensive, or where there is not sufficient market for the output of a large, efficient blast furnace. Direct-reduction processes have been in commercial use for some years in other countries; and in the United States, several processes are in the pilot plant and semicommercial stages.

The Republic Steel Corporation, in conjunction with the National Lead Company, has developed a rotary kiln process for reducing iron ores. The R-N process has been used to treat over 120,000 tons of low-grade Clinton ore in a Birmingham, Ala., plant. (The Clinton ore is nonmagnetic and could not be concentrated by usual processes.) The reduced iron is collected by magnetic concentration and briquetted. Over 8,000 tons of R-N sponge iron briquettes have been successfully used in electric steelmaking furnaces.

Republic Steel is also developing a direct-steel process in which a bed of high-purity magnetite concentrate is passed through a reduction furnace on a traveling grate. The hot sintered iron is stripped from the grate and rolled to usable sheet steel in one continuous operation.

Three fluidized bed processes are being developed for reducing iron ore concentrates with hydrogen or with hydrogen and carbon monoxide: the Esso–A. D. Little process, the Nu-iron process of the United States Steel Corporation and the H-iron process of Bethlehem Steel and Hydrocarbon Research. The H-iron process appears to be the nearest to commercial operation; it is being operated at a pilot plant in Trenton, N.J., and in a small plant for the production of iron powder at the Alan Wood Steel Company. Bethlehem Steel in 1959 was constructing a semicommercial H-iron operation at its Los Angeles, Calif., steel plant. H-iron is expected to solve the problem of a reliable supply of raw material for electric furnace steelmaking on the Pacific coast.

Oxygen steelmaking production capacity in the United States has quadrupled in the past year. Early in 1959 an L-D oxygen vessel was started at the Kaiser Steel Corporation's Fontana, Calif., plant. There are now five plants in the United States and Canada using the oxygen steelmaking process. Present annual capacity in the United States is more than 4 million tons, and a capacity of 15 million tons is expected within the next few years. (See also IRON AND STEEL.)

Electron Beam Techniques.—The heat produced by the impact of a high-velocity stream of electrons on metals is being used commercially to melt and refine and to cut and weld metals. Electron beam work is expensive, but refining by vaporization, avoidance of contamination, and the ability to concentrate energy and produce extremely steep temperature gradients justifies its use with refractory metals and for other special operations.

Explosive Forming.—Explosive forming is being used commercially for the forming of metal parts for the missile industry. Metal shapes which cannot be satisfactorily fabricated by conventional means because of large dimensions, high strength of material, or limited quantity requirements can be fabricated by explosive forming with a very low investment in equipment. Relatively slow-burning explosives are used in low-pressure forming. The gases are contained and used to force the workpiece to the configuration of the die. In high-pressure forming an open die is used and the energy from a high explosive is transmitted by an intermediate medium, such as water, to force the workpiece into the die. Low-pressure work is safer but more expensive, as closed dies must be used.

New Alloys.—A new aluminum alloy (designated X-2020) which contains lithium has been developed by the Aluminum Company of America. The alloy was developed for the next generation of civilian aircraft, which will encounter aerodynamic heating. As compared with conventional aluminum alloys, the new alloy is 3% lighter and has 8% greater elastic stiffness. It will maintain good strength up to 400°F., which is 100°F. above the temperature limit of other aluminum alloys.

A new steel containing 9% nickel has been announced by the International Nickel Company of Canada, Ltd. It was developed to provide a moderately priced material for subzero service. It can be heat-treated to produce ferrite and austenite, a very stable, high-carbon metal with high ductility at low temperatures. The 9% nickel steel is also suitable for carburizing. High surface hardness, with minimum distortion, can be obtained by slow cooling from the carburizing operation.

Professor of Metallurgy, Stanford University.

METALS. See CHEMISTRY; METALLURGY; MINERAL PRODUCTION; MINERALOGY; MINING.

METEOROLOGY AND CLIMATOLOGY. The weather patterns of the seasons from autumn 1958 through summer 1959 were as follows:

Autumn 1958.—September through November was slightly warmer than average over the entire area of the 48 contiguous states of the United States. The greatest anomalies (over 4°F.) were noted along the southern California coast. November, in particular, was an abnormally mild month but ended with heavy storms and blizzards in the northern Great Plains. Rainfall was quite deficient in the Prairie states but abundant in southern Texas.

Winter 1958–59.—December through February was colder than average from the Rockies to the Atlantic seaboard. Especially in the Great Lakes region this was an old-fashioned winter with abundant snowfall. December was in many areas of the Northeast the coldest since 1917; February was considerably milder. The Western states had at the same time temperatures of 4° to 6°F. above the average. Precipitation was deficient in the Southwest, in northern Wisconsin, Minnesota, and North Dakota, but Florida and the northern Mountain states had excessive amounts. January floods caused damage in Ohio and Pennsylvania. In other countries, droughts prevailed in Queens-

land, Australia, and in Brazil and Ghana, but heavy January rains caused a disastrous dam break in Spain.

Spring 1959.—March through May was fairly warm and late frosts were rare. The southern California temperature anomaly (of over 4°F. warmer than average) persisted. There were slightly above-average temperatures in all parts of the United States except the Northwest, which was slightly cooler than seasonal. Rainfall was most deficient in the Southwest and the northern Plains, but parts of Nebraska, Iowa, and central Florida had over twice their average amounts. In March, storms of hurricane intensity caused many casualties on Bahrein (in the Persian Gulf) and in the Malagash Republic (Madagascar), and left tens of thousands homeless. April floods ravaged parts of Argentina, Uruguay, and Brazil.

Summer 1959.—June through August was warm over most of the United States. Only the northwest corner and parts of the southern Great Plains had below-average temperatures. The Northeast was particularly hot toward the end of June and in August, when many new heat records were set. Rainfall was very heterogeneous during the season. The Texas-Oklahoma-Arkansas area and the northern Great Basin received over 50 per cent more rainfall than average. Serious deficiencies of precipitation occurred in Montana, the Dakotas, and the central Great Plains. Warm weather and adequate rainfall in the Middle West led to a bumper corn crop. The Pacific region and the Far East were plagued by an unusually large number of typhoons and excessive rainfall. China suffered devastating floods in Kwangtung and Kwangsi provinces. Hong Kong received nearly 30 inches of rain in four days, and thousands were made homeless. Korea and Japan also suffered severely.

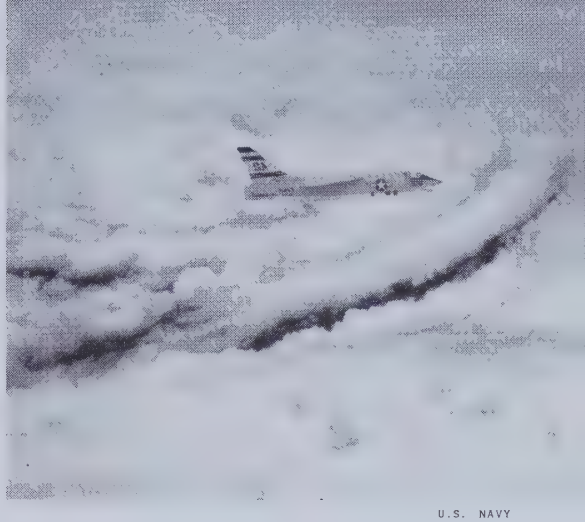
Storms.—Severe storms in the United States in 1958 included 565 reported tornadoes, which caused 66 deaths and $28 million damage. (These figures show a considerable reduction from the preceding year.) Other windstorms resulted in 129 fatalities and property damage exceeding $100 million. The 10 tropical storms of the Atlantic and Caribbean caused only two deaths in the United States but 47 in the Caribbean area. Property damage of $12 million on the mainland was also considered very moderate in comparison with other years. (For a record of severe storms in 1959, see the entry *Accidents and Disasters—Hurricanes, Tornadoes, and Typhoons*—in Part 2 of the CHRONOLOGY at the front of this volume.)

Technological Progress.—New methods of meteorological observations dominated research in this field in 1959. Most exciting were the attempts at observing the earth's atmosphere from above. Several Nike-Cajun rockets obtained cloud-system pictures, which were recovered at sea from ejected capsules containing a homing beacon. The most interesting cloud pictures, obtained from an Atlas missile fired to a height of 700 miles on Aug. 24, 1959, covered the Caribbean and parts of the east coast of North America and showed a frontal system (see illustration on page 471).

Other rockets have been developed to eject parachutes or balloons carrying rawinsondes at heights of 35 to 50 miles. A few successful test flights have been accomplished, but much development work is needed before routine operations can be expected. These rocket sondes are bridging an important gap in atmospheric observations between conventional balloons and satellites.

A balloon altitude record was announced on Feb. 11, 1959, by the U.S. Army Signal Corps. A neoprene balloon, launched at Fort Monmouth, N.J., expanded from 10 feet to 65 feet in diameter as it rose to an altitude of nearly 28 miles. The coldest temperature it recorded was −85°F. at 10 miles; at the top of the flight the temperature had increased to 40°F.

The first weather satellite, also instrumented by the Signal Corps, was successfully launched on Feb. 17, 1959, as Vanguard II (or 1959 Alpha) from Cape Canaveral, Fla. Two photocells aboard were designed to measure the intensity of sunlight reflected from the earth, and to distinguish between large cloud layers with 80 per cent reflection, land areas with 15 per cent, and sea areas with 7 per cent reflection. Unfortunately, the satellite acquired a complex wobbling motion which has made the reduction of data virtually impossible. Explorer VI, launched on Aug. 7, 1959, also carried a cloud cover experiment. Data were transmitted from a crude television scanning device. (See also SPACE FLIGHT.)



U.S. NAVY

Navy Crusader plane flies over the eye of hurricane Gracie, which struck South Carolina on September 29. Eye of the storm is visible directly above plane's tail in photograph.

Hurricane Research.—Numerous soundings taken of hurricanes have shown high temperature excesses in the core at all levels above the surface. This warm core widens with height, increasing from 20 to 30 miles at 15,000 feet to 100 or more miles at 30,000 feet. The greatest temperature excess of about 10°F. is in the mid-troposphere. A study of Pacific typhoons has shown that one of the important breeding grounds is west of a semipermanent low pressure trough in the upper air. This trough, at 40,000 feet, is located at longitude 170°W., and the origin of the tropical storms is upstream at longitudes 125°–145°E.

New systems are being developed to track and measure hurricanes. Among them is the balloon-borne radio beacon dropped by reconnaissance planes into the eye of the storm, where the circular wind system will retain it for a while. In the first successful flight of this device, made during hurricane Helene of 1958, the beacon stayed in the eye and was tracked for nearly two hours before the batteries gave out. It was employed again successfully during hurricane Hannah in October 1959.

Japanese scientists have developed automatic wind-measuring stations for coastal use, which

Driven by the 125-mph. winds of hurricane Gracie (September 29), heavy sea lashes the Charleston, S.C., waterfront.

UPI

transmit hourly data on speed and direction. More elaborate is the U.S. Navy's automatic weather station which has survived mooring tests in water over 12,000 feet deep. One station in the Gulf of Mexico transmitted, while unattended, 6-hourly observations of pressure, wind, and air and water temperatures for over two months.

Polar Weather.—Far from being quiescent in the winter night, much weather activity takes place in the polar regions during the sunless period. Low pressure systems in the Arctic outnumber highs by about 2 to 1. Although anticyclones are fairly frequent over Greenland, which has been pictured as the seat of a glacial anticyclone, they are even more frequent over the Yukon. In Antarctica a low pressure circulation center exists in the higher stratosphere near the Pole of Inaccessibility (latitude 82°S. and longitude 55°E.). Cyclones pass even in winter over the South Pole, accompanied by temperature changes of as much as 37°F. A secular temperature rise of a little over 4°F. has been noted since 1911, when the first observations on the Antarctic continent were made. This compares with an increase of well over 5°F. in the Arctic during the same period. (See also ARCTIC EXPLORATION.)

Atmospheric Admixtures.—Much was learned during the International Geophysical Year (IGY) about radioactive fall-out of materials resulting from nuclear explosions. Dry fall-out is three times as heavy as the wash-out of materials through precipitation. Deposition speeds are close to one inch per second.

Carbon dioxide, which has been suspected as an agent causing recent atmospheric warming, showed very little variability in the Antarctic, on Mauna Loa in Hawaii, and over the oceans. The undisturbed value of this gas in the air appears to be 312 ppm. (parts per million); in Sweden a range of 250 to 400 ppm. was noted. From the dilution of the carbon-14 in the natural carbon dioxide by that gas derived from fossil fuel, which is bare of carbon-14, an 8 per cent increase in total carbon dioxide in the atmosphere has been calculated.

Excellent ozone observations also were obtained during the IGY. At Mauna Loa the range of the gas was from 20 to 100 micrograms per cubic meter of air; the highest concentrations were noted in April, the lowest in October. In the Antarctic the mean concentration was 64 micrograms per cubic meter, but the highest values were noted in midwinter (May–August) and the lowest in February and March just before the disappearance of the sun. In the Canadian Arctic, measurements of total ozone in the atmosphere were made during the arctic night by spectroscopic study of sunlight reflected from the moon. These observations support the view that a marked increase in ozone is coincident with the abrupt end of the arctic winter temperatures in the stratosphere.

Cloud Physics.—Observations show that the liquid water content of precipitating convective clouds exceeds 3 to 4 grams per cubic meter. When the water content drops below 2 grams per cubic meter the clouds are dissipated. The size of cloud droplets is directly related to the number of small condensation nuclei; the more nuclei, the smaller the droplets. The presence of fewer nuclei and larger droplets predisposes to better coalescence and precipitation. The largest droplets are generally found in air of maritime tropical origin; the smallest, in polar continental air.

Snow shows characteristic crystal forms, depending on the temperature, as follows: 32° to 27°F., thin hexagonal plates; 27° to 23°F., needles; 23° to 16°F., hollow prisms; 16° to 10°F., hexagonal plates; 10° to 3°F., dendritic stars. Volcanic eruptions in Japan, especially of Mount Asama, have brought into the air large numbers of freezing nuclei, which are suspected to have caused significantly heavier rainfall downwind during periods of activity. Clay minerals, which are quite active as freezing nuclei once they are activated by a thin layer of ice, are likely to be the most common natural freezing nuclei.

A very important laboratory discovery was made by H. M. Papee of Ottawa, Ontario. He found that ordinary salt, when treated by X-rays, radiofrequency discharges, or corona discharges, shows blue discoloration, a result of colloidal sodium in the outer strata of the crystal lattice. The blue salt will absorb water much more readily than ordinary salt; hence, it constitutes a very active condensation nucleus. It has also been found to act readily as a freezing nucleus. Because salt originating in the ocean is present in many parts of the world, and because electrical discharges are equally common, blue salt may well be a very prevalent natural rain inducer.

Little new knowledge on artificial weather modification has been acquired. University of Arizona scientists have been seeding orographic cumulus clouds with silver iodide for two years. Radar echoes show statistically significant results in changing the small cloud drops to raindrops. The USSR has for the first time officially announced cloud modification experiments. Soviet scientists successfully used dry ice to open up airfields blanketed by fog composed of supercooled droplets. Silver iodide, which is often used as a cloud seeding agent, can also be used as a tracer of air currents in which it is dispersed. Downstream from the generator, tests for freezing nuclei by the conventional counting chamber can trace the air trajectories.

Hail-suppression experiments by Austrian and Swiss scientists using silver iodide, dispensed both by rocket and ground generators, showed no conclusive evidence of interference with hail but apparently caused increases in precipitation upslope from the sprayers. French observations of destructive hailstorms in the Pyrenees indicated that the presence of a jet stream or strong wind aloft is an associated condition. No such coincidence could be found in hailstorms in the United States.

Upper Atmosphere.—Analyses through stereoscopic photographs of drifting luminous clouds produced by vaporized sodium ejected from rockets have yielded wind data up to a height of 125 miles. In the three cases observed up to late 1959, the strongest winds (with speeds from 200 to 400 miles per hour) were noted between 50 and 70 miles up. At the higher levels the wind slowed to 50–90 mph. The wind directions were primarily from southwest to northwest.

Much information on temperatures in the high atmosphere has been accumulated from the earth satellites. At a height of 150 miles, higher values were noted in the daytime than at night, and also in polar than in equatorial regions. It is assumed that these differences are caused by interaction of terrestrial magnetic fields with corpuscular streams from the sun. Anomalies in these streams cause magnetic storms which are believed to have influences on terrestrial weather. Thus, in the winters of 1956–57 and 1957–58, about three days after magnetic disturbances, low-pressure troughs at the 30,000-foot level in the Alaska-Aleutian area developed into particularly large weather disturbances. This type of solar-terrestrial relation prompts a continuing search for other connections.

Ultraviolet radiation and X-rays from the sun were measured at heights of 50–150 miles by rockets fired from the U.S.S. *Defiance* near the Danger Islands in the South Pacific during a solar eclipse on Oct. 12, 1958. In the complete lunar shadow the ultraviolet disappeared but the X-rays persisted, suggesting that the sun has an X-ray halo. Another check rocket, fired after the eclipse, reached its peak altitude while an intense solar flare was in progress. The X-ray flux at that time became strongly enhanced. Absorption of these solar rays in the outermost layers of the atmosphere is at least partly responsible for the high temperature inferred from data sent back by satellite Explorer IV. The satellite recorded these height-temperature relationships: 100 miles, 700°F.; 150 miles,

1,100°F.; 200 miles, 1,500°F.; 250 miles, 1,800°F.; 300 miles, 2,100°F.; 350 miles, 2,400°F.

Climatic Change.—Of great importance to the theory of climatic changes is the claim of researchers at the Lowell Observatory in Flagstaff, Ariz., that the solar constant, or total radiation emission of the sun as received at the outer layers of the earth's atmosphere, is increasing. This was deduced from observations of the reflected sunlight of the planets Uranus and Neptune. From 1952 to mid-1958, this increase was estimated to be 2 per cent of the total solar radiation.

The high temperature anomalies of the Pacific Ocean surface off the west coast of the United States pose a new puzzle. Changes in the atmospheric circulation have caused increased advection of warm water from the south, which has reduced the usual upwelling of cold bottom water. The high water temperatures have caused the warming of the air masses, and there is a tendency for reduced cloudiness and hence an increase in solar radiation. Some meteorologists believe that this may lead to a perpetuation of the anomaly.

Radar Meteorology.—Radar has added immensely to the weather forecaster's instrumental arsenal. A radar reflective balloon for upper wind measurements has been developed which replaces the balloons with attached reflectors by having an inside coating of small aluminum dipoles. This reduces the drag and only slightly increases the height of the balloon. As the balloon expands upon rising, the reflective target area grows with it, improving the accuracy of observations.

Severe storms are characterized by bright radar echoes. The center of greatest radar reflectivity is usually seated between 15,000 and 20,000 feet, but the most severe storms show echoes at heights greater than 45,000 feet. In tornado situations, a wavy pattern is sometimes observed to form in the radar echoes caused by an approaching squall line. Tornadoes are most frequently observed just east of the apex of the wave or in the squall line to the southwest of it. Some tornado cyclones have been noted to extend to at least 30,000 feet high and may even go to 36,000 feet.

When radar echoes extend above 30,000 feet, the probability of hail occurrence increases rapidly with echo height. In New England over one third of the storms observed with echoes over 45,000 feet high carried hail. Lightning and hail also seem to be closely correlated. When lightning has shown a frequency of less than 10 strokes per hour, no hail has been reported. Hail nearly always occurs, however, in storms with lightning strokes numbering more than 100 per hour. Not all weather radar echoes result from clouds or precipitation. Cloudless cold fronts also give reflections, caused by changes in the index of refraction due to mixing of air masses of different temperature and moisture content in the frontal zone.

Aircraft accidents show that the danger from thunderstorms is still underrated. Measurements have shown updrafts of 220 feet per second and downdrafts of 140 feet per second in thunderstorms. Pilot reports indicate elevation changes of as much as 6,000 feet in 30 seconds, accompanied by severe turbulence.

Organizations.—In April 1959 the third World Meteorological Organization Congress met in Geneva, Switzerland. This specialized agency of the United Nations now has 103 member states and territories with weather services (Iran was admitted as the 103d member in October 1959). Coordination of the exchange of weather information has been greatly advanced by this cooperative effort. The World Meteorological Organization prize for scientific research was awarded in 1959 to Dr. Jacob Bjerknes, of the University of California at Los Angeles.

In the United States, 12 universities, stimulated by a report of the National Academy of Sciences—National Research Council, have formed the University Committee on Atmospheric Research. The purpose is to establish a joint institute which will provide the large facilities needed for advanced research in this field. Congress has appropriated funds for the National Science Foundation to conduct a survey of the feasibility of such an institute.

GENERAL ELECTRIC COMPANY

Photograph taken from an altitude of 250 miles during flight of Atlas missile fired on August 24 shows a large weather front forming off the Atlantic coast of the United States.

METHODIST CHURCH. Special stress was placed on evangelism and higher education during 1959. Reversing the usual process, a team of ten preacher-evangelists from lands to which American Methodists have been sending missionaries toured United States churches on a preaching mission in October and November. Similarly, American Methodist ministers and laymen made evangelistic visits to Malaya, the Philippines, Japan, and Central America. In the United States in October, 400 Methodist ministers from 40 states assisted the pastors of Southern California in a week's campaign of visitation evangelism.

Continuing for the 14th year an international postwar scholarship project, the church, during the 1959–60 college year, supported 110 students from overseas in 34 colleges and hospitals in the United States. Seventeen other scholarship students were studying in universities in other countries. In Anchorage, Alaska, the cornerstone of the Alaska Methodist University was laid on July 12. The college will open to 450 students in September 1960.

An indication that the shortage of ministers may be slackening is suggested by the record number of students graduated in 1959 from the 10 Methodist theological seminaries. Degrees were granted to 680, an increase of 86 over the previous year; enrollment was up 10%. Two new graduate schools of theology will help meet the need for additional clergy—the National Methodist Theological Seminary in Kansas City, Mo., which opened in September 1959, and the Methodist Theological Seminary in Worthington, Ohio, which is to open in September 1960. The cornerstone was laid on June 15 for a $5 million plant for the Southern California School of Theology in Claremont.

Methodists held three nationwide meetings during the year. One, the National Town and Country Conference, met in Wichita, Kansas, July 21–24. Here, reports were made on the religious beliefs of Methodist laymen and ministers. Also studied were plans for group ministries, whereby several pastors are giving the benefit of their special talents, not to one congregation, but to a group of associated congregations.

A National Convocation of Methodist Youth met at Purdue University, August 24–28, with 6,000 attending. Such questions as world peace, race relations, and the attainment of worship values through drama and jazz were discussed.

An innovation, a Conference on Human Relations, brought 1,000 to the campus of Southern Methodist University, September 1–4. Delegates explored what Christians can do toward bettering race relations in such tension areas as the church, education, housing, and employment.

A new monthly magazine, *Music Ministry*, began publication in Nashville, Tenn., in October, with the Rev. V. Earl Copes as editor. The periodical is part of the general movement for the improvement of church music sponsored by the Na-

tional Fellowship of Methodist Musicians. Also in October, *The New Christian Advocate*, an official monthly for the clergy, became a biweekly. Its format was altered from pocket to newsweekly size, and its title was changed to *Christian Advocate*.

A motion picture to help solve the problem of interfaith marriage was released on September 1. The film was produced by the Family Life Department and the Methodist film production agency, TRAFCO.

It was announced in October 1959 that the membership of The Methodist Church in the United States had reached 9,798,508, including 27,750 ministers but not including 1,536,419 preparatory members. The number of congregations totaled 39,236.

The Council of Bishops elected Bishop Marvin A. Franklin of Jackson, Miss., as president. He is to be succeeded on April 21, 1960, by Bishop Gerald Kennedy of Los Angeles. Bishop Roy H. Short of Nashville, Tenn., is secretary.

RALPH STOODY,
General Secretary and Director, Commission on Public Relations and Methodist Information of The Methodist Church.

METROPOLITAN AND REGIONAL PLANNING. See CITY PLANNING; HOUSING.

MEXICO. As the third largest republic of Latin America, Mexico has an area of 760,335 square miles. A southern neighbor of the United States, Mexico is flanked by the Pacific Ocean (west and south) and the Gulf of Mexico (southeast); it borders Guatemala and British Honduras to the southeast.

Population.—With a growth rate since 1950 of almost 3% per year, Mexico's population (est. June 1959, 33,304,253) was expected to exceed 60 million by 1980. Although 55.7% of the population in 1956 consisted of rural dwellers, cities were growing more rapidly than rural areas. The nation's capital, Mexico City, located in the Federal District, had 4,924,500 persons in 1959; the next largest cities (with 1959 pop. est.) are Guadalajara (560,000), Monterrey (471,124), Puebla (325,940), and Mérida (231,881). Approximately 60% of the population is mestizo; 30% is Indian; and 10%, white. Spanish, the official language, is spoken by 88.8% of the population; 7.6% also speak one of the 50 Indian dialects, while 3.6% speak pure Indian languages.

Government.—The central government exercises extraordinary authority, although the 1917 constitution provides for a federal republic (which presently has 29 states, 2 national territories, and a Federal District). The president (Adolfo López Mateos), elected to a 6-year term beginning Dec. 1, 1958, wields wide legislative and executive powers; he cannot be re-elected. A bicameral legislature (including a Senate with 60 members and a Chamber of Deputies with 162) is composed almost entirely of members of the Partido Revolucionario Institucional (PRI), whose policies are formed by a party council. The president appoints the Supreme Court of 21 members for life tenure.

Education and Religion.—Jaime Torres Bodet, who became minister of education in December 1958, was confronted with a population of which an estimated one half to one third was illiterate. Mexico had fallen short of its constitutional guarantee of 6 years of free, compulsory education. The 1959 appropriation totaled 1,428.8 million pesos (12.49 pesos = U.S.$1), or 15% of the budget. About 40% of the 7.6 million school-age children could not attend schools because of lack of facilities. In 1959, 193,771 students attended 693 secondary and vocational schools and 30,011 attended 79 secondary and normal schools. In addition to the National University of Mexico and the National Polytechnic Institute, each with an average enrollment of 23,000 students, there are 16 state universities.

Finance.—The 1959 budget (as amended) of 9,643.8 million pesos reflected a 14.7% increase over the previous year, and 45% of this amount (4,213 million pesos) was allotted to economic development. Income taxes were expected to provide 30% of the 1959 revenues (5% less than in 1958); customs duties, 25%; and corporation taxes, 22%. A budget deficit of 71 million pesos was incurred in 1958, principally as the result of government salary increases. The public debt for September 1959 totaled 11.8 billion pesos, of which the foreign debt accounted for 5.225 billion pesos and the internal debt, 6.585 billion pesos.

Transportation and Communications.—Federal expenditures for highway construction and maintenance totaled 780 million pesos in 1959, while 118.5 million pesos were spent on railway construction and modernization. Mexico has invested 14.8 billion pesos on road construction since the beginning of the program in 1925, 46% of which was derived from gasoline taxes. In 1959 there were 17,140 miles of paved roads and 10,666 miles of surfaced roads. Two major and 20 secondary domestic air carriers service an airway system which extends from Mexico City to 50 important Mexican towns and to the United States. Since 1940 the number of Mexican air passengers has increased from 87,000 to over 2 million a year. There were 482,000 telephones in Mexico in 1959, half of which were located in the Federal District. Radio sets were estimated at 3 million in 1959, while broadcasting stations numbered 270; television sets totaled 450,000, serviced by 15 transmitters which were located in the principal cities.

General Economic Conditions.—Mexico's gross national product in 1958 rose to an estimated value of 67,470 million pesos (at 1950 prices), 4.6% above the previous year but considerably below the growth rate of 1954–56. The increase was attributed chiefly to the substantial expansion of agricultural production, while other sectors of the economy increased at a slower rate. Nominal gains were registered in railroad loadings and oil production, and new construction fell 37% during the first half of 1959 as compared with the same period in 1958. The cost of living index (1953 = 100) rose 15 points in 1958 to 150, but was stabilized at 154 by August 1959.

Agriculture and Food Production.—Agricultural production expanded 10% in 1958 (exceeding the former peak level reached in 1955 by 6%) and increased an additional 8% in 1959. Corn harvests were estimated at 5 million tons in 1958–59, and imports were suspended. Cotton production in 1959 was estimated at 2,345,000 bales of 500 pounds each, and an agreement with the United States was necessary to assure orderly marketing. Sugar production in 1959 totaled 1.27 million tons; coffee production amounted to 1.65 million bags; wheat tonnage of 1.3 million tons more than supplied the country's needs; and henequen production of 120,000 tons equaled the 1958 total. Beans, pineapples, bananas, and melons were other significant crops. The increased production in both 1958 and 1959 reflected the government's increasing attention to credit services at the expense of other forms of investment, such as the construction of new irrigation works.

Industry.—Industrial production, which had increased 5.8% in 1958, rose another 7.3% with the year ending September 1959. The chemical industry had become the fourth largest in Mexico; in 1958, the production of sulfuric acid increased 7%; caustic soda, 15%; and synthetic fibers, 14%. Pig iron production (1955 = 100) reached 152.7 in 1958, an increase of 17%, while crude steel production (1,112,434 tons in 1958, 6% above 1957) was expected to reach 1.5 million tons in 1960. While the cotton textile industry maintained its 1957 production figures, there were fairly substantial increases in the output of canned foods, tires, and refined sugar in 1958. Cement production increased by 10.9% in 1958, reaching 3.36 million tons. Three expansion projects increased cement production by a further 465,000 tons as of June 1959.

Mining.—Production of minerals in 1958 contributed 3% of the national product and 14% of the total value of exports. Despite the fall in prices and contraction in external demand, the 1958 mining output approximated that of 1957. Production of major minerals in 1958 (with 1957 figures in parentheses), in metric tons, was as follows: copper, 64,964 (60,600); lead, 194,110 (213,600); zinc, 224,102 (243,600); silver, 1,484 (1,340); and gold, 10.8 (10.8).

Petroleros Mexicanos (Pemex) produces and

markets all Mexican petroleum. Nearly 90% of the nation's energy is provided by this source, as hydroelectric power is limited and coal is scarce. By September 1959, monthly production of crude oil was averaging 1,191,370 metric tons, 9.2% above 1958. There were 379 wells drilled and 4 new fields opened in 1958. The completion of an absorption plant in the Tabasco oilfields, and the construction of gas pipelines from production to consumer centers curtailed the need for petroleum imports, which dropped from $91 million in 1957 to $47 million for the first nine months of 1958.

Foreign Trade.—Maintaining its 1957 level, exports totaled $708 million and imports $1,128 million in 1958. The unfavorable trade balance was offset in part by net tourist receipts of $318 million (12% below 1957). Mexican rural workers in the United States helped restore the trade balance by sending $31.6 million to their families in 1958. Partial restoration of a balanced trade was evidenced during the first half of 1959 with a 12% increase in exports ($407), 20% decrease in imports ($486), and 12% increase in tourist receipts ($233.4). Gold and foreign exchange reserves, which fell to $368 million in December 1958 (19% below December 1957), rose again to $411.4 million in September 1959.

Leading exports by value in 1958 were cotton (26%), coffee (11%), minerals (14.5%), and cattle and meat (7%). Imports were led by machinery (24.1%) and industrial raw materials (15.9%). The United States continued to predominate in Mexican trade during 1958, absorbing almost 62% of Mexican exports and providing 77% of the imports.

Principal Events, 1959.—President López Mateos worked to win the hearts and minds of his people in his first year of office. The maldistribution of wealth belied the revolutionary expectations of the masses; the cost of living had risen by 40% and wages by 20% in three years. Natural disasters compounded the problem. An earthquake killed at least 16 people, injured 60, and caused extensive property damage in the state of Vera Cruz on August 26. The Santiago River overflowed its banks in August in its worst flood since 1943. And the port of Manzanillo on the Pacific coast was struck by a hurricane on October 27 which developed into a catastrophe, as at least 1,452 lives were lost from flooding and mud slides which followed the storm in the states of Colima and Jalisco.

As with his predecessors, López Mateos selected a particular part of the country—Yucatan—for special development during his administration. The laboring class of Mexico City was favored by a program on July 8 which marketed frozen fish for 12 cents a pound, as compared with the fixed monopoly price of 70 cents. The Department of Agrarian Affairs and Colonization was preparing in August to relocate 6,000 families of miners on 25 to 50 acre plots in Chiapas and Tabasco. Land-hungry peasants in Sonora, who were evicted by federal troops in January, were promised land elsewhere.

To forestall further inflation the government denied increased wage benefits to striking labor unions. A government ultimatum halted the strike of 500 airline pilots, January 23–28, when a 29% pay increase above their average monthly salary of $1,360 was demanded. A union strike against the government railroads on February 25–26 collapsed, but most of the companies agreed to 16⅔% wage increases. When similar increases were demanded by 14,000 striking workers of other railways on March 25, supported by one-hour sympathy strikes of 60,000 additional workers, the secretary general of the Railway Workers Union, Demetrio Vallejo, and a reported 500 unionists were arrested on March 28 and held incommunicado in a military prison.

Communists were implicated in the railway strike. A second secretary and military attaché of the Soviet embassy in Mexico City were charged with conspiracy in the case and ordered on March 31 to leave the country. The police and secret service raided the Communist Party headquarters on April 5, and Dionisio Encina Rodriguez, secretary general of the party for 19 years, was arrested on September 2 for subversive acts which involved him in the strike.

Increasing pressure from local and state members of the PRI prompted the Central Executive Committee to permit primary elections in which gubernatorial nominees could gain party endorsement from rank and file membership. In San Luis Potosi, a statewide strike in December 1958 against the governor (a puppet of Col. Gonzalo N. Santos, who for 18 years had held absolute power in the state), resulted in the demise of the Santos political machine. Dissatisfaction with state party officials who had been arbitrarily selected by the central committee was also evidenced in the large protest vote in Lower California in August.

The new administration did not succumb to increasing nationalistic sentiments. Spontaneous press demands during the summer supported the return of United States sulfur interests to Mexican ownership; the subsecretary of the Ministry of National Patrimony proposed that 88% of the foreign-owned mines be Mexicanized; the Mexican National Chamber of Commerce resolved on September 12 to study the possibility of tightening laws governing foreign investment.

The PRI seized advantage of the president's decision (January 23) to break diplomatic relations with Guatemala by staging a 450,000-person demonstration in front of the Presidential Palace on February 1. Two Guatemalan planes had strafed Mexican shrimp boats in the Pacific on Dec. 31, 1958, killing 3 crew members and wounding 14, and the Guatemalan president had rejected Mexico's proposal for arbitration. Diplomatic relations finally were resumed on September 15.

Mexican relations with the United States were maintained on a cordial level. The late Secretary of State John Foster Dulles headed the United States delegation to the president's inauguration on Dec. 1, 1958. President Eisenhower met informally with López Mateos in Acapulco on February 19–20, and the president's brother, Milton Eisenhower, arrived in Mexico on August 12 for two weeks of general discussions. During López Mateos' return visit to the United States on October 9–15 and 18 (he visited Canada during the interval), economic policies relating to the marketing of zinc, lead, and cotton were discussed.

Anastas I. Mikoyan, first deputy premier of the Soviet Union, arrived in Mexico City for a 10-day visit on November 18. He opened the Soviet Trade Exhibition in the capital on November 21, and also conferred with López Mateos. The presence of the Soviet official at the large trade show (which closed on December 15) was regarded as pointing up Moscow's effort to increase commercial dealings with Mexico.

MARTIN B. TRAVIS,
Associate Professor of Political Science,
Stanford University.

MEYER, Eugene (83), American financier, government official, and newspaper publisher: b. Los

Angeles, Calif., Oct. 31, 1875; d. Washington, D.C., July 17, 1959. Eugene Meyer achieved remarkable success in three different fields. He made a fortune as a banker and broker by the age of 41; he served in important government posts under seven presidents from Woodrow Wilson to Dwight D. Eisenhower; and he was editor, publisher, and chairman of the board of one of the country's most influential daily newspapers.

Young Meyer, after attending the University of California and Yale University (B.A., 1895) and two years of banking and language study in Europe, joined the New York City firm of Lazard Frères, in which his father was a partner. In 1901 he set out on his own, opening Eugene Meyer, Jr., and Co., specializing in railroad, copper, oil, and automobile securities. By 1917, this venture had earned him a fortune and a reputation.

In that year he was appointed adviser on nonferrous metals to the federal government and was named to the Council of National Defense. He subsequently dissolved his business to give full time to such federal posts as managing director of the War Finance Corporation under Presidents Wilson, Harding, and Coolidge; member of the Federal Farm Loan Board (1927–29); first governor of the Federal Reserve Board (September 1930–May 1933); first chairman of the Reconstruction Finance Corporation (February–July 1932); and first president of the International Bank for Reconstruction and Development (June–December 1946).

In June 1933 Meyer opened the third phase of his career by buying the bankrupt Washington *Post*. He was that newspaper's publisher from 1933 to 1940, editor and publisher from 1940 to 1946, and, after 1947, chairman of its board. The newspaper's circulation had quadrupled by 1954, when Meyer bought Col. Robert R. McCormick's Washington *Times-Herald* and merged it with the *Post*. The combined *Post and Times-Herald* circulation in 1959 was well over 390,000, making it the largest daily newspaper in the nation's capital. In 1955 Mr. and Mrs. Meyer turned over to staff members half a million dollars' worth of the newspaper's stock.

MICA. World production of mica in 1958, for the fourth successive year, remained at the high level of about 320 million pounds, according to the U.S. Bureau of Mines. India leads in output of block and splittings, and the United States in scrap output. Domestic mica sold or used in 1958 increased about 1% in quantity and 6% in value, compared with 1957. In 1958, United States output of sheet mica was 660,000 pounds, compared with 690,000 pounds in 1957; output of scrap mica was 186,694,000 pounds, compared with 184,876,000 in 1957. The quantity of mica imports for consumption declined in 1958 about 14%, and total exports of mica and mica products declined 11%. Nevertheless, exports of unmanufactured mica exceeded 1 million pounds for the first time. General imports increased 7% over 1957. Brazil, for the third successive year, supplied the largest quantity of better block mica. (See also MINERAL PRODUCTION for table showing output of major producing countries.)

MICHIGAN. North Central state, United States; admitted to the Union, Jan. 26, 1837. The "Wolverine State" ranks 23d in area and 7th in population among the 50 states.

Area and Population.—Area: 58,216 square miles (land, 57,022; inland water, 1,194), divided into 83 counties. Population: (1950) 6,371,766; (est., July 1, 1958) 7,830,000. Urban places with populations above 15,000 (as estimated by the State Department of Health for July 1, 1957) are:

Adrian	23,950	Kalamazoo	75,020
Allen Park	40,010	Lansing (*capital*)	111,850
Alpena	15,260	Lincoln Park	54,080
Ann Arbor	54,460	Livonia	48,910
Battle Creek	54,800	Marquette	18,700
Bay City	60,380	Midland	27,920
Benton Harbor	25,460	Monroe	28,020
Berkley	22,950	Mount Clemens	25,550
Birmingham	26,200	Muskegon	57,400
Dearborn	129,700	Muskegon Heights	23,050
Detroit	1,875,000*	Niles	18,160

* 1959 estimate.

Executive.—Chief state officers in 1959:
Governor: G. Mennen Williams (Democrat)
Lieutenant Governor: John B. Swainson
Secretary of State: James M. Hare
Treasurer: Sanford A. Brown
Attorney General: Paul L. Adams
Auditor General: Frank S. Szymanski
Supt. of Public Instruction: Lynn M. Bartlett

Constitution and Judiciary.—The present constitution went into effect in 1909. The Supreme Court comprises eight justices; chief justice in 1959 was John R. Dethmers.

Legislature.—The Michigan Legislature comprises a 34-member Senate (in 1959, 22 Republicans and 12 Democrats) and a 110-member House of Representatives (55 Republicans and 55 Democrats), which meet annually commencing the second Wednesday in January.

The 1959 legislature was primarily concerned with solving the state's financial crisis (see below, *Principal Events, 1959*) in a year-long session which began on January 14.

Nonfiscal legislation included measures that amended the election laws; effected minor changes in governmental organization; granted university status to Central Michigan College; permitted school districts operating programs from kindergarten through grade 12 within a county or contiguous counties to create community colleges; and permitted the use of General Fund monies for school aid.

Three amendments approved by the voters on April 6 provided for succession in state government in emergencies; authorized establishment of a board of governors for Wayne State University; and changed the name of the governing body of Michigan State University to Trustees of Michigan State University.

Finance.—In the 1958–59 fiscal year, state revenue of $1,017,281,104 comprised $782,055,598 from state tax sources, $133,075,120 from the federal government, and $102,150,386 from other sources. Tax revenue consisted of $300,761,184 from a 3% general sales tax, $52,559,745 from corporate income taxes, $138,611,543 from motor fuel taxes, and $290,123,126 from other sources. Expenditures of $1,090,948,294 comprised $405,796,595 for education, $292,192,785 for health, welfare, safety, defense, and adult correction, $240,925,317 for highways, and $152,033,597 for other purposes. State long-term indebtedness on June 30, 1959, amounted to $177,607,000.

Banking.—As of June 10, 1959, the state's 75 national banks had $4,363,644,000 in assets, $2,353,999,000 in demand deposits, and $1,505,587,000 in time deposits. The 313 state banks had assets of $4,635,629,486, demand deposits of $1,518,063,804, and time deposits of $2,217,980,694.

Education.—School attendance is compulsory between the ages of 6 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $502,084,289 ($330.72 per pupil), of which $238,693,072 was derived from local school districts. Outlays for construction and improvements

MICHIGAN SCHOOL STATISTICS, 1958–59

Type of school	No.	Teachers	Students
Public elementary (k–6)	...*	35,258	1,017,776
Public junior & senior high	2,308	22,996	556,830
Private and parochial elementary and secondary	...	1,740	281,967
Junior colleges	16	682	22,945
Colleges and universities	32	6,024	109,717
Other higher institutions	13	474	11,002

* Included in junior and senior high total.

amounted to $176,777,949, and teachers' salaries averaged $5,340.

Public Assistance.—In the 1958–59 fiscal year, public assistance expenditures from federal and state funds (excluding institutional costs) totaled $148,692,316.39, including $50,697,166 for the aged, $40,745,669 for dependent children, and $52,004,855.39 for general relief. A monthly average of 321,816 persons received assistance.

Labor Force.—The state's labor force totaled 2,901,900 in September 1959, including 161,000 agricultural workers. Nonagricultural employment was 2,510,900, compared with 2,417,400 a year earlier and an average of 2,420,000 in 1958. Of nonfarm employees in 1959, 39% were employed in manufacturing, 16.7% in trade, and 12.5% in government. Unemployment was down to 205,000 in September 1959 from 422,000 in the previous September, but it had been as high as 340,000 in March 1959, and the Employment Security Commission, which anticipated a hard core of unemployment for an indefinite period, predicted an average of 275,000 unemployed for 1959. The state's Upper Peninsula felt the severest decline in job opportunities and asked both private and government aid in solving its economic problems. Because of heavy unemployment, the state paid $326,428,009 in unemployment compensation in 1958, seriously depleting the Unemployment Compensation Fund.

Manufacturing.—The 1,071,246 persons employed in manufacturing in 1957 received $5,838,997,000 in wages. Value added by manufacture totaled $10,375,378,000, and outlays for new plant and equipment amounted to $694,705,000. Production workers averaged $108.15 for an average workweek of 40.4 hours in August 1959.

MAJOR MICHIGAN MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.* (thousands of dollars)
Transportation equipment	368,432	$2,001,388	$4,079,554
Nonelectrical machinery	165,217	983,506	1,588,819
Fabricated metal products	102,296	531,960	878,318
Primary metal industries	81,777	472,586	809,500
Food and kindred products	58,951	281,618	642,633
Chemicals and products	40,614	235,851	621,250
Pulp, paper, and products	32,044	167,224	300,358
Printing and publishing	30,735	164,455	276,947
Electrical machinery	23,103	114,683	211,557
Stone, clay, glass products	17,072	87,567	188,148

*For definition see footnote 1 in the article *Industrial Production.* (Source: *Annual Survey of Manufactures: 1957.*)

Mining.—In 1958 Michigan was 15th among the states in the value of its mineral output, with 2.08% of the national total. The state ranked first in output of bromine, peat, and salt (19% of the national total); second in gypsum, crude iron ore, and sand and gravel; fourth in cement; and fifth in copper (6% of domestic output).

MICHIGAN MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Cement (bbl.)	20,912,000	$ 70,432,000
Clays	1,663,000	1,813,000
Coke	2,526,202	43,527,893[1]
Copper	58,005	30,511,000
Gypsum	1,331,000	4,824,000
Iron ore, usable (long tons)	8,111,000	69,845,000
Natural gas (1,000 cu. ft.)[2]	14,243,000	2,649,000
Peat	107,342	1,684,000
Petroleum (bbl.)[2]	9,307,000	27,363,000
Salt, common	4,267,000	33,018,000
Sand and gravel	39,871,000	34,616,000
Stone	27,188,000	26,846,000
Other minerals	...	45,558,000
Total	...	$343,483,000[3]

[1] Value for processed materials is not included in total. [2] Preliminary. [3] Total adjusted to eliminate duplication of value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income in the first nine months of 1959 was down slightly to $525,920,000 from $531,722,000 for the corresponding period of 1958. For the full year 1958, income comprised $407,918,000 from livestock and livestock products, $306,200,000 from crops and $25,592,000 from government payments. Principal income sources in 1958 were dairy products, $192,745,000; cattle, $96,365,000, and wheat, $62,446,000.

MICHIGAN CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	8,616	12,200	12,000
Beans, dry edible (1,000 bags)	4,105	5,226	5,974
Cherries (tons)	80,060	63,000	99,500
Corn (1,000 bu.)	81,781	106,344	125,571
Grapes (tons)	37,650	50,500	57,000
Hay (1,000 tons)	3,528	3,176	3,801
Maple sirup (1,000 gal.)	85	86	51
Oats (1,000 bu.)	47,625	53,856	38,540
Peaches (1,000 bu.)	2,912	3,200	3,100
Potatoes (1,000 cwt.)	7,435*	8,745	7,722
Soybeans (1,000 bu.)	2,668	6,095	5,400
Strawberries (1,000 lb.)	32,585*	41,040	30,600
Sugar beets (1,000 short tons)	718	1,112	1,294
Wheat (1,000 bu.)	32,935	41,800	35,123

* Average, 1949–57. (Source: U.S. Department of Agriculture.)

The state had 136,000 farms in 1958. Total acreage (1954) was 16,467,000, including 7,659,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 1,829,000 cattle, 719,000 hogs, and 9,683,000 chickens (excluding commercial broilers). Family and hired workers engaged in farming numbered 196,000 during the week of Nov. 22–29, 1959.

Transportation and Communications.—State and federal funds distributed for highways in the 1958–59 fiscal year totaled $203,766,664.40, including $28,148,755.09 for maintenance.

Highways and roads on Jan. 1, 1959, totaled 109,714 miles (88,492 miles surfaced). Registered *motor vehicles* in 1958 totaled 3,495,171, including 2,704,202 passenger cars. There were (1959) 32 *railroads* operating 5,672 line miles; 13 regularly scheduled *airlines;* and 224 *airports and airfields* (89 commercial and municipal, 6 military, 56 private, and 73 other).

Communications media included (1958) 73 AM and 29 FM *radio stations;* (1959) 13 VHF and 2 UHF *television stations;* 56 daily *newspapers* (circulation, 2,390,613) and 302 other newspapers; and (January 1) 778,800 business and 2,282,000 residential *telephones.*

Principal Events, 1959.—Gov. G. Mennen Williams' 11th year in office opened on a distressing state financial situation. The depression in automobile manufacturing during the first three quarters of 1958 had decreased state revenues and increased welfare costs. State spending had nearly doubled in the past decade. During the fiscal year ending June 30, 1959, expenditures from the Gen-

Steel shortage due to the 1959 strike forced some automobile companies to halt production. Here, Cadillac's Detroit assembly plant stands idle after shutdown on October 30.

WIDE WORLD

cral Fund exceeded income by $29 million. The state constitution earmarks the distribution of nearly two thirds of the income, limits the sales tax to 3%, and prohibits borrowing in excess of $250,000. The only sources of ready cash to meet state obligations were Veterans Trust Fund securities worth more than $45 million.

The governor and fellow-Democrats proposed a graduated personal income tax together with levies on profits of corporations and financial institutions, intended to yield over $100 million annually. The Republicans preferred a 1% increase in the sales tax to bring in approximately the same amount. In the House of Representatives, evenly split between the two parties, neither side could get the majority needed for a tax bill, and in the Senate the Republican majority killed attempts at compromise. By March the state was $15 million in arrears to the state universities, which had borrowed on their own credit, and more than $35 million behind in support to public schools. The governor appealed to large corporations to pay taxes in advance and received some $35 million from this source to support the state until the middle of April. In May, paychecks of some 26,000 state employees were held up for several days because of a lack of funds, and other payments were much in arrears.

Through the summer, the possibility of any income tax legislation faded and was abandoned. In September the governor signed a bill authorizing a 1% use tax, separate in theory from the existing sales tax, to provide for a record budget adopted by the legislature. This tax was immediately challenged in a suit in the Michigan Supreme Court and, on October 22, by a split decision along party lines, was declared unconstitutional. State finances reverted to their previous chaotic condition. Finally, on December 18, the legislature passed a temporary tax bill, to be effective only until June 30, 1961, designed to produce $37 million through increased taxes on tobacco and liquor, new levies on telephone and telegraph services, and the addition of 1 mill to the 4-mill corporation franchise fee. The lawmakers also authorized liquidation of the Veterans Trust Fund securities.

Counterbalanced against governmental fiscal difficulties was the state's improved economic situation. Since September 1958 the automobile industry had been recovering from its slump. In 1959, monthly production reached new peaks, with profits in April the highest since 1957 levels. Later in the year, high manufacturing profits were yielded from production of the new "small cars." (See also AUTOMOBILES.) Although automobile production was high, the percentage of Michigan unemployment was twice the national average, a condition resulting from increased efficiency within the industries and the shift of defense spending away from the state. Another major economic development in the state was the opening of the St. Lawrence Seaway (q.v.), which brought large numbers of foreign freighters to the Great Lakes and crowded the Port of Detroit.

There were few and unimportant labor disputes until July, when the national steel strike (see IRON AND STEEL) idled some 17,000 workers in Michigan plants. Large steel stocks kept the automobile industry busy until early November, when production slowed and finally stopped in many assemblies. The Taft-Hartley injunction, returning workers to the steel mills, again started materials flowing, and full production of automobiles was resumed before the end of the year.

MIDDLE CONGO. See CONGO.

MIDDLE EAST. Tensions in the Middle East slackened appreciably during 1959. Because of its oil the area remained of supreme importance to the West, and there were still many tensions and dangers to be observed there, particularly in Iraq. Nevertheless, governments such as Jordan and Lebanon, which seemed in 1958 to have their very existence threatened, had not, in fact, collapsed but seemed possibly stronger than ever. Communism had not, despite some ill-timed efforts, made appreciable progress in the area, and Western countries seemed to be having more success in coming to terms with Arab and other nationalisms.

One of the most obvious developments in 1959 was the decline in the prestige of President Gamal Abdel Nasser of Egypt, who had hitherto been fortune's darling. Even though his position was not seriously undermined, his astonishing luck seemed to have run out in 1959, and his remoter hopes seemed unlikely to be realized.

Before 1959, Nasser had enjoyed great popularity with the masses in other Arab countries, and with this mass support it seemed possible that he would be able to overturn other governments and weld the Arab peoples into a united whole under his leadership. This process he had already begun in 1958 by linking Syria with Egypt in the United Arab Republic (UAR) and joining Yemen with the UAR to form the United Arab States. The apogee of his success was reached in July 1958 when the rival short-lived Arab Union of Iraq and Jordan was destroyed by the coup d'état of Iraqi army officers in Baghdad. There seemed at first a likelihood that Iraq, too, would quickly join the United Arab Republic, but in this hope Nasser was disappointed when the nationalist and pro-Nasser uprising at Mosul, Iraq, on March 7–10, 1959, was easily defeated and most of the UAR's embassy officials were expelled from Baghdad on March 10. Confronted for the first time by a serious rival to his authority inside the Arab world in the person of Iraqi Brig. Gen. Abdul Karim al-Kassem, Nasser had reacted maladroitly by openly and unsuccessfully advocating treason against the established government of a fellow Arab state.

Nasser's hopes of taking over Jordan were equally frustrated. King Hussein I sailed through many storms in 1957 and 1958 into calmer waters, and Jordan had become by 1959 an oasis of peace amid the tumults and uncertainties of the Arab world. Nasser tacitly acknowledged that his previous pressure on Jordan was achieving nothing when it was announced on Aug. 16, 1959, that the UAR had resumed diplomatic relations (suspended since July 1958) with King Hussein's government. A further symbol of Jordan's new-found stability was the state visit to Amman paid by the shah of Iran on Nov. 2–7, 1959.

Nasser's problems were by no means confined to the field of foreign policy. His revolution had yet to bring any tangible benefits to the Egyptian masses. In the Syrian Region discontent was more overt and was naturally stimulated by resentment at a union which virtually meant Egyptian rule. The dictator of Egypt responded by appointing (Oct. 21, 1959) his right-hand man, Field Marshal Abdel Hakim Amer, UAR vice president and chief of the armed forces, as supervisor of general policy for Syria, with a very wide range of powers. The appointment was readily understandable from an administrative point of view, for Syria had proved an awkward partner during the first year of the union, but whether it would be popular in Syria was another matter. It speedily became obvious

UPI

Vice President Richard M. Nixon (at lectern) addresses the opening session of the Ministerial Council of the Central Treaty Organization (CENTO), meeting in Washington on October 7. Seated on the platform (left to right) are: (first row) Manuchehr Eqbal, prime minister of Iran, with his interpreter; Jamshid Amuzegar, Iranian minister of labor; Manzoor Qadir, foreign minister of Pakistan; M.O.A. Baig, secretary general of CENTO; Adnan Menderes, prime minister of Turkey; Sir Harold A. Caccia, British ambassador to the United States; and U.S. Secretary of State Christian A. Herter; (at rear right, behind Herter) Fatin Rüştü Zorlu, foreign minister of Turkey, and Sir Bernard A. Burrows, British ambassador to Turkey.

that the appointment was extremely unpopular in Iraq, where it was given a sinister interpretation as a preparatory step for an attack.

Syria also proved the occasion of another headache for Nasser. When the Chinese Communist government celebrated its 10th anniversary at Peking on Oct. 1, 1959, a representative of the UAR was there by invitation; but so was Khalid Baqdash, leader of the proscribed Syrian Communist Party, who, on September 28, was permitted by his Chinese hosts to make a bitter public attack on the Nasser regime in Syria. The UAR representative withdrew in protest, and Nasser's policy took a more pronounced anti-Communist slant. Russian policy, however, which is forced to deal with Middle Eastern realities more intimately than is distant China, has continued to be perfectly correct toward the UAR.

As Nasser has found himself more at odds with the Communist world, he has moved to a correspondingly more friendly relationship with the West, and the West has edged cautiously toward a rapprochement with him. A financial agreement between the UAR and Britain was initialed on Feb. 28, 1959. Diplomatic relations with Australia, ruptured at the time of the Suez crisis in 1956, were resumed in October 1959, and those with Britain on December 1.

In the Middle East in 1959 it was not only Nasser's prestige that diminished. The same decline infected the prestige of the Arab League (q.v.), which had enjoyed a sudden upsurge in importance in the years 1956–58 when the whole Arab world had appeared to be advancing rapidly toward unity. However, the atmosphere of 1959 was rather one of general disarray, the old slogans serving to cloak impotence and mutual distrust.

A meeting of the Arab League held at Casablanca for the first time in early September indicated the increased attention that the Arabs are paying, especially during the continuing Algerian crisis, to the Maghrib—the western part of the Arab world embracing Morocco, Algeria, Tunisia, and Libya—and symbolized the popular Arab slogan of "one nation from the Atlantic to the (Persian) Gulf." The unity, however, was somewhat illusory. Iraq was not represented, and neither was Tunisia, which, having no common frontier with Egypt, is able to take a firmly independent line. Tunisian Premier Bourguiba has declared his determination to have no truck with Egypt until the UAR has publicly retracted the attacks made on Tunisia at the Arab League meeting in October 1958—an apology not yet forthcoming.

Therefore, the representation at the Casablanca meeting of the Arab world, and even of the Maghrib, was noticeably defective. The only subjects at the meeting on which there was any general agreement were an endorsement of Nasser's policy in closing the Suez Canal to Israeli shipping, and a resolution in favor of raising an Arab "Army of Palestine" of 250,000 men and of establishing a separate Palestine Arab government. These proposals, which looked to the expiration in 1960 of the United Nations mandate to care for Palestine refugees, were flamboyant and unlikely to be carried out, the more so since they were opposed by Jordan, obviously the country most closely concerned.

In 1959, as earlier, the two poles of the Arab world continued to be Cairo and Baghdad, and it continued to be possible to write the history of the Middle East almost exclusively in terms of the rivalry between Egypt and Iraq, for that rivalry had merely taken a new form. Precisely what the long-term significance of General Kassem's rule in Iraq would turn out to be was still quite uncertain. By the end of 1959 the situation in Iraq was as obscure as ever, and the mystery hung like a dark cloud over the Middle East. Three forces contended for control of Iraq: the pro-Nasser Arab nationalists, the Iraqi Communists, and the Iraqi nationalists. The last-named and the pro-Nasser element had a tendency to work together, at least in opposition to the Communists; but the truth was that the country was so bitterly divided that whoever tried to rule it was bound to find large-scale and determined opposition from one quarter or another.

The personality and policy of General Kassem could not be discerned with certainty through the shifting fog of events in Iraq. The fury with which he punished the Mosul uprising in March played into the hands of the Communists, who appeared

to gain more and more influence as spring wore on toward summer. But after the Communist-led revolt at Kirkuk on July 14–18, he appeared to turn against them and sharply curtailed their powers. Throughout the year there was a steady decline in Kassem's popularity as administration of the country became less efficient, business lay in the doldrums of general uncertainty, and the brave promises with which the regime came to power became more and more a mocking memory. Finally, after the attempt on Kassem's life on October 7 by unknown assassins, it was by no means certain who actually ruled in Iraq. In the last days of the year, Kassem seemed to be bent on distracting attention from his incompetence at home by picking a border quarrel with Iran.

The one thing that was quite clear was that Iraq was no longer, as it had been before July 1958, an element of strength for the West in the Middle East. Yet even that point was not free of ambiguities until well into 1959. Iraq did not at first withdraw from membership in the Baghdad Pact, though it was obvious to the other members (Britain, Iran, Pakistan, and Turkey) that she had effectively ceased to be a member; and this was recognized at the sixth session of its Council of Ministers, held in Karachi on January 26–28, which Iraq did not attend.

The Baghdad Pact was essentially replaced by bilateral defense agreements signed at Ankara on March 5, 1959, between the United States and Turkey, Iran, and Pakistan. A point of significance about these new arrangements is that the "northern tier" of Middle East countries are not Arab, for Iraq's formal withdrawal from the Baghdad Pact on March 24 meant the loss of the pact's only Arab member. Despite the fact that the United States has never been a member of the Baghdad Pact, the next meeting of the Council of Ministers of the organization, which by this time had changed its name to the Central Treaty Organization (CENTO), was held in Washington on October 7–9. The United States continued to resist all blandishments to become a member, and the new bilateral treaties rendered its membership less necessary than it had ever been.

One trouble spot within the general Middle East area whose problems seemed to be approaching solution in 1959 was Cyprus. On February 19, agreements were initialed in London which envisaged the establishment by Feb. 19, 1960, of the Republic of Cyprus. The agreements resulted from rather surprising concessions: the Cypriote Greeks gave up the ideal of *enosis* (union with Greece); the British gave up control of the island, apart from some military bases; and the Turkish Cypriotes agreed to live in a state in which they would be a minority. Many details of the proposed constitution remained to be worked out, and several times during the year the negotiations approached stalemate.

The trend of events in the extreme south of Arabia was also satisfactory to the West. There, in the British-controlled Western Aden Protectorate, 6 of the 18 principalities of the area joined on Feb. 11, 1959, to form the Federation of the Arab Amirates of the South (see ADEN). The new grouping was formed with British encouragement as a counterweight to the neighboring state of Yemen, a member of the United Arab States.

Although by the end of the year, crude projects of nationalization were in abeyance for the moment, Arab opinion throughout the Middle East continued to be exercised by the problem of giving the Arab world a greater control over the exploitation of its one great resource, oil, and a greater share of the profits therefrom. This was the theme of a conference convened by the Oil Affairs Department of the Arab League at Jiddah, Saudi Arabia, on Oct. 25–27, 1959. Oil experts from all members of the league except Tunisia attended. Approval was given to the proposal for a 1,250-mile pipeline linking the oilfields of Iraq, Kuwait, and Saudi Arabia with ports in Syria and Lebanon.

MINERAL PRODUCTION. The following table shows the trend of production of the more important mineral commodities in the major producing countries during recent years. (See also separate articles on the more important minerals.) Totals include outputs of minor countries not listed. In some cases production data are too incomplete to justify showing a total. Listing usually includes countries that have produced more than 1% of the total at any time since 1939. (These tables are based largely on data supplied by the Foreign Activities Staff of the U.S. Bureau of Mines, with gaps filled from other sources.)

Figures in parentheses are for the preceding year, as a substitute for those lacking for the year indicated. A figure with fewer decimal places indicated than others in the same table is an estimate. A question (?) means unknown or an estimate; a dash (—) means no production reported.

WORLD PRODUCTION OF MAJOR MINERALS

	1939	1956	1957	1958
Aluminum		(Thousands of metric tons)		
Austria	—	59.4	56.4	56.9
Canada	75.0	562.7	505.1	586.0

[1] Federal Republic only, in postwar years. [2] Smelter output. [3] Crude. [4] Less than 50 tons. [5] Exports. [6] Marketable in equivalent K_2O. [7] Concentrates, 60 per cent WO_3. [8] Includes secondary. [9] Total platinum group metals. [10] Exports of crude platinum. [11] Other platinum metals. [12] Included under Germany. [13] Includes Pb content of lead bullion. [14] Republic of Korea only, in postwar years. [15] Excludes estimate for USSR. [16] Cadmium content of flue dust exported for treatment elsewhere; to avoid duplication, data are not included in total. [17] U.S. imports. [18] Oven and beehive coke, excluding breeze. [19] Southern Zone (formerly French Morocco) only. [20] Includes estimate for USSR. [21] Including Ruanda-Urundi.

BERENICE B. MITCHELL,
Commodity Industry Analyst, Division of Foreign Activities, U.S. Bureau of Mines.

MINERALOGY. International Mineralogical Association.—The association held its first congress in Zurich, Switzerland, on Aug. 28–Sept. 4, 1959, attended by more than 200 mineralogists from all parts of the world. At Technical University, which acted as host for the conference, two symposia were conducted, one on twinning in crystals and the other on Alpine fissure minerals. Two five-day field trips, in the eastern and western Alps, were conducted following the meeting.

The International Mineralogical Association came into being in Madrid, Spain, in April 1958, when delegates representing 14 countries were present. By the time of the Zurich meeting, seven additional mineralogical societies had joined the association, and official delegates from 19 of these 21 members attended the 1959 conference. Arrangements are being made in several other countries to join the association, and in some cases national mineralogical societies are being organized for this purpose.

Mineralogical Society of America.—The annual meeting of the Mineralogical Society of America, held in Pittsburgh, Pa., on Nov. 2–4, 1959, was attended by more than 400 fellows and members. There were 10 scientific sessions at which 107 papers of mineralogical interest were presented. The meeting was the occasion of the presentation of the Roebling Medal, the society's highest honor, to Professor Felix Machatschki of the University of Vienna, for his many contributions to the science of mineralogy, particularly for his early work on the structure of the silicate minerals. The Mineralogical Society of America Award, an honor conferred annually by the society for a major contribution to mineralogy made by an individual under 35 years of age, went in 1959 to Dr. Harry F. W. Taylor of Aberdeen, Scotland, for his work on the calcium silicate minerals.

The Mineralogical Society of America has grown continuously since its formation in 1920. The year 1959, however, saw a greater growth than in any previous year of the society's history, and on November 1 there were 1,877 members, an increase of more than 300 over the previous year. In addition there were 1,339 subscribers to the *American Mineralogist,* the journal published by the society.

Mineralogical Abstracts.—Since 1920 the British Mineralogical Society has published with its *Mineralogical Magazine* a separately paged appendix of "Mineralogical Abstracts." These were discontinued in December 1958, but in their place there is a new enlarged journal, *Mineralogical Abstracts,* published under the joint auspices of the British and American Mineralogical societies. This new journal, issued quarterly, will provide a greater world coverage of mineralogical literature.

Mineralogy Textbooks.—Not for many years has a new United States textbook of mineralogy been published. In 1959, however, there appeared two new college textbooks and complete revisions of two old ones. The new books are *Mineralogy: Concepts, Descriptions, Determinations* (San Francisco), by L. G. Berry and Brian Mason; and *Principles of Mineralogy* (New York), by W. H. Dennen. The revised books are *Mineralogy* (New York), 5th edition, by E. H. Kraus, W. F. Hunt, and L. S. Ramsdell; and Dana's *Manual of Mineralogy* (New York), 17th edition, by C. S. Hurlbut, Jr. The book *Getting Acquainted with Minerals* (New York), by G. L. English, written for the amateur mineralogist, appeared in 1958 completely revised by D. E. Jensen.

C. S. HURLBUT, JR.
Professor of Mineralogy, Harvard University.

MINING. U.S. Bureau of Mines.—Reduced demand for certain minerals and increased production capacity for others combined to create surpluses of several commodities in 1959, causing the Bureau of Mines to relax its search for assured mineral supplies and to shift attention to investigating and developing the potential of less-well-known elements and alloys. At the same time, the bureau emphasized studies designed to improve United States technology and to help the nation's industries meet increasing competition from other countries now recovered from the impact of World War II.

Preliminary estimates by the bureau placed the value of all United States mineral production in 1959 at $17.1 billion, compared with $16.5 billion in 1958. These values include petroleum, coal, and other fuels, as well as metals and nonmetals.

Important advances were made in most phases of bureau activity during the year. Mining and metallurgical studies yielded new or improved extraction and processing methods; research in coal, petroleum, and natural gas developed more precise investigative tools; and the bureau's helium-production capacity was increased substantially with completion of a new government plant to extract this valuable lightweight element from natural gas. The bureau also stepped up its production of safety education films for mineral industry workers, while its scientific studies in this field developed new protective devices for coal miners.

Mining and Metallurgy.—Furthering long-range fundamental studies of blasting effects in mining, the bureau employed high-speed photography to obtain new information on the use of explosives in stone quarries. Similar investigations yielded physical data on rock breakage by explosives.

During the year, two accomplishments by bureau metallurgists awakened widespread scientific interest. The attainments, both of which promise to speed the nation's space exploration and missiles programs, were laboratory production of the world's first shaped molybdenum casting and development of techniques for making high-purity tungsten.

Other metallurgical features of the year were basic studies that uncovered new facts about such rare-earth metals as erbium, holmium, dysprosium, gadolinium, and neodymium, and the beginning of experiments to evaluate the commercial possibilities of the bureau's new electrolytic process for recovering high-purity titanium from scrap and other materials. The bureau also advanced research on conventional metals. Natural gas and coal were used successfully in an experimental blast furnace, and a method for making low-nickel austenitic stainless steel from offgrade ores was demonstrated. (See also CHEMISTRY; METALLURGY.)

Bureau studies of nonmetallic minerals included experiments with super-refractories that shed new light on the thermal properties of certain mineral salts. Development of methods for upgrading fire clays to improve their heat resistance was intensified, and additional knowledge was gained on the structure of asbestos.

Helium.—Completion of a new plant to extract helium from natural gas produced in Oklahoma's Keyes field was a major accomplishment in 1959. The plant, which began operating early in August, adds 290 million cubic feet a year to the government's helium-production capacity. The Interior Department in 1959 renewed its request to Congress for legislation that would establish a national helium-conservation program and permit recovery of helium now lost when it goes to fuel markets as a constituent of natural gas.

Fuels Research.—In 1959 the bureau completed

its part in a long-range cooperative study to determine estimates of future United States requirements for petroleum and natural gas, and to formulate plans for assuring adequate supplies of these essential fuels. Another cooperative program, under which the Bureau of Mines and the Atomic Energy Commission are exploring the feasibility of using nuclear explosives in mineral development, resulted in the government's proposal for a joint experiment with industry to evaluate the effects of detonating a small atomic device in an oil-shale formation. Industrial interest in such a test—which ultimately might lead to a means of extracting oil from shale without mining it—was generally high, and the two federal agencies began making preliminary plans for the experiment.

Bureau petroleum researchers devised new scientific instruments and techniques for which widespread future use is indicated. Two of these—a lightweight, battery-powered apparatus that can be used to detect and record radiation in remote areas where central power is unavailable, and a technique that employs foam generated by detergents to remove unwanted water from natural gas wells—attracted international interest. Another achievement was the development of a special container that permits use of the corrosive liquid metal, gallium, to gain greater accuracy in recording the characteristics of natural gas and other hydrocarbons under pressure.

Research on missile fuels was aided greatly by the bureau's determination of the nitrogen-fluorine bond energy in organic compounds. During the year, bureau scientists also made the first positive identification of a nonbasic nitrogen compound in petroleum. The compound (dibenzopyrrole) was separated from a California crude oil by chromatography and was identified by mass and infrared spectroscopy.

The bureau continued intensive research on coal extraction, preparation, and utilization during the year. Field experiments were begun on hydraulic mining of bituminous coal and in degasifying coalbeds (eliminating explosive methane) in advance of underground mining. A full-scale longwall-mining project aimed at developing a highly productive system for extracting anthracite from seams of moderate thickness and pitch remained active, employing a continuous mining machine imported from Germany. Research to find improved mining techniques for veins that pitch more steeply progressed with joint bureau-industry tests of a continuous borer-type machine with auxiliary loading and conveying equipment, a new-type auger for drilling crosscuts between gangways, and steel-arch roof supports.

Coal-preparation studies were directed toward improving methods for cleaning fine sizes of bituminous coal and toward producing a calcined anthracite that might substitute effectively for foundry coke. Preliminary investigations were made to determine the effects of radiation on both anthracite and bituminous coal.

Coal-utilization studies in the bituminous realm included a continuing cooperative project with the Atomic Energy Commission to determine whether nuclear heat can be used for economic production of synthesis gas from coal, and new research aimed at developing a coal-burning gas turbine for stationary power plant use. Anthracite-utilization research emphasized studies of the effects produced when anthracite is reacted with hydrogen as part of the gasification process.

Under the federal-state Anthracite Mine-Water Control Program, eight projects were approved by the secretary of the interior in the first half of 1959. The total cost, to be shared equally by the federal government and the Commonwealth of Pennsylvania, is estimated at $4.4 million. By late 1959, 21 projects had been undertaken at a total cost of $7.7 million.

Health and Safety.—Advances in mine safety in 1959 included commercial manufacture of a bureau-developed, portable mining face shield, and development by bureau research of a new methane-detecting device, small enough to be carried in a man's pocket and operated by one standard flashlight cell. At the same time, the bureau and industry sought a practical design for a continuous methane-monitoring system with automatic power shutoff for electrical equipment operated in face areas of coal mines.

Production of safety-education films for mineral industry workers was intensified in 1959, and enrollment in the bureau's various accident prevention courses increased. In the 1959 fiscal year, the bureau's 246 coal-mine inspectors made nearly 12,000 safety surveys of the nation's coal mines.

Foreign Activities.—The Bureau of Mines continued to provide industry and government with information on mineral developments in other countries and, through a series of special studies, obtained realistic appraisals of production, trade, and mineral potential in Communist nations. Bureau specialists gave technological aid on minerals problems to 15 countries, and 25 foreign scientists and engineers received training at bureau installations during the year.

Other Activities.—The Bureau of Mines in 1959 helped many federal, state, and private agencies solve problems of water and power supply, mine drainage, pollution, and inundation of mineral resources.

A noteworthy attainment in 1959 was the publication, by midyear, of seven volumes of the *Minerals Yearbook*, on which production had fallen behind during World War II. In addition, the bureau issued 337 other technical publications and produced some 260 articles for technical journals and scientific meetings.

Economic conditions of the domestic metal-mining industries and the domestic petroleum industry were studied during 1959 to obtain a sound basis for evaluating numerous plans proposed to Congress.

Executive.—Chief state officers in 1959:
Governor: Orville L. Freeman (Democrat)
Lieutenant Governor: Karl F. Rolvaag
Secretary of State: Joseph L. Donovan
Treasurer: Val Bjornson
Attorney General: Miles Lord
Auditor: Stafford King
Commissioner of Education: Dean M. Schweickhard

Constitution and Judiciary.—The present constitution went into effect in 1858. The Supreme Court comprises seven justices; chief justice in 1959 was Roger L. Dell.

Legislature.—The Minnesota Legislature comprises a 67-member Senate (in 1959, 43 Conservatives and 24 Liberals) and a 131-member House of Representatives (72 Liberals and 59 Conservatives), which meet in odd-numbered years commencing the first Tuesday after the first Monday in January.

Bitter disagreement over fiscal policy between the Conservative-controlled Senate and the Liberal-controlled House kept the 1959 Minnesota Legislature at the capitol

for six months. When the regular session ended on April 24 with most of the major bills still in committee, the legislature was forced into the longest extra session (48 legislative days) in the state's history.

A withholding plan for state income tax, supported by Gov. Orville L. Freeman and the Liberals, was the focus of controversy. The compromise tax package which was finally approved increased levies on personal and corporation incomes, beer and liquor, cigarettes and tobacco, inheritances, and iron ore to provide an estimated $47 million in additional revenue for the 1959–61 biennium, but the withholding plan was defeated. A record $498 million was appropriated for the biennium, an increase of $71 million over the preceding two years. Of this total, $113.4 million was for welfare and $292.7 million for education. A $51.8 million state building appropriation authorized construction of three new classroom buildings at the University of Minnesota, a new diagnostic youth center in Anoka County, and major additions to several state hospitals. To provide funds for the building program, the 1959 state tax on property was increased to 14.32 mills, the highest in Minnesota's history.

Other important laws among the 793 passed during the regular and special sessions authorize reapportionment of legislative districts (see below, *Principal Events, 1959*); require that every county furnish or arrange for the services of probation officers for juvenile offenders; establish statewide daylight saving time from the fourth Sunday in May through Labor Day; require that all boats on Minnesota waters be registered and safety precautions observed; and approve for submission to the voters in November 1960 four constitutional amendments affecting succession to the governorship, the basis for legislative reapportionment, residence requirements for voters, and lengths of legislative sessions.

Finance.—In the 1958–59 fiscal year, state revenue of $874,404,353.29 comprised $314,322,552.32 from state tax sources, $116,046,016.91 from the federal government, and $444,035,784.06 from other sources. Tax revenue consisted of $183,028,662.47 from selective sales and gross receipts taxes, $77,318,078.75 from individual income taxes, $26,355,432.36 from corporate income taxes, $19,918,876.98 from property taxes, and $7,701,501.76 from other sources. An additional $7,956,083.60 was obtained from licensing. Expenditures of $876,062,976.48 comprised $174,101,747.81 for education, $171,988,068.62 for health, welfare, and safety, $223,277,076.63 for highways, and $306,696,083.42 for all other purposes. Long-term indebtedness on June 20, 1959, amounted to $158,069,196.54.

Banking.—As of June 10, 1959, the state's 179 national banks had $2,917,330,000 in assets, $1,816,535,000 in demand deposits, and $774,556,000 in time deposits. The 505 state banks (June 30, 1959) had assets of $1,162,954,618.09, demand deposits of $518,628,085.09, and time deposits of $644,326,533.

Education.—School attendance is compulsory between the ages of 7 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $223,636,927 ($364 per pupil), and revenue comprised $103,163,870 from local school districts, $98,362,997 from the state, and $4,800,873 from the federal government. Outlays for construction and improvements amounted to $118,552,480, and teachers' salaries averaged $4,699 (high school, $5,038; elementary, $4,284).

MINNESOTA SCHOOL STATISTICS, 1957–58

Type of school	No.	Teachers	Students
Public elementary (1–6; 1–8)	2,915	13,768	338,998
Public secondary (7–9; 10–12)	670	12,770	244,591
Private and parochial elementary and secondary	563	4740	142,378
Public junior colleges	9	133	2,656*
Private junior colleges	2	...	453*
Teachers colleges	5	611	9,630*
Colleges and universities	17	...	43,214*
Other higher institutions	10	...	2,480*

*1958–59 school year.

Public Assistance.—In the 1958–59 fiscal year, state and federal funds spent for public assistance (excluding institutional costs) totaled $81,517,641, including $48,814,846 for the aged, $16,620,179 for dependent children, and $13,252,485 for general relief. A monthly average of 113,252 persons received public assistance.

Labor Force.—The state's labor force totaled 1,444,900 in August 1959, including 320,000 agricultural workers. An expected record in nonagricultural employment for 1959 was realized in mid-June when there were 932,579 persons in nonfarm positions. By August, nonfarm employment, because of steel and packinghouse strikes, declined to 919,000, although it remained above the 912,900 figure of the previous August and the 1958 average of 896,200. Unemployment amounted to 49,700 in August 1959, well below the 83,000 figure for the previous August.

Manufacturing.—The state's 5,000 manufacturing plants in 1958 employed an average of 218,200 persons who received $1,051,500,000 in wages. Value added by manufacture (1957) totaled $2,043,918,000, and outlays for new plant and equipment amounted to $101,880,000. Production workers averaged $91.78 for an average workweek of 40.8 hours during August 1959.

MAJOR MINNESOTA MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.* (thousands of dollars)
Food and kindred products	52,181	$234,628	$532,367
Nonelectrical machinery	32,135	147,476	255,658
Pulp, paper, and products	17,144	88,926	194,741
Printing and publishing	20,098	93,740	150,155
Chemicals and products	6,329	29,179	120,816

Primary metal industries	6,540	33,487	55,292

* For definition see footnote 1 in the article *Industrial Production*. (Source: *Annual Survey of Manufactures: 1957*.)

Mining.—Minnesota ranked 11th among the states in the value of its 1958 mineral output which, though 32% under that of 1957, accounted for 2.4% of the national total. Shipments of iron ore were the lowest since 1939, chiefly due to the reduced demand by the domestic steel industry. Taconite concentrate shipments reached 9 million long tons, 21% of the state's total output of iron ore, as against 10% in 1957. Ore production in 1959, though continuing highest in the nation, received a serious setback in July when the nation's steelworkers went on strike. It was estimated that some 22,000 Minnesotans became jobless in the mining, processing, and shipping phases of the iron ore industry.

MINNESOTA MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Coke	642,618	$ 14,834,820[1]
Iron ore, usable (long tons)	42,503,000	354,528,000
Manganiferous ore	370,603	...[2]
Sand and gravel	29,634,000	21,680,000
Stone	3,519,000	9,560,000
Other minerals	...	10,304,000
Total	...	$395,880,000[3]

[1] Values for processed materials are not included in the total. [2] Value included in "Other minerals." [3] Value has been adjusted to eliminate duplication of value of limestone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1959 dropped to $990,366,000 from $1,058,146,000 for the corresponding period of 1958. For the full year 1958, income comprised $1,074,873,000 from livestock and livestock prod-

MINNESOTA CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Barley (1,000 bu.)	29,356	30,960	29,174
Corn (1,000 bu.)	268,215	312,448	334,278
Flaxseed (1,000 bu.)	10,928	6,993	5,302
Hay (1,000 tons)	6,613	6,663	6,403
Oats (1,000 bu.)	186,255	211,464	176,673
Potatoes (1,000 cwt.)	8,960*	11,346	11,674
Rye (1,000 bu.)	2,072	1,170	1,026

Wheat (1,000 bu.)	16,202	25,345	23,287

* Average, 1949–57. (Source: U.S. Department of Agriculture.)

ucts, $392,879,000 from crops, and $41,720,000 from government payments. Principal income sources in 1958 were: cattle, $363,241,000; dairy products, $277,128,000; and hogs, $258,441,000.

There were 162,000 farms in the state in 1958. Total acreage (1954) of 32,285,000 included 19,493,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 3,973,000 cattle, 3,815,000 hogs, 765,000 sheep, and 21,185,000 chickens (excluding commercial broilers). There were 211,000 family and hired workers engaged in farming during the week of Nov. 22–29, 1959.

Transportation and Communications.—State and federal funds disbursed for trunk highways in the 1958–59 fiscal year totaled $107,637,106, and 472 miles of new construction were completed.

Highways and roads on Jan. 1, 1959, totaled 123,367 miles (112,319 surfaced). Registered *motor vehicles* numbered 1,583,062 on Sept. 30, 1958, including 1,174,688 passenger cars. There were (1958) 26 *railroads* operating 8,251.12 line miles and (1959) 7 regularly scheduled *airlines* and 400 *airports and airfields* (117 commercial and municipal and 283 private), in addition to 12 public and 64 private seaplane bases.

Communication media (1959) included 67 AM and 4 FM *radio stations;* 10 VHF *television stations;* 27 daily *newspapers* (circulation, 1,083,111) and 401 other newspapers (629,839); and (January 1) 310,100 business and 952,200 residential *telephones.*

Principal Events, 1959.—A sharp decline in tax revenue from iron ore mining created a serious financial problem for Minnesota in 1959. As a result of mine shutdowns during the 1958 business recession, iron ore taxes dropped $17.9 million for the fiscal year ending June 30. The overall decline ($5.6 million) in taxes collected by the state was larger than in any year since the depression period of the 1930's. The problem was intensified when Minnesota mines were again closed, from mid-July to mid-November, as a result of the nationwide steel strike (see IRON AND STEEL). It was estimated that the state lost $1.7 million in taxes each week during the strike.

The steel strike idled 30,500 Minnesota workers, largely in mining and transportation. Duluth and the Iron Range communities were hardest hit. There were two major labor disputes in the Twin Cities (Minneapolis and St. Paul) during the year. A strike-lockout closed Minneapolis grocery stores for 28 days in March. In November a 22-day strike against the Twin City Rapid Transit Company left the state's largest metropolitan area without public transportation for the first time since 1939. At Albert Lea, violence broke out in December at a meatpacking plant which had been struck by the United Packinghouse Workers since November 3. Governor Freeman declared martial law and on December 11 moved in National Guardsmen to close the establishment. A federal court on December 23 ordered it reopened, and four days later martial law was ended, although the dispute continued.

In the Minneapolis mayoralty election on June 10, P. Kenneth Peterson was returned to office for a second term, after a campaign in which city liquor licensing was the dominant issue.

The driest 20-month period ever recorded in the Twin Cities found the area short of normal rainfall by 14.57 inches on April 30. Normal to heavy rains during the late spring and summer replenished shrunken lakes and parched farmlands over much of the state, but drought conditions in western Minnesota continued to threaten agricultural production there.

Duluth formally marked the completion of the improved St. Lawrence Seaway with a week-long celebration in July. The first deep-draft ocean-going freighters had entered the Duluth Harbor on May 3, thus inaugurating a new era in world trade for the inland port. The $10 million Arthur M. Clure Public Marine Terminal was dedicated on July 11 in ceremonies presided over by U.S. Secretary of the Interior Fred A. Seaton.

After decades in which a deadlock between urban and rural interests prevented action, the 1959 Minnesota Legislature hammered out a compromise on reapportionment of state legislative districts. It authorized redistricting according to population (as presently required by the state constitution) for the 1962 election—the first such change since 1913. As a result, urban centers, particularly the Twin Cities, will gain heavily in representatives. At the same time the legislature approved a constitutional amendment, to be submitted to the voters in 1960, which would change the basis of representation in the Senate from population to area, beginning in 1971.

Legislature and Principal Events by:
JEANNE SINNEN,
Senior Editor, University Press, University of Minnesota.

MINT ESTABLISHMENT, U.S. The U.S. Mint, a bureau of the Treasury Department, administers laws dealing with the coinage of money and the purchase, sale, deposit, assay, refining, and custody of the government's stock of monetary gold and silver. The Mint also administers, in part, Treasury controls over the acquisition, ownership, possession, and use of gold and silver. The Office of the Director, in Washington, D.C., supervises operations of the mints in Philadelphia, Denver, and San Francisco (the latter now operates as an assay office and bullion depository); the gold bullion depository in Fort Knox, Ky.; the assay office in New York City; and the silver bullion depository at West Point, N.Y.

During the fiscal year ended June 30, 1959, the mints produced 1,575,712,736 United States coins, and 137,410,000 coins for Costa Rica, Cuba, Honduras, and the Philippines.

United States monetary stocks of gold and silver bullion in custody of Mint depositories at the close of the fiscal year 1959 were valued at approximately $22,027,000,000.

LELAND HOWARD,
Assistant Director of the Mint.

MIQUELON. See SAINT PIERRE AND MIQUELON.

MISSILES. The United States missile program has come a long way in the past few years. In 1955 the United States was far behind the Soviet Union in almost every phase of missile development, but by late 1959 it was judged to be about on a par with the USSR in most fields of missile development, including guidance systems, metals, instrumentation, and high-yield nuclear warheads. The United States remained clearly behind in high-thrust booster rockets and propulsion systems, but it had made some gains even in that field.

A budget-balancing administration and Congress, which held the defense appropriation for the fiscal year 1960 to $39.2 billion, forced major reductions in a number of missile programs, but sufficient funds were provided to enable the Department of Defense to continue its emphasis on development of advanced missile warfare. Increased funds were provided for intercontinental ballistic missiles, antimissile missile development, the Navy's fleet ballistic missile Polaris, and modernization of the Army's missile program.

A new defense master plan, announced in mid-1959, called for reductions in the Bomarc and Nike-Hercules surface-to-air missile programs, and resulted in a sharp cutback in funds for the Mace, an Air Force tactical missile. Additional funds

were granted for development of the Nike-Zeus antimissile missile, and funds were provided also to accelerate refinements and production of the Atlas intercontinental ballistic missile and its second-generation counterpart, the Minuteman.

During 1959, several missiles in different categories reached operational status, and were assigned to military units. A number of other missiles were far enough along in their development and test-firing programs to ensure their attainment of operational status in 1960.

(Note: This article is concerned with missiles which have a direct military application. For a discussion of rockets used in space research, see the article SPACE FLIGHT.)

GUIDED AND BALLISTIC MISSILES

Surface-to-Surface Missiles.—The first United States intercontinental ballistic missile (ICBM), the Atlas, joined the nation's growing missile arsenal in September 1959. The Atlas is designed to deliver a thermonuclear warhead more than 6,325 statute miles, and has been fired successfully at that range a number of times. Its first operational firing took place on September 9 at Vandenberg Air Force Base, Calif., where a squadron of 15 Atlas launchers is in combat-ready status. Six other Atlas bases were being built at the end of 1959. Authorities believed that the USSR had perhaps 10 to 30 operational ICBM's at the year's end, therefore surpassing the United States in long-range missile launching capability.

[1] Status code: O, for operational; P, in production, not yet operational; T, under test; D, under development. [2] Produced in France.

The Air Force's Titan ICBM, designed to complement the Atlas, made its first flight test early in 1959, and was expected to be approaching operational status by mid-1960. Larger and lighter than the Atlas, it is a two-stage missile launched initially by a 300,000-pound-thrust booster rocket. An advanced inertial guidance system is expected to give the Titan unusual accuracy at its full range of over 6,000 miles. At the end of 1959, five bases for Titan missiles were being built.

The first of the Air Force's second-generation ICBM's, the XSM-80 Minuteman, is scheduled for operational readiness in 1962 or 1963. Smaller, lighter, and considerably less expensive than the Atlas or Titan, it will be a highly sophisticated solid-fuel missile, incorporating the best features of earlier ICBM's. Its maximum range is 5,500 nautical miles (6,325 statute miles). When operational, Minutemen will be stored in underground bomb-proof silos, ready for instantaneous firing. The missiles will be fully transportable as assembled units from plants to launching sites.

At the end of 1959, the United States had two operational IRBM's (intermediate-range ballistic missiles): the Thor, developed by the Air Force; and the Jupiter, developed by the Army. The Thor, which became operational in September 1958, was judged the more reliable of the two missiles, with a probability of hitting target areas estimated at 80–90%. Now in full production, it is a single-stage missile and is transportable by air. Under study is a two-stage version, called Thoric, with intercontinental range.

The Army-developed Jupiter, the first United States IRBM to complete a guided flight over an extended distance (about 1,500 nautical miles) to a target area, became operational in 1959, and was deployed to overseas bases. Its all-inertial guidance system, erector, and launcher have features which permit both rapid movement between tactical firing positions (unidentifiable in advance by the enemy) and quick assembly prior to launching.

Development of the fleet ballistic missile Polaris, a missile of major importance for launching from submarines, neared completion in 1959. This solid-fuel missile underwent extensive component testing in 1959, and is scheduled to be ready for limited operation in late 1960, when the first Polaris-launching submarines will be ready. Considerably lighter and smaller than its land-based IRBM counterparts, Polaris will have an initial range of about 1,200 nautical miles, but by 1962 it should achieve its full range of 1,500 nautical miles with a reliability of over 90%. During 1959 several Polaris missiles were successfully test-fired from naval vessels at sea. It is possible that the Polaris may be adapted for firing from cruisers, land installations, and aircraft.

One of the newest surface-to-surface artillery missiles is the Lacrosse, which went into service with Army units in the summer of 1959. A tactical rocket with a range of 20 miles, it is designed to provide highly accurate support against enemy strongpoints, as well as for general support. It has a command guidance system and a solid-fuel rocket motor. Little John, a solid-fuel free-flight rocket, armed with either atomic or nonatomic

warheads, went into service in late 1959. Its range is about 10 miles, and its speed is supersonic. Designed to provide increased firepower for small, mobile combat units, it complements rather than replaces the Honest John, a long-range artillery rocket based in Europe and the Far East for several years. During the year, the Army let a contract for Missile A, scheduled to be the successor of Honest John and Little John. It will have a range of from 65 to 70 miles.

The jet-propelled TM-76 Mace, a relatively low-cost missile designed to replace the obsolescent Matador (also jet-propelled) at overseas Air Force bases, is expected to become operational in 1960. The Mace uses either an inertial guidance system or ATRAN (automatic tracking and navigation), a map-matching guidance system, depending on its mission. Its range of over 800 miles is substantially greater than that of the Matador (over 500 miles).

The Pershing, a selective-range two-stage ballistic missile, is under accelerated development by the Army as an eventual successor to the Redstone. Considerably lighter and smaller than its predecessor, it will have a high degree of mobility, a built-in guidance system, and a range of 700 miles. It will be armed with a nuclear warhead.

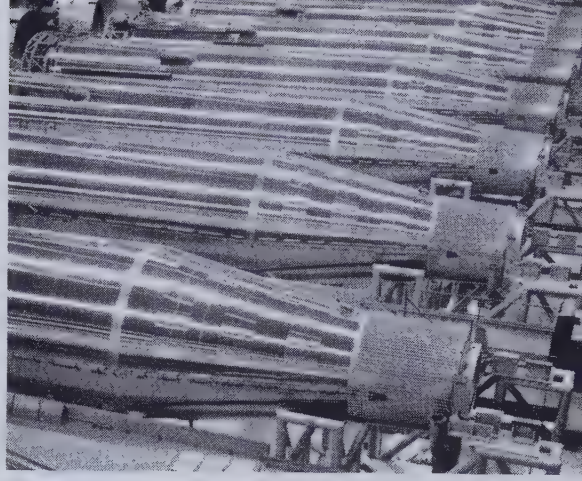
The Sergeant, a solid-fuel ballistic missile, will soon replace the Corporal. The Sergeant offers improved reliability, mobility, and accuracy as compared with its predecessor. It can carry either a nuclear or conventional warhead; it is air transportable; and it can be put in position and fired quickly by a small crew under all conditions of weather and terrain.

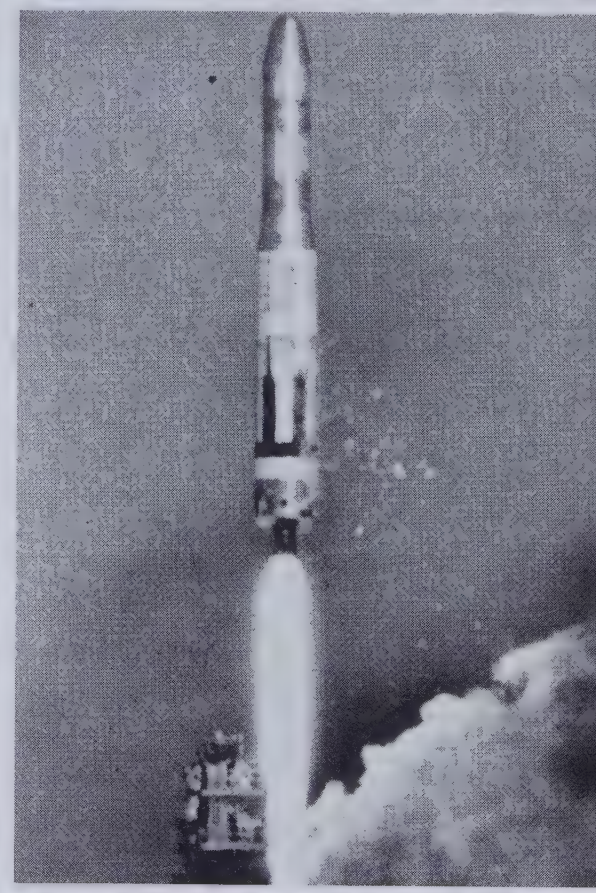
The Army's Dart antitank missiles are likely to be replaced by SS-10 and SS-11 solid-propellant wire-guided missiles, now in production in France. The jet-propelled Regulus II was canceled by the Navy in December 1958 after 90% of its development program had been completed.

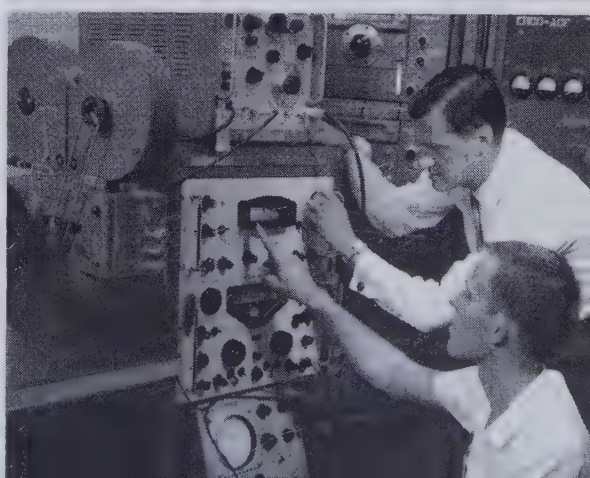
Surface-to-Air Missiles.—The Bomarc, a rocket-launched supersonic pilotless interceptor with a range of more than 200 miles, attained operational status in the fall of 1959. The Bomarc is designed to attack enemy bomber formations before they reach the vicinity of the target; its guidance equipment is tied in with the SAGE (semi-automatic ground environment) electronic communications system. The advanced Bomarc B, with a range of about 400 miles, has been ordered into production and should be operational in 1961.

The Army's liquid-propellant Nike-Ajax defensive missile is being replaced gradually by the solid-fuel Nike-Hercules, which has a range of about 80 miles and employs radar command guidance. The Nike-Zeus is an antimissile system being developed to intercept and destroy ICBM's in the last stage of their flight. A high-thrust solid-propellant power plant will boost the Zeus to speeds of about 5,000 mph.; its range will be about 200 miles. It is uncertain when the Zeus will attain operational status; there is even a possibility that it may never be ordered into production.

An advanced version of the Terrier surface-to-air guided missile went into production in 1959.







(*Top*) Atlas intercontinental ballistic missiles are assembled and checked on production line of San Diego, Calif., plant. (*Center*) The Titan ICBM rises from launching pad at Cape Canaveral, Fla., in its first test firing, February 6. (*Bottom*) New monitoring system (Project Tepee) is capable of detecting missile launchings and atmospheric nuclear explosions thousands of miles distant. Conceived by Dr. W. J. Thaler (standing) of the Office of Naval Research, the monitor reflects high-frequency radio signals from the ionized gas of rocket exhausts and from nuclear gas clouds, and in 1959 was used to record rocket firings within the Soviet Union.

CONVAIR; WIDE WORLD; U.S. NAVY

A two-stage solid-fuel rocket, it will be installed on missile cruisers, frigates, and nuclear-powered ships of several categories; and it also will be launched from mobile ground vehicles. The Tartar, a supersonic antiaircraft guided missile with a solid-fuel rocket motor, will enter service with the fleet in late 1960.

The Talos, a solid-propellant missile which became operational in mid-1959, can be used as an air defense missile, as a bombardment weapon, or as a long-range antisubmarine weapon (when equipped with a nuclear warhead). It employs beam-rider guidance and can reach targets at ranges of 65 miles and altitudes of over 75,000 feet. A Super Talos is being developed as an antimissile missile.

A new air defense weapon called the Hawk will join the Army's missile arsenal in 1960, complementing present Nike defenses. A mobile system for use in the field, it can be transported by helicopter or medium-size aircraft. It is effective at altitudes ranging from less than 100 feet to more than 38,000 feet. A special agency of the North Atlantic Treaty Organization (NATO) is being organized to produce the Hawk in five western European countries.

The Army's Plato, which aimed at providing a defense against ballistic missiles for battlefield troops, was canceled in mid-1959, presumably because of obsolescence; and the Air Force canceled the Goose, a turbojet-powered long-range surface-to-air missile.

Air-to-Surface Missiles.—The Air Force's only operational air-to-surface missile is the GAM-77 Hound Dog, which is powered by a turbojet engine and extends the capability of Strategic Air Command heavy bombers. Launched from a B-52G, the missile can deliver a nuclear payload on a target more than 500 miles away. The GAM-72 Quail, a diversionary or decoy missile to be air-launched from B-47 or B-52 bombers, was nearing operational status at the end of 1959.

The Zuni, designed primarily for use by fighter and attack aircraft against surface targets, but also usable against aircraft targets, has been approved by the Navy for operational use. The new air-to-surface Corvus has had a number of successful test firings at sea, and may join the fleet in 1960. Small enough to be used by carrier-based aircraft, the Corvus is designed primarily as a stand-off weapon. Near production is a Super Bullpup, with a 1,000-pound conventional warhead and a prepackaged liquid-fuel rocket engine. (The standard Bullpup has a solid-fuel motor and carries a 250-pound payload.)

Air-to-Air Missiles.—Five versions of the Air Force's Falcon air-to-air missile had been produced by the end of 1959, the latest being the GAR-3 and GAR-4. The GAR-3 employs semiactive radar-seeker guidance, while the GAR-4 has an infrared homing system. A new solid-propellant engine with greater burning time provides increased range and speed. The Air Force's Genie is an unguided rocket which travels at about four times the speed of sound and carries an atomic warhead. It is part of the armament of the F-89J, F-101B, and F-106 aircraft.

An advanced version of the Navy's Sparrow III, for launching from the F4H-1 supersonic all-weather fighter, is under development. Guidance is by radar homing. (Sparrow III has a range of 5 to 8 miles and a top speed more than 1,500 mph. in excess of the speed of the launching plane.) Also under development is the Sidewinder 1-C, which will have higher speed and greater range than its predecessors.

Future U.S. Missiles.—In 1959 the Air Force released a few details about its highly classified SLAM (supersonic low-altitude missile) developed under the code name of Project Pluto. The new missile is to have a nuclear-powered ramjet engine and an advanced electronic support system. It will be a surface-to-surface weapon with almost unlimited range. Also, the Air Force awarded a contract during the year for development of an air-launched ballistic missile which, if it meets expectations, could ensure the effectiveness of manned aircraft for an indefinite period. Designated the SGAM-87A, it will have a range of more than 1,000 miles. It is designed for firing from both the present Mach-2 B-58 and any forthcoming Mach-3 bombers, and it is seen as the progenitor of a missile launched from space craft.

The Army awarded a contract in 1959 for development of an infrared homing missile for use against low-flying aircraft. Called the Mauler, it is to be a highly mobile self-propelled missile system, capable of providing all-weather air defense for front-line troops. Joint development of a new surface-to-air, shoulder-fired guided-missile system called Redeye was initiated in 1959 by the Army and the Marine Corps. Fired from a bazooka-like launching tube, it can be carried by foot soldiers. A new family of "pocket" missiles, designed for limited nuclear warfare, is expected to result from the Army's Davy Crockett, a light nuclear-armed rocket designed to be fired like a rifle grenade by one or two men in the field. Another light-weight missile system being developed for close-in support of ground troops is the Army's Shillelagh. Expected to be operational in the mid-1960s, it is designed to provide greatly increased firepower (probably nuclear) against armor, troops, and fortifications.

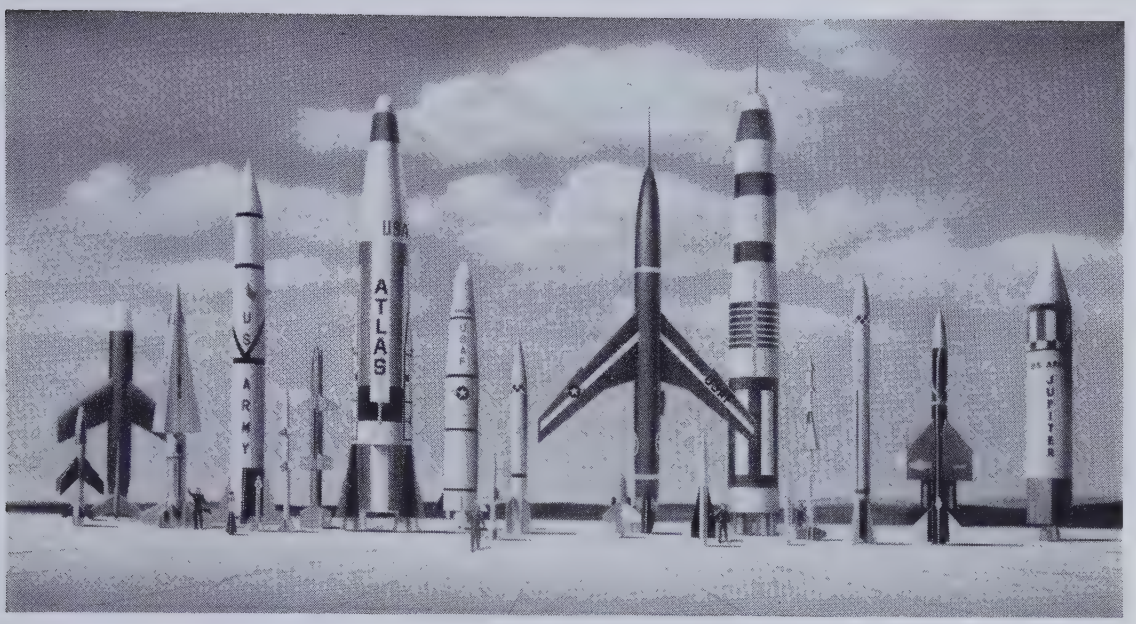
Still in the early stages of its long-range development is the Navy's Eagle air-to-air missile. This stand-off weapon will have long air-to-air range (about 100 miles) and can be fitted with a nuclear warhead. High performance will be built into the missile, enabling it to be fired from relatively slow launching aircraft.

The Navy has a research and development contract for Subroc, an antisubmarine missile which can be launched from above or below the surface, and associated equipment which can detect a submarine 25 to 50 miles distant, compute its course, and fire the missile. The Subroc is expected to be a defensive weapon for Polaris-launching submarines. The Astor (antisubmarine torpedo ordnance rocket) is a submarine-launched wire-guided, electrically propelled weapon carrying a nuclear warhead. The Asroc is a sophisticated antisubmarine rocket designed for launching from surface ships to seek submarines at longer ranges (up to 10 miles through air, plus limited underwater range) than were possible with the canceled Rat missile. An acoustic homing device provides underwater guidance. Also under development is a highly accurate, unguided, air-launched rocket called Gimlet.

The Air Force is developing Wagtail, an air-to-ground missile designed for greater penetration of defenses by means of low-altitude launching. The Crossbow, an adaptation of the drone aircraft to combat use, is designed to attack enemy defenses by homing on ground radar.

Under development for the Army is the cargo-carrying ballistic missile Lobber, designed to carry a 50-pound payload over a 50-mile range to test the feasibility of moving high-priority equipment to inaccessible areas via missile. The project could lead to missile transport of much larger payloads, ultimately including men.

Missile Development in Other Countries. *USSR.*—The Soviet Union, which started its missile research and de-



RAYTHEON COMPANY

Scale drawing of 21 major missiles in United States arsenal shows (left to right): Lacrosse, Mace, Nike-Hercules, Redstone (large rocket behind small Falcon and Sidewinder), Terrier, Talos, Atlas, Thor, Sparrow III, Sergeant, Quail, Snark, Hawk, Titan, Bullpup, Nike-Ajax, Corporal, Bomarc, and Jupiter. The Atlas became the nation's first operational ICBM in September.

velopment ahead of the United States, keeps pushing forward its missile programs. How effective its missiles are in comparison with those of the United States cannot be assayed with accuracy.

The USSR's two-stage T-2, an advanced weapon with a range of about 1,800 miles, is the mainstay of the Soviet missile arsenal. The T-3, like the U.S. Air Force's Atlas and Titan ICBM's, is designed to carry a nuclear warhead more than 5,000 miles; it became operational in 1959. Nearing full production status is an advanced version, the T-3A, with an estimated range of more than 6,000 miles and a velocity of 16,000 mph.

The J-2 is a radio-guided pilotless aircraft, adaptable as a surface-to-surface missile or antisubmarine weapon. Its range is about 525 miles and its speed is subsonic. An advanced version, the J-3, has swept wings, carries a one-ton warhead, and has a ramjet engine that gives it supersonic speed.

The M-2, similar to the Nike-Ajax but larger, with a range of 20 miles, is operational. Its speed exceeds 1,500 mph.

The Comet series of three surface-to-surface missiles comprises the 100-mile-range Comet I, in operational service; the 600-mile-range Comet II, with a greatly improved power plant and an inertial guidance system; and the 100-mile-range Comet III. Comet I can be launched from a submarine.

The T-6 is a surface-to-air weapon with a speed in excess of 1,500 mph. It is a two-stage solid-propellant missile, radar guided, with a high-explosive warhead. Also operational is the T-7A solid-fuel surface-to-surface missile, comparable to the U.S. Army's Corporal.

The Golem family of missiles is part of the Soviet naval arsenal. The Golem I is now obsolete. The Golem II, a two-stage liquid-propelled underwater-to-surface missile, is believed not yet operational. Its range is 1,200–1,500 miles, and it is launched from a towed underwater chamber. The solid-fuel Golem III, still in development, is a two-stage equivalent of the U.S. Navy's Polaris; its range is estimated between 1,500 and 2,000 miles.

Great Britain.—For IRBM's, Great Britain continues to rely on the United States-built Thor, but development of the first British IRBM, the Blue Streak, is going ahead approximately on schedule. Designed to carry a nuclear warhead over distances up to 2,000 miles, the Blue Streak is expected to become operational in the early 1960's.

In the surface-to-air category, the United Kingdom has two known missiles in production: the Bloodhound, for use by both the Royal Air Force (RAF) and the Swedish Air Force; and the Thunderbird, for use by the RAF and the British Army. The Bloodhound is a semiactive homing missile with built-in counterevasion capability. The Thunderbird is similar in performance and operational use to the American Nike-Hercules. Under development, and scheduled for operational status in the early 1960's, is the solid propellant Seacat, which is due to become the standard short-range weapon for the Royal Navy. A variant known as the Tigercat is being developed for land forces. Firestreak, an advanced air-to-air missile with infrared homing guidance and a range of about 8 miles, is in service with the RAF and is in production also for the Royal Navy.

France.—France has elected to concentrate its missile development and production on a variety of antiaircraft and antitank weapons. Its most successful missiles have been the wire-guided solid-propellant SS-10 and SS-11, for short-range battlefield use. The SS-11 has twice the SS-10's range of 1,650 yards, and higher speed. Capable of being launched from jeeps, tanks, or aircraft, the missiles are likely to be ordered as standard equipment for the U.S. Army. An improved version, the SS-12, is under development.

In the air-to-air category, the Nord 5103, sometimes called the "poor man's Sidewinder," is standard equipment with the French Air Force. To be produced in West Germany, it has a solid-propellant motor and a beam-rider guidance system.

The French government and aircraft manufacturers in 1959 established a new organization called the Société pour l'Etude et la Réalization d'Engine Balistiques, to push development and production of ballistic missiles.

Japan.—The Japanese Defense Agency decided in 1959 that Japan would have to rely for some time to come on missiles built in the United States. A tentative decision was reached to establish three guided missile units in Japan by 1962: a Bomarc B unit; a Nike-Hercules unit; and a Super Hawk unit. These, together with a supersonic fighter aircraft developed in the United States, would comprise the country's major defense elements.

West Germany.—West Germany has been chosen as the dominant partner in a six-nation NATO program to build the United States-developed Sidewinder air-to-air missile in Europe. West Germany also is participating in the five-nation $500 million Hawk program.

Italy.—Italy is producing the Oerone, a solid-propellant unguided surface-to-surface missile; the Orione Star, a limited-range surface-to-air weapon, and the C-7, a solid-fuel air-to-air missile using an infrared homing system. Under development is a family of unguided supersonic battlefield rockets named Robotti.

Missile Technology

Fuels.—With the range, speed, and payload capabilities of future additions to the United States missile arsenal so dependent on their propulsion systems, government and industry in 1959 spent millions of engineering and research man-hours in seeking more powerful, more efficient, and safer rocket fuels.

The nation's first and most widely used propellant, liquid oxygen, has been eclipsed in some major applications by less powerful but more versatile solid fuels. Solid propellants have assumed an increasingly important role in missile applications, except in cases where high specific impulse is the prime requirement for a mission. Thus, most new systems under development, including the Polaris, Minuteman, and Pershing, call for solid fuels.

Research and testing programs, however, have been pointing to the likely development of important new liquid propellants. Liquid hydrogen, de-

scribed by U.S. Air Force scientists as the "ultimate chemical fuel," is in large-scale production at three plants in the United States. Liquid hydrogen has an energy content of almost three times that of present fuels, and in combination with liquid oxygen gives an increase in thrust per pound of fuel expended of about 40% over present rocket propellants. Another chemical, liquid fluorine, possibly the most powerful of all known oxidizing agents, in 1959 was developed to the point where it could be used in large-scale thrust-chamber firings. Fluorine can be combined with existing fuels to produce propellant combinations capable of increasing the power output of existing rocket engines by 22 to 40%.

Defense Department plans for quantity production of high-energy boron were canceled in the summer of 1959 because of improvements in other fuels. Research is under way on a storable liquid monopropellant with a specific impulse higher than the approximately 260 pound-seconds per second specific impulse of present liquid propellants.

The Advanced Research Projects Agency (ARPA) has let a number of contracts for development of high-energy solid propellants with specific impulses of 280 pound-seconds per second. Another promising new development is a solid-fuel propellant containing aluminum in addition to the usual plastic materials. Research on solid fuels is being intensified by ARPA, which has a research and devolopment program (called Principia) aimed at obtaining a solid propellant with a specific impulse 10 to 20% greater than that of any solid fuel now known.

The National Aeronautics and Space Administration (NASA) is exploring the possibility of developing a new rocket propellant with both liquid and solid applications. This fuel would permit substantial increases in rocket payload, and its successful development would represent a major breakthrough in rocket fuels. (See also CHEMISTRY.)

Power Plants.—Most United States authorities were of the opinion that by late 1959 the United States had about caught up with the Soviet Union in nearly all phases of missile development except high-thrust rocket engines. In a move to remedy this last major lag, NASA was given control of design and development of all propulsion units for missile and space projects. Together with the earlier transfer to NASA of the Jet Propulsion Laboratory near Pasadena, Calif., and a portion of the research and development facilities of the Army Ballistic Missile Agency at Huntsville, Ala., this action placed NASA in a position both to go forward with a broad program of theoretical and experimental research on advanced rocket engines, and to play the major role in a proposed national rocket-booster program. Expected to contribute importantly to this program are new metals under development in 1959 that will be stronger, more heat resistant, and lighter than any used to date.

Guidance Systems.—The performance of the Atlas and the Thor in test firings in 1959 indicated that missile guidance systems now in use have been greatly improved in accuracy. Extensive research continued in this field, however, to attain at least a 90% probability that missiles would hit their target areas. In general, inertial guidance systems, predominant in today's guided missiles, have kept pace with overall missile development.

Consideration has been given to developing guidance units without reference to the missiles or space vehicles in which they would ultimately be used. This would mean a national guidance system program similar to the one proposed for propulsion units, resulting in a building-block concept that would allow designers to put units of a missile system together in whatever combinations they require.

Other Developments.—Both NASA and ARPA continue to study the basic physical phenomena associated with the re-entry of a ballistic missile nose cone into the atmosphere at hypersonic speeds. Nose cones are being improved as more heat-resistant materials come into use, and recovery of intact nose cones following long-range firings and re-entry are now commonplace.

Missile-tracking instruments designed to provide more precise and reliable data during missile firings are getting increased attention, and NASA and ARPA have a joint development program in this field. The new Azusa Mark II electronic tracking system, scheduled to go into operation at the Atlantic Missile Range early in 1960, is designed to measure changes in missile position of one tenth of a foot at distances hundreds of miles down-range from Cape Canaveral.

Also getting close attention is the early detection and tracking of enemy missiles. In this connection, the Navy in mid-1959 disclosed some details of Project Tepee, which holds promise of doubling the warning time for ballistic missiles launched in enemy territory. Based on the use of ionosphere backscatter from high-frequency radar transmitters, Tepee is considered capable of detecting the firing of missiles on the Eurasian land mass seconds after launching. Now in the research and development stage, Tepee could be operational in about three years—perhaps only a year after the Ballistic Missile Early Warning System (BMEWS) now under development. It is uncertain whether BMEWS will be rendered obsolete by Tepee. Project Midas, an early-warning satellite now under development, will not be affected by Tepee because it has other potential uses. The application of infrared devices to early detection of missile launchings is also under study.

Other areas of missile technology (including launchers, underground bases, transportation, fuel storage and handling, and electronics miniaturization) are the subjects of varied research and development programs, some of which are expected to yield results of considerable magnitude in the near future.

(For additional and related information, see ADVANCED RESEARCH PROJECTS AGENCY; NATIONAL AERONAUTICS AND SPACE ADMINISTRATION; SPACE FLIGHT; and the Index entry *Missiles*.)

KEITH SAUNDERS,
American Aviations Publications, Inc.

MISSISSIPPI. South Central state, United States; admitted to the Union, Dec. 10, 1817. The "Magnolia State" ranks 32d in area and 28th in population among the 50 states.

Area and Population.—Area: 47,716 square miles (land, 47,248; inland water, 468), divided into 82 counties. Population: (1950) 2,178,914; (est., July 1, 1958) 2,157,000. Urban places with 1950 populations above 10,000 are:

Biloxi	37,425	Laurel	25,038
Clarksdale	16,539	McComb	10,401
Columbus	17,172	Meridian	41,893
Greenville	29,936	Natchez	22,740
Greenwood	18,061	Pascagoula	10,805
Gulfport	22,659	Tupelo	11,527
Hattiesburg	29,474	Vicksburg	27,948
Jackson (*capital*)	98,271		

Executive.—Chief state officers in 1959:
Governor: James P. Coleman (Democrat)
Lieutenant Governor: Carroll Gartin
Secretary of State: Heber A. Ladner
Treasurer: Robert D. Morrow
Attorney General: Joe T. Patterson
Auditor: E. B. Golding
Supt. of Public Instruction: J. M. Tubb

Constitution and Judiciary.—The present constitution went into effect in 1890. The Supreme Court comprises nine justices; chief justice in 1959 was Harvey McGehee.

Legislature.—The Mississippi Legislature (Senate, 49 members; House of Representatives, 140) meets in even-numbered years commencing the first Tuesday after the first Monday in January.

Finance.—State revenue in the 1957–58 fiscal year totaled $262,397,067, comprising $162,585,000 in state tax revenue, $74,571,663 from the federal government, and $25,240,404 from other sources. Tax revenue consisted of $53,563,415 from a 3% general sales tax, $6,209,974 from individual income taxes, $12,473,339 from corporate income taxes, $40,743,451 from motor fuel taxes, $13,204,086 from licensing, and $36,390,735 from other sources. Expenditures of $247,976,269 comprised $73,537,846 for education, $60,347,075 for health, welfare, and safety, $64,154,844 for highways, and $49,936,504 for other purposes. Long-term indebtedness on June 30, 1958, amounted to $103,237,000.

Banking.—As of June 10, 1959, the state's 27 national banks had $367,465,000 in assets, $245,365,000 in demand deposits, and $89,595,000 in time deposits. The 164 insured commercial state banks had assets of $932,966,000, demand deposits of $634,082,000, and time deposits of $219,183,000.

Education.—Operating expenditures for public elementary and secondary education in the 1958–59 school year totaled $83,980,642.89 ($177.54 per pupil), comprising $35,775,753.87 from local school districts, $46,525,276.16 from the state, and $1,679,612.86 from the federal government. Outlays for construction and improvements amounted to $41,062,539.68, and teachers' salaries averaged $3,080.21 (high school, $3,405.30; elementary, $2,887.95).

MISSISSIPPI SCHOOL STATISTICS, 1958–59

Type of school	No.	Teachers	Students
Public elementary (1–8)	1,661	10,201	456,070
Public secondary (9–12)	628	6,236	113,762
Private and parochial elementary and secondary	47	746	18,303
Junior colleges	28	...	10,716
Colleges and universities	16	...	25,491

Social Welfare.—In the 1958–59 fiscal year, public assistance expenditures from federal and state funds (excluding institutional costs) totaled $42,410,881.01, including $28,688,109.81 for the aged, $8,490,720 for dependent children, and $2,656,908.20 for the needy blind. A monthly average of 146,968 persons received public assistance. The state spent $4,314,250 for mental health activities and $1,275,000 for correctional and penal programs.

Labor Force.—The insured labor force totaled 274,168 persons in March 1959. Nonagricultural employment was up to 257,766 from 241,049 a year earlier but slightly below the 258,105 average for the 12 intervening months. Of the March 1959 nonfarm total, manufacturing accounted for 44.5% and wholesale and retail trade for 26.1%. Unemployment as of Aug. 27, 1959, stood at 9,453, compared with 13,883 in the previous August. The state paid $11,585,023 in unemployment compensation during the 1958–59 fiscal year.

Manufacturing.—The state's 2,034 manufacturing plants in 1958 employed an average of 111,935 persons who received $366,915,741 in wages. Value added by manufacture (1957) totaled $615,566,000, and outlays for new plant and equipment amounted to $49,169,000. New plant investment alone in 1958 was $38,688,000. Production workers averaged $61.39 for an average workweek of 41.2 hours in August 1959.

MAJOR MISSISSIPPI MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.[1]
Pulp, paper, and products	8,240	$38,814	$98,369
Lumber and wood products	21,318	46,668	74,840
Food and kindred products[2]	11,017	31,118	73,979
Apparel and related products	22,327	49,430	69,812
Chemicals and products	5,084	19,803	61,962
Transportation equipment	5,468	26,151	52,144
Fabricated metal products	3,118	11,087	26,109
Stone, clay, glass products	2,758	9,431	25,090

[1] For definition see footnote 1 in the article *Industrial Production.* [2] 1956 data. (Source: *Annual Survey of Manufactures: 1957.*)

Mining.—In 1958 Mississippi ranked 23d among the states in the value of its mineral production, with 0.9% of the national total. Marked increases in the value of construction materials and natural gas sufficiently offset decreases in clay and petroleum output values to give the state a record production value. Second among the states in bentonite production, Mississippi accounted for 14% of the national output.

Agriculture.—Cash farm income for the first nine months of 1959 was up to $314,365,000 from $287,904,000 in the corresponding period of 1958. For the full year 1958, income comprised $266,152,000 from livestock and livestock products, $277,720,000 from crops, and $43,725,000 from government payments. Principal income sources in 1958 were cotton lint, $175,042,000; cattle, $124,688,000; and broilers, $46,872,000.

WIDE WORLD

Miss America honors go to a Mississippi college student for the second straight year as Lynda Lee Mead, 20, of Natchez, is crowned by the 1959 titleholder, Mary Ann Mobley of Brandon, in ceremony at Atlantic City on September 12.

MISSISSIPPI MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Clays	576,000	$ 3,338,000
Natural gas (1,000 cu. ft.)[1]	160,143,000	22,260,000
Natural gasoline (bbl.)	612,810	1,658,000
Petroleum (bbl.)[1]	38,551,000	110,256,000
Petroleum gases (bbl.)	219,238	503,000
Sand and gravel	6,545,000	6,240,000
Stone[2]	102,000	92,000

Wheat (1,000 bu.)	731	1,904	858

[1] Average, 1949–57. [2] Average, 1953–57. (Source: U.S. Department of Agriculture.)

There were 204,000 farms in the state in 1958. Total acreage (1954) of 20,702,000 included 5,530,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 2,363,000 cattle, 741,000 hogs, and 5,367,000 chickens (excluding commercial broilers). Some 399,000 family and hired workers were engaged in farming in the week of Oct. 18–24, 1959.

Transportation and Communications.—State and

federal funds disbursed for highways in the 1958–59 fiscal year totaled $70,113,501.57.

Highways and roads on Dec. 31, 1958, totaled 62,761.7 miles (14,140 surfaced). Registered *motor vehicles* numbered 653,571 on Oct. 31, 1958, including 465,580 passenger cars. There were (1958) 18 *railroads* operating 3,760 line miles and (1959) 4 regularly scheduled *airlines* and 80 *airports and airfields* (57 commercial and municipal, 4 military, and 19 other).

Communications media (1959) included 72 AM *radio stations;* 6 *television stations;* 19 daily *newspapers* and 114 other newspapers; and (January 1) 103,700 business and 281,600 residential *telephones.*

Principal Events, 1959.—Ross R. Barnett, attorney of Jackson, won the Democratic nomination for governor over three other candidates in the August primary elections. Barnett led his nearest opponent, Lt. Gov. Carroll Gartin of Laurel, by 3,441 votes in the first primary on August 4 and defeated Gartin by a margin of 36,074 votes in the run-off contest on August 25. The nominee had no opposition in the general election on November 3. Barnett, who had sought the office twice before without success, was elected on a platform advocating strict segregation of the races, increased support for education and social welfare, and reduced taxes on industry. The primaries, at which most state and county officials were chosen, attracted a record total of 439,720 voters.

Mack C. Parker, a Negro awaiting trial on an indictment charging criminal assault on a white woman on February 24, was taken from his cell in the Pearl River County jail at Poplarville by a mob in the pre-dawn hours of April 25, two days before his trial was scheduled to begin. An intensive search by local officers and agents of the Federal Bureau of Investigation, who were immediately called into the case by Gov. J. P. Coleman, resulted in the discovery on May 4 of the body of Parker, apparently the victim of gunshot. After four weeks of investigation, federal agents withdrew from the case and filed a report with the governor. This report was held in secrecy until just prior to the session of the Pearl River County Circuit Court in November, when it was turned over to the prosecuting attorney for submission to the grand jury. The grand jury, empaneled on November 2 by Judge Sebe Dale, heard no testimony concerning the investigation and returned no indictments. On November 6 the U.S. Justice Department petitioned a federal court for a grand jury investigation of the case, and on November 23 Judge S. C. Mize of the U.S. District Court announced in Jackson that a federal grand jury would be convened in Biloxi on Jan. 4, 1960, to consider the Parker case.

Lynda Lee Mead of Natchez, a student at the University of Mississippi, was chosen "Miss America" in the national beauty pageant on September 12, bringing this honor to the state for the second consecutive year.

On November 28 Governor Coleman called a special session of the legislature which convened on December 2. On the agenda were various matters thought to need attention before a new legislature assembles in January 1960.

C. N. FORTENBERRY,

The University of Mississippi.

MISSOURI. Central state, United States; admitted to the Union, Aug. 10, 1821. The " 'Show Me' State" ranks 19th in area and 13th in population among the 50 states.

Area and Population.—Area: 69,674 square miles (land, 69,226; inland water, 448), divided into 114 counties and the city of St. Louis. Population: (1950) 3,954,653; (est., July 1, 1958) 4,217,000. Urban places with populations above 10,000 in 1950 (unless another date is given):

Cape Girardeau	21,578	Maplewood	13,416
Carthage	11,188	Mexico	11,623
Clayton	16,035	Moberly	13,115
Columbia	31,974	Overland	11,566
Ferguson	11,573	Poplar Bluff	15,064
Fulton	10,052	Richmond Heights	15,045
Hannibal	20,444	St. Charles	14,314
Independence	36,963	St. Joseph	78,588
Jefferson City[1]	25,099	St. Louis	870,000[2]
Jennings	15,282	Sedalia	20,354
Joplin	38,711	Sikeston	11,640
Kansas City	456,622	Springfield	66,731
Kirksville	11,110	University City	39,892
Kirkwood	18,640	Webster Groves	23,390

[1] Capital. [2] Est., Jan. 1, 1958.

Executive.—Chief state officers in 1959:
Governor: James T. Blair, Jr. (Democrat)
Lieutenant Governor: Edward V. Long
Secretary of State: Walter H. Toberman
Treasurer: M. E. Morris
Attorney General: John M. Dalton
Auditor: Haskell Holman
Commissioner of Education: Hubert Wheeler

Constitution and Judiciary.—The present constitution went into effect in 1945. The Supreme Court comprises 7 justices; chief justice in 1959 was Frank Hollingsworth.

Legislature.—The Missouri General Assembly comprises a 34-member Senate (in 1959, 26 Democrats and 8 Republicans) and a 157-member House of Representatives (112 Democrats and 45 Republicans), which meet in odd-numbered years commencing the first Wednesday after the first Monday in January, and must adjourn by May 31.

At the 1959 session, Governor Blair recommended a list of reforms and a budget of $1,157 million for the biennium. He wanted a use tax and increased taxes on gasoline, liquor and beer, and cigarettes, and he suggested laws increasing the size and power of the state patrol, revising the criminal code to provide for indeterminate sentences, strengthening the mental health program, altering the drivers' license law so that the penalty point system could be used, and revising the mining code and the water law. The legislature approved a 2% use tax and the mining code revision, but it refused to pass the other recommendations, and it cut budget requests by about $7 million. While the public school foundation program was broadened by raising the grant per pupil from $110 to $130 and the flat grant from $75 to $102, the $26 million needed to finance expansion was not allowed. Other laws created a Crippled Children's Service, revised the state's judicial circuits, and increased welfare payments.

Finance.—In the 1958–59 fiscal year, state revenue of $502,338,851.55 included $289,385,994.54 from state tax sources and $186,510,469.53 from the federal government. Tax revenue comprised $105,001,464 from a 2% general sales tax, $43,033,019.27 from individual and corporate income taxes, $43,124,250.15 from motor fuel taxes, $51,844,914 from licensing, and $46,382,347.12 from other sources. Expenditures of $528,788,710.31 consisted of $117,485,955.69 for education, $163,919,174.22 for health, welfare, and safety, $160,217,824.75 for highways, $21,368,368.63 for capital improvements, and $65,797,387.02 for other purposes.

Banking.—As of June 10, 1959, the state's 75 national banks had $2,219,840,000 in assets, $1,624,469,000 in demand deposits, and $379,363,000 in time deposits. The 550 state banks had assets of $3,905,100,233.57, demand deposits of $1,982,535,096.13, and time deposits of $903,514,376.05.

Education.—School attendance is compulsory between the ages of 7 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $304,277,349 ($286.54 per pupil), comprising $191,694,730 from local school districts, $109,539,846 from the state, and $3,042,773 from the federal government. Teachers' salaries averaged $4,030 (high school, $4,369; elementary, $3,894).

MISSOURI SCHOOL STATISTICS, 1958–59

Type of school	No.	Teachers	Students
Public elementary (k–8)	1,713*	20,573	610,507
Public secondary (9–12)	541*	8,589	194,850
Junior colleges	15	606	6,695
Teachers colleges	6	681	16,113
Colleges and universities	20	8,625	51,606

* Districts.

Social Welfare.—Federal and state funds expended for public assistance (excluding institutional costs) in the 1958–59 fiscal year approximated $125 million. Major expenditures (during June 1959) were: $6,669,354 to 119,367 aged,

$2,342,740 to 25,985 dependent children, and $895,639 to 15,458 permanently and totally disabled persons. The state spent $18,936,000 in the 1958–59 fiscal year for mental health activities and $6,059,716 for correctional and penal programs.

Labor Force.—The state's labor force on June 30, 1959, totaled 1,815,800 persons, including 277,550 agricultural workers. Nonagricultural employment rose to 1,299,900 from 1,267,400 a year earlier and also exceeded the 1,271,900 average for 1958. Of nonfarm employees in 1959, 29.7% were engaged in manufacturing, 23.5% in trade, and 14.5% in government. Unemployment on June 30, 1959, was down to 102,100 from 165,600 on the previous June 30, and the state paid $37,775,518.72 in unemployment compensation during the intervening year.

Manufacturing.—There were 400,153 persons employed in manufacturing plants in the state during 1957 who received $1,757,697,000 in wages. Value added by manufacture totaled $3,294,752,000, and outlays for new plant and equipment amounted to $174,219,000. Production workers averaged $85.31 for an average workweek of 40 hours during August 1959.

MAJOR MISSOURI MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.* (thousands of dollars)
Transportation equipment	56,254	$306,139	$652,085
Food and kindred products	53,352	244,373	510,483
Chemicals and products	19,151	92,713	297,266
Nonelectrical machinery	25,844	124,786	226,480
Leather and leather goods	38,347	108,519	204,844
Fabricated metal products	23,702	113,462	203,198
Printing and publishing	26,750	124,824	202,996
Electrical machinery	25,261	118,086	193,828
Stone, clay, glass products	15,376	77,400	164,796
Apparel and related products	39,553	108,423	162,203

* For definition see footnote 1 in the article *Industrial Production.* (Source: *Annual Survey of Manufactures:* 1957.)

Mining.—In 1958 Missouri ranked 24th among the states in the value of its mineral output, with 0.87% of the national total. For the 51st consecutive year the state was foremost in output of lead. It was also first in barite and bituminous sandstone; second in cobalt, lime, and nickel; and third in fire clay. Of the total value of mineral output, nonmetals represented 69%.

MISSOURI MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Barite	199,268	$ 2,666,000
Cement (bbl.)	12,116,000	40,657,000
Clays	2,060,000	5,986,000
Coal	2,592,000	11,111,000
Copper	1,429	752,000
Iron ore, usable (long tons)	387,000	3,820,000
Lead	113,123	26,471,000
Lime	1,173,000	14,136,000
Sand and gravel	8,972,000	9,728,000
Silver (fine ounces)	251,000	227,000
Stone	24,276,000	32,878,000
Zinc	362	74,000
Other minerals	...	1,926,000
Total	...	$144,009,000*

* Total adjusted to eliminate duplication in the value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1959 dropped slightly to $712,058,000 from $722,998,000 for the corresponding period of 1958. For the full year 1958, income comprised $759,039,000 from livestock and livestock products, $333,380,000 from crops, and $61,141,000 from government payments. Principal income sources were cattle, $286,905,000, hogs, $248,579,000, and dairy products, $119,157,000.

There were 215,000 farms in the state in 1958.

MISSOURI CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	931	730	700
Corn (1,000 bu.)	155,480	180,712	257,345
Cotton lint (1,000 bales)	386	275	505
Cottonseed (1,000 tons)	166	118	218
Hay (1,000 tons)	4,103	5,428	4,102
Oats (1,000 bu.)	37,121	22,272	18,252
Popcorn (1,000 lb.)	20,641	35,420	18,500
Soybeans (1,000 bu.)	27,917	55,432	52,210
Strawberries (1,000 lb.)	7,230*	7,840	6,750
Tobacco (1,000 lb.)	4,998	3,185	4,350
Wheat (1,000 bu.)	35,537	40,488	37,950

* Average, 1949–57. (Source: U.S. Department of Agriculture.)

Total acreage (1954) of 34,195,000 included 12,336,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 4,098,000 cattle, 3,956,000 hogs, and 13,783,000 chickens (excluding commercial broilers). There were 253,000 family and hired workers engaged in farming during the week of Nov. 22–28, 1959.

Transportation and Communications.—State and federal funds disbursed for highways in the 1958–59 fiscal year totaled $160,217,824.75, and 275 miles of new construction were completed.

Highways and roads on Jan. 1, 1959, totaled 27,903 miles (19,866 surfaced). Registered *motor vehicles* numbered 1,728,909 on June 30, 1959, including 1,298,043 passenger cars. There were (1958) 20 *railroads* operating 7,132 line miles, and (1959) 9 regularly scheduled *airlines* and 233 *airports and airfields* (106 commercial and municipal, 3 military, and 124 private).

Communications media (1959) included 74 AM *radio stations;* 17 *television stations;* 60 daily *newspapers* (circulation, 1,816,142) and 311 other newspapers (357,487); and (January 1) 430,800 business and 1,174,000 residential *telephones.*

Principal Events, 1959.—While no general election was held in Missouri during the year, three local elections were of more than passing importance. A vacancy in the 4th Congressional District, caused by the death on January 23 of George H. Christopher, Democrat, was won on March 3 by William J. Randall, also a Democrat. Composed of parts of Kansas City and eight rural counties, the district is closely divided politically.

On March 31, Democratic organization candidates captured a majority of seats in the City Council of Kansas City, thus unseating the Nonpartisan Citizens Association, a reform group that had governed for 19 years. L. P. Cookingham, the city manager, who resigned on April 16, was replaced by Reed McKinley, but council members really took over the direction of city affairs. On November 3, the voters of St. Louis and St. Louis County defeated (2–1) a charter that would have set up a municipal district to take care of traffic, policing, sewage disposal, and other services for the metropolitan area.

Visitors stand in line to tour the birthplace of former President Truman at Lamar, Mo. The small white cottage was dedicated as a Missouri shrine in ceremonies on April 19.

WIDE WORLD

The growing season was a long one in 1959, and the result was high production of food crops, especially corn, which yielded 257.3 million bushels, as compared with 180.7 million in 1958. Livestock population was high, but a sharp decline in the price of hogs, eggs, and poultry reduced the income of Missouri farmers. Rural areas continued to lose population, while those around St. Louis and Kansas City continued to gain rapidly. Some cities in the southwestern part of the state had a good growth, and new industries moved into the region, whose power was increased by the completion of facilities at Table Rock Dam on the White River. This area also prospered because of an increase in tourism, which rose 38% over 1958, with nearly 2 million persons visiting the state parks. On April 19, the birthplace of ex-President Harry S Truman at Lamar was dedicated as a state shrine.

Retail business and manufacturing also showed improvement over 1958, and unemployment was low. The steel strike affected some industries, but it was not decisive. Iron and lead mines were being developed in newly discovered deposits in the southeast.

Tornadoes struck St. Louis in February and northwestern Missouri during the summer. The St. Louis tornado, which hit on February 10, cut a wide swath in the central part of the city, killing 21 persons, leaving many homeless, and destroying property worth $12 million. There were no severe floods during the year.

Construction at state universities and colleges and other state institutions, financed by a bond issue, went forward rapidly. Enrollment continued to rise sharply both in the colleges and in the elementary and secondary schools.

University of Missouri.

MITCHELL, James Paul, U.S. secretary of labor: b. Elizabeth, N.J., Nov. 12, 1900. Assistant secretary of the Army from May to October 1953 and a former labor relations executive in private industry, Mitchell was appointed secretary of labor on Oct. 8, 1953.

In spite of the nation's slow recovery from the previous year's economic recession, the labor secretary in the early spring of 1959 offered to eat his hat if employment did not exceed 67 million in October and if the unemployed numbered more than 3 million. On November 11, at the Labor Department Building in Washington, he ate a hat—a white fedora-shaped layer cake—but protested that if it had not been for the steel strike, employment would have been considerably higher than the actual figure of 66,831,000, and unemployment considerably less than 3,272,000.

Mitchell played an important part in obtaining a settlement of the dispute between the steel industry and the steelworkers' union on Jan. 4, 1960. (See IRON AND STEEL.) In the last stages of negotiation during late December, he and Vice President Nixon reportedly cautioned the steel companies that Congress might enact legislation unfavorable to them if the dispute continued and resulted in a resumption of the 116-day strike.

Early in 1959 he defended the administration's labor reform bill before the Senate Labor Subcommittee, which was also considering a competing bill sponsored by its chairman, John F. Kennedy. Of the two parts of the administration's bill that differentiated it from that of Senator Kennedy—the curbs on secondary boycotts and on coercive picketing—Mitchell said that without these curbs no bill "can claim to be a truly effective labor-reform measure." (See also LABOR.)

MOHAMMEDANISM. See the Index entry, *Islam.*

MOLYBDENUM. United States production of molybdenum (metal content of concentrates) decreased to 41,069,000 pounds in 1958, compared with 60,753,000 in 1957. The 1958 output was the lowest in seven years, chiefly because of the general industrial recession and a 12-week strike at the world's largest molybdenum mine in Colorado, according to the U.S. Bureau of Mines. In the first 10 months of 1959, domestic output of molybdenum concentrates was 43,023,000 pounds. In 1958 the United States supplied 73% of the world total of 56,500,000 pounds, compared with 80% of 76,200,000 pounds in 1957. Chile was the second largest known producer, with 2,972,000 pounds. In 1958, United States consumption was 24,231,000 pounds, compared with 30,016,000 pounds in 1957. Exports declined to 11,962,938 pounds of molybdenum ore and concentrate in 1958, compared with 25,465,515 pounds in 1957. Exports went largely to West Germany, France, and the United Kingdom. (See also CHEMISTRY; and for table showing output for major producing countries, see MINERAL PRODUCTION.)

MONACO. A principality on the Mediterranean shore of France. Area, 368 acres; pop. (1956 census), 20,442 (of whom a small minority are citizens). Chief towns are Monaco-Ville, La Condamine, and Monte Carlo. The language and currency are French. Prince Rainier III (acceded in 1949) is the ruler. There is an elected 18-member National Council which has limited powers. The administration is headed by a minister of state (a French citizen proposed by France and appointed by the prince); Emile Pelletier was approved as minister of state on Jan. 29, 1959. The budget for 1958 was: expenditure, 2,812,956; revenue, 3,179,639. The economy depends largely on income from tourism; the number of visitors spending at least one night in Monaco totaled a record 92,551 in 1957.

Following a dispute with the National Council over the council's demands for constitutional reform in the direction of greater popular government, Prince Rainier on Jan. 29, 1959, suspended the constitution, dissolved the National Council and the Monte Carlo Municipal Council, and banned all public meetings. The powers of the National Council were transferred to the Council of State, a judicial body; and the functions of the municipal council were taken over by a specially appointed eight-man delegation.

On June 18, Prince Rainier and Princess Grace were received in the Vatican by Pope John XXIII; on October 12 they arrived in Paris on an official visit. The prince on September 14 issued a regency decree declaring that in the event of his death, Princess Grace would serve as regent during the minority of Prince Albert, provided she did not remarry.

MONETARY FUND, International. See INTERNATIONAL MONETARY FUND.

MONEY. See Index entry.

MONGOLIA. A vast plateau region of east-central Asia between China and Soviet Siberia, traditionally divided into Inner Mongolia (q.v.) to the southeast, and Outer Mongolia (Mongolian People's Republic, q.v.) to the northwest.

MONGOLIAN PEOPLE'S REPUBLIC (OUTER MONGOLIA). A republic of east-central Asia, between

Soviet Siberia and China. Estimated area, 600,000 square miles; pop. (est. 1958), 1,040,000, chiefly Khalkha, with some Mongols, Kazakhs, and other groups. Ulan Bator (est. 160,000) is the capital and chief city.

Government.—Soviet influence has been paramount since the 1920's, although Communist China's role in the economic and other spheres has grown in recent years. The republic's application for membership in the United Nations has been opposed by the United States and other Western powers on the ground that Outer Mongolia is not a truly independent nation. The republic has diplomatic relations with 18 nations, including those of the Communist bloc, India, Indonesia, and certain other Asian and African countries.

The Great People's Khural, or People's Assembly, is elected every three years by universal suffrage. It chooses from its number a seven-member Presidium, which carries on current functions when the assembly is not in session. The chief political force is the Mongolian People's Revolutionary Party (Communist), the only political party in the country. Yumzhagiyn Tsedenbal, first secretary of the party, has been premier of the republic since 1952. The state budget for 1958 estimated revenue at 680.2 million tughriks; expenditure, 674.7 million (the tughrik equals the Soviet ruble).

Education and Religion.—Pupil enrollment in all schools totals about 100,000. Primary schooling lasts 4 years; in the larger towns, 7 years of schooling is obligatory. National Choi-Balsan University had 2,500 students in 1959; an agricultural institute, 700; and a teachers college, 500. Some 1,000 students study abroad, mainly in the USSR. Buddhism continues to exercise a strong influence on the people's attitudes and customs, although the revolutionary regime has closed many monasteries and closely controls the formerly powerful Buddhist Church.

Economy.—About three fourths of the population are nomadic stock raisers, and the vast herds of sheep, goats, cattle, yaks, horses, and camels (said to exceed 20 million head) constitute the country's chief wealth. The government has organized the herdsmen into producers cooperatives, establishing production quotas and requiring deliveries to the state and special labor tasks. Agriculture is still of minor importance, although cultivation of grains and other crops has been extended under state efforts. Industrialization, public works construction, and minerals development are proceeding with Soviet and Chinese aid. Chief manufactures are meat and dairy products, leather goods, sheepskin coats, woolen garments, and felt. Foreign trade, chiefly with the USSR and China, consists mainly of the export of animal products in exchange for equipment and other manufactures. Most internal transport is by camel. Railways (totaling 857 miles) and airlines connect the republic with the USSR and China.

Principal Events, 1959.—Premier Tsedenbal and Soviet Premier Nikita S. Khrushchev signed an agreement in Moscow on Feb. 10, 1959, providing for Soviet technical assistance and farm machinery for the opening of Outer Mongolia's virgin lands, and for technical aid in geological prospecting. In late March a heavy purge took place within Outer Mongolian political leadership, reportedly over the tempo and tactics of the government's collectivization and modernization program. Premier Tsedenbal in late August and early September headed an Outer Mongolian delegation which visited Communist China, North Vietnam, and India.

MONTANA. Northwestern state, United States; admitted to the Union, Nov. 8, 1889. The "Treasure State" ranks 4th in area and 41st in population among the 50 states.

Area and Population.—Area: 147,138 square miles (land, 145,878; inland water, 1,260), divided into 56 counties. Population: (1950) 591,024; (est., July 1, 1958) 675,000. Urban places with 1950 figures and 1956 local estimates are:

	1956 est.	1950 census		1956 est.	1950 census
Anaconda	18,100	11,244	Helena*	24,626	17,581
Billings	46,000	31,834	Kalispell	13,400	9,737
Bozeman	12,900	11,535	Miles City	11,000	9,243
Butte	40,000	33,251	Missoula	30,328	22,485
Great Falls	48,000	39,214			

*Capital

Executive.—Chief state officers in 1959:
Governor: J. Hugo Aronson (Republican)
Lieutenant Governor: Paul Cannon
Secretary of State: Frank Murray
Treasurer: Horace F. Casey
Controller: William F. Koch
Attorney General: Forrest H. Anderson
Auditor: John J. Holmes
Supt. of Public Instruction: Harriet Miller

Constitution and Judiciary.—The present constitution went into effect in 1889. The Supreme Court comprises five justices; chief justice in 1959 was James Harrison.

Legislature.—The Montana Legislative Assembly comprises a 56-member Senate (in 1959, 38 Democrats, 17 Republicans, 1 independent) and a 94-member House of Representatives (61 Democrats, 31 Republicans, 2 independents), which meet in odd-numbered years commencing the first Monday in January.

The Democratic 36th Legislative Assembly repudiated welfare-statism for rigid economy in government. Budgetary requests totaling $105 million were pared to $78 million, of which about $7 million was earmarked for anticipated deficits in the general fund and for expenses connected with the school foundation program.

Some $13 million in new revenue was provided for. About $10 million was to come from increases in personal income taxes ranging from 20% to 43%, but by an oversight, collections were not allowed during 1959. Other state income was based mostly on increases in existing corporation license taxes. Angry with the Republican governor for vetoing a weight-distance tax on trucks, the Democrats refused to increase the gasoline tax by 1 cent, thus leaving the highway construction program in great uncertainty.

Constitutional amendments setting up a separate Board of Regents to administer higher education, fixing four-year terms for city and county officers, and abolishing the Board of Prison Commissioners, will appear on the ballot in 1960. An amendment providing for a constitutional convention narrowly failed to pass. Also killed were bills for increased federal aid to the jobless, the establishment of public utility districts, and a "right to know" bill opening official meetings to the public.

The governor was made responsible for preparing biennial budgets, presidential primaries were ended, VHF television booster stations were encouraged, and the state prison was reorganized. A new insurance code was approved. The customary memorials criticizing federal Indian policy, calling for more federal dams, and defending the National Guard, were sent off to Washington.

Finance.—State revenue in the 1957–58 fiscal year totaled $145,309,812.88, comprising $52,464,840.89 from state tax sources, $51,310,380.20 from the federal government, and $41,534,591.79 from other sources. Tax revenue consisted of $9,300,926.30 from individual income taxes, $2,357,693.40 from corporate income taxes, $19,773,-207.91 from motor fuel taxes, and $21,033,013.28 from other state tax sources, including licensing. Expenditures totaling $153,511,483.42 comprised $18,563,284.47 for education, $14,434,963.08 for health, welfare, and safety, $55,739,474.64 for highways, and $64,773,761.23 for all other purposes. Long-term indebtedness on June 30, 1958, amounted to $36,591,000.

Banking.—As of June 10, 1959, the state's 41 national banks had $415,588,000 in assets, $179,391,000 in demand deposits, and $119,389,000 in time deposits. The 74 commercial banks had assets of $420,870,000, demand deposits of $267,572,000, and time deposits of $119,326,-000.

Education.—School attendance is compulsory between the ages of 8 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $64,-646,030 ($325 per elementary pupil and $438 per high school pupil). Revenues comprised $48,634,-864 from local school districts, $13,539,849 from the state, and $2,308,547 from the federal government. Outlays for construction and improvements amounted to $9,203,184, and teachers' salaries averaged $4,224 (high school, $4,755; junior high, $4,860; rural elementary, $3,137; city elementary, $4,142).

In the 1957–58 school year there were 1,097 public elementary schools with 4,573 teachers and 102,467 pupils, and 175 public high schools with 1,911 teachers and 34,365 pupils. College and university enrollment (1958–59) totaled 11,235 students.

Public Assistance.—Public assistance expenditures from federal and state funds (excluding institutional costs) in the 1957–58 fiscal year totaled $11,355,594.83, of which $5,764,086.84 was spent for the aged, $2,797,395.88 for dependent children, and $916,264.33 for the totally disabled. A

monthly average of 17,542 persons received public assistance.

Labor Force.—The state's labor force totaled 274,800 persons in June 1959, including 65,500 agricultural workers. Nonagricultural employment rose to 194,500 from 190,600 a year earlier and was well above the 158,700 average for 1958. Of wage and salaried workers in 1959, 23.3% were engaged in wholesale and retail trade, 12.1% in transportation, communications, and other public utilities, and 22.5% in government. Unemployment dropped sharply to 15,200 in June 1959 from 22,400 in the previous June. The state paid $12,928,825.74 in unemployment compensation during 1958.

Manufacturing.—There were 20,560 persons employed in the state's manufacturing plants in 1957 who earned $89,359,000 in wages. Value added by manufacture totaled $202,479,000, and outlays for new plant and equipment amounted to $19,998,000. Principal manufactures were food processing, with 4,168 employees earning $17,158,000, and with $48,776,000 in value added by manufacture, and lumber and wood products (6,895; $26,850,000; $46,358,000). Production workers averaged $92.30 for an average workweek of 38.3 hours in August 1959.

Mining.—In 1958 Montana ranked 22d among the states in the value of its mineral output, with 1.07% of the national total. It was first in production of arsenic, chromite, and vermiculite (the latter, supplied by one company, the major national source); and third in copper, fluorspar, and manganese. The Anaconda mines yielded 80% of the state's zinc output, and seven uranium operations were reported during the year.

MONTANA MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Chromite	119,057	$ ...[1]
Copper	90,683	47,699,000
Gold (fine ounces)	26,003	910,000
Lead	8,434	1,974,000
Manganese (35% and over)	53,123	4,036,000
Natural gas (1,000 cu. ft.)[2]	27,989,000	1,903,000
Crude petroleum (42-gal. bbl.)[2]	28,291,000	74,971,000
Sand and gravel	13,432,000	12,593,000
Silver (fine ounces)	3,630,000	3,286,000
Stone	1,545,000	2,214,000
Zinc	33,238	6,780,000
Other minerals	...	21,714,000
Total	...	$177,240,000[3]

[1] Figure withheld by producers. [2] Preliminary figure. [3] Total adjusted to eliminate duplication in values of clays and stone used in cement. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1959 rose slightly to $261,005,000 from $252,872,000 a year earlier. For the full year 1958, income comprised $242,277,000 from livestock and livestock products, $198,647,000 from crops, and $12,850,000 from government payments. Principal income sources in 1958 were cattle, $190,275,000, and wheat, $144,073,000.

MONTANA CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Barley (1,000 bu.)	24,847	52,239	52,250
Beans, dry edible (1,000 bags)	199	224	195
Corn (1,000 bu.)	2,914	3,168	3,239
Flaxseed (1,000 bu.)	506	320	126
Hay (1,000 tons)	2,759	2,996	3,009
Oats (1,000 bu.)	8,954	9,348	7,392
Potatoes (1,000 cwt.)	1,326*	1,410	1,320
Sugar beets (1,000 short tons)	680	839	834
Wheat (1,000 bu.)	90,092	101,882	82,090

* Average, 1949–57. (Source: U.S. Department of Agriculture.)

The state's 34,400 farms in 1958 had a total acreage of 66,500,000 (15,484,000 acres in harvested cropland). Livestock on farms (Jan. 1, 1959) included 2,269,000 cattle, 1,668,000 sheep, and 1,505,000 chickens (excluding commercial broilers). Some 41,000 family and hired workers were engaged in farming in late November.

Transportation and Communications.—State and federal spending for highways in the 1958–59 fiscal year totaled $55,971,842. During 1958, 470 miles of new construction were completed.

Highways and roads on Dec. 31, 1958, totaled 74,853 miles (27,349 surfaced). Registered *motor vehicles* numbered 388,416 on the same date, including 245,241 passenger cars. There were (1959) 9 *railroads* operating 4,946.5 line miles; 4 regularly scheduled *airlines;* and 420 *airports and airfields* (81 commercial and municipal, 2 military, 317 private, 8 state, and 12 federal).

Communications media (1959) included 34 AM *radio stations;* 7 VHF *television stations,* as well as 94 VHF repeater booster stations, 3 UHF repeater booster stations, and 16 cable companies; 15 daily *newspapers* (circulation, 519,110) and 80 other newspapers (150,170); and (January 1) 63,900 business and 167,400 residential *telephones.*

Principal Events, 1959.—The economy continued to recover from the setbacks of 1957–58 until well past midyear. Renewed confidence in the state treasury ($7 million behind when the year began) was shown by the sale at low interest rates of bonds to finance payment of bonuses to veterans of the Korean War. Unemployment was declining rapidly. In August, however, some 5,500 miners and smeltermen struck the Anaconda Company properties at Butte, Anaconda, and Great Falls. Within a short time, public welfare agencies were hard pressed, and by November the state unemployment figure was twice the seasonal average. An additional worry was the coincident decline of retail sales in rural areas. The finely balanced Democratic budget for 1959–61 (see above, *Legislature*) seemed likely to go awry.

There were other unpleasant surprises during 1959. On April 16 two ringleaders and a dozen or so followers seized control of the state prison at Deer Lodge, slew the assistant warden, knifed a guard, and menaced the warden until he escaped. Sixteen hostages were threatened with death by burning if reforms promised by the legislature after the prison uprising of 1957 were not carried out immediately. Describing the demands as a blind, the warden ordered an assault by National Guardsmen and Highway Patrol forces on the 18th. All hostages were saved. The ringleaders were found dead in a tower. In 1960 the voters will pass on a $5 million bond issue for new prison facilities.

At 11:35 P.M. on August 17 the great Madison Valley earthquake occurred (see SEISMOLOGY). Loss of life was presumed greatest where a mountain top tumbled into the Madison River below Hebgen Dam (see DAMS), about 25 miles northwest of West Yellowstone. An undetermined number of campers were trapped in the enormous slide. Nine certain deaths were reported. Institutions as far distant as the Deer Lodge prison were damaged, as were public buildings at Bozeman, Galen, and Virginia City. Total property damage was estimated at $11 million, of which about $6 million was replacement cost for Montana Highway 287 in the Hebgen area. The already crippled highway program had no matching funds available for reconstruction. State officials hoped to convert a liability into an asset by luring tourists to see the ruins.

In the spring, reform groups hailed the sale of eight Anaconda Company daily newspapers to the Lee enterprises of Iowa, and also the appointment of Harry K. Newburn to the presidency of strife-torn Montana State University in Missoula.

J. W. SMURR,
Assistant Professor of History,
Montana State University.

MONTREAL. Canada's largest city, Montreal is located on the St. Lawrence River in the Province of Quebec. Its estimated population in 1959 was 1,165,000 (1956 census, 1,109,439), of whom approximately 70% are French Canadian, making Montreal the second largest French-speaking city in the world (after Paris). Although the city itself, covering more than 50 square miles, is increasing in population, the most rapid growth is concentrated in some 50 suburban municipalities, which contain more than 650,000 residents.

The city's form of government, which is unique in Canada, is prescribed by a provincial charter. The Council, elected for three years, consists of a mayor and 99 members, with a 7-member Executive Committee exercising major administrative functions. For electoral purposes the city is divided into 11 districts, each of which has 6 representatives. One third of the Council is elected by property owners, and one third by the general voters. The remaining 33 councilors are nominated by 13 designated public and private bodies. Each group within the Council elects two members who, with the mayor, comprise the Executive Committee. (The party of Mayor Sarto Fournier, the Greater Montreal Rally, lacks a majority in the Council. New elections are due in October 1960.) Estimated expenditure for the city for 1959–60 was $155 million, of which $34 million was to be spent on education.

Montreal possesses the world's largest inland port, which, however, is closed by ice for several months of the year. With the onset of winter in 1958 a number of ships were trapped in the harbor by ice, but they were freed by icebreakers in mid-January 1959. The regular shipping season began again with the arrival of the first vessel from overseas on April 1, 1959. By the end of the season, some 170,000 passengers had passed through the port, as well as a record quantity of freight. Montreal is also a major port for lake and canal vessels and is Canada's principal grain port, with a storage capacity of 19 million bushels.

The headquarters of the two major Canadian railway systems are located in Montreal. The city's airport, which is being enlarged and equipped with new terminal facilities, is the principal international air center in Canada. Headquarters of the International Civil Aviation Organization and the International Air Transport Association are situated in the city.

Montreal is a major financial, manufacturing, and distribution center. Important commodities produced include aircraft, textiles and clothing, electrical supplies, gasoline and petrochemicals, and sugar. The city, located close to the main ski resorts of the Laurentian Mountains, provides a major attraction for tourists. There are two major universities, McGill University and the Université de Montréal.

The St. Lawrence Seaway (q.v.), the eastern entry of which is at Montreal, was brought into operation in 1959. Ships began moving through the canal in mid-April, but the ceremonial opening was deferred until June 26. The royal yacht *Britannia,* carrying Queen Elizabeth II and President Eisenhower, moved through the St. Lambert locks to perform the formal inauguration. The occasion was the chief feature of the 2½-day royal visit to the city.

The volume of construction in Montreal during 1959 broke all records. Much of this was concentrated on several major projects in the heart of the city. Work continued on the $60 million Place Ville-Marie project, and excavation was begun for the nearby Windsor Plaza. Plans were completed and funds were raised for the Place des Arts which is to group a large concert hall and two smaller theaters. The first tenants were installed in Les Habitations Jeanne Mance, Montreal's controversial slum-clearance and rehabilitation scheme. In the field of transportation, the Laurentian Autoroute was opened, leading from the city to the hill resorts to the north. The first eight miles of the east-west Metropolitan Boulevard were ready for use by the end of the year.

The year was marred by a severe epidemic of poliomyelitis which, in the Montreal region, involved over 900 cases and 43 deaths.

In March 1959 the provincial legislature enacted a law establishing the Montreal Metropolitan Corporation. This body contains representatives from the city and 14 suburban municipalities. It has few powers in its own right, but may assume functions by agreement among the municipalities. It is intended to form the framework of a system of metropolitan administration.

MOROCCO. A kingdom on the northwest coast of Africa.[1] Estimated area, 171,305 square miles; pop. (est. July 1, 1958), 10,330,000, mainly Berbers and Arabs. Europeans number about 500,000, chiefly French and Spanish; native Jews, about 200,000. Rabat (est. 160,000) is the capital. Other large cities and estimated populations are: Casablanca (700,000), Marrakech (220,000), Fez (180,000), and Tangier (180,000).

Government.—Political power derives solely from the throne. King Mohamed V has stated his aim as the evolution of Morocco toward a constitutional monarchy (the country's first elections are scheduled for 1960). There is an advisory National Consultative Assembly of 76 members appointed by the king. A ministry, headed by a premier, is responsible to the king. Abdallah Ibrahim heads a nonparty ministry fomed on Dec. 23, 1958. The Istiqlal (Independence) Party has been the leading political force since the nation became independent, but in 1959 was split into a left and right wing.

Education and Religion.—School facilities are available for less than half the school-age children, and an estimated 80% of the population is illiterate. Primary schools in 1957 had 615,838 pupils; secondary schools, 33,091; and 15 technical schools, 6,059. Koranic schools continue to exist, although the newly independent government has taken steps to modernize the school system with French aid. Morocco's first modern university was inaugurated at Rabat in 1957. Fez remains the center of religious learning. The majority of the population are Moslems; Roman Catholics predominate among the Europeans, and there is a sizable native Jewish community.

Finance.—The administrative budget for 1959 was estimated at 140.9 billion Moroccan francs (132.8 billion in 1958). The development budget for 1959, as presented on May 11, called for expenditures of 36.9 billion francs; about half of this was to come from United States aid and the remainder out of profits from the phosphate monopoly, sale of development bonds, and other domestic sources.

[1] Morocco attained independence in 1956. It was formerly divided into the French Zone (area, 150,888 sq. mi.; pop. 1956, 8,580,000); the Spanish Zone (area, 7,589 sq. mi.; pop., 1,068,000); and Tangier (area, 135 sq. mi.; pop., 175,000). The former French and Spanish zones were ruled as protectorates; Tangier was under international administration. In 1958, Spain transferred to Morocco sovereignty over the Southern Protectorate of Morocco (area, 12,693 sq. mi.; pop. 1950, 5,878), which had also been known as the Northern Zone of Spanish West Africa.

United States aid in the fiscal year 1959–60 was to total $40 million in the form of a long-term, low-interest loan for the building of roads, irrigation, and modernization of agriculture. On Oct. 16, 1959, the Moroccan franc was devaluated from 420 to the U.S. dollar (at the official rate) to 506 to the dollar; at the same time a new currency unit, the dirham, was introduced, equal to U.S.$0.1976 (or 5.06 dirhams to the dollar). On July 1, 1959, the Bank of Morocco came into being as the national bank of issue and the fiscal agent of the government.

Production.—French enterprise and capital have hitherto played the dominant role in the modern sector of the economy. Following the attainment of independence in 1956, Morocco was faced with the problem of obtaining capital for investment, as well as skilled technicians and managerial personnel. Since there had been little development of a Moroccan middle class and the small upper class of landholders was little inclined toward entrepreneurship, the task of modernizing the economy devolved mainly on the government. In 1959, steps were taken to establish a National Bank for Industrial Development, with an initial capitalization of 2 billion francs (half to be subscribed by the government), to offer medium- and long-term loans to industrial enterprises. Plans were also formulated for a 5-year development program, in which state initiative would play the dominant role.

The government's chief efforts, however, have been directed toward raising the low living standards and output of the tillers and stock raisers who comprise some 75% of the total population. Under Operation Plow the government has organized over 100 rural centers in which small peasant plots are worked cooperatively, with the government providing seed, fertilizer, tractors, and modern tools. Output of cereals in the former French Zone in 1958 (about 75% over the extremely poor 1957 yield) included 40 million bushels of wheat, 58.4 million of barley, and 14.5 million of corn. Other important crops are: oranges (11.5 million boxes, 1958 prelim.); flaxseed (863,340 bushels in 1959); olive oil (25,000 metric tons from the 1958–59 crop); and vegetables, sorghum, almonds, oilseed, dates, esparto grass, and tobacco. Large herds of sheep and goats yield meat, wool, hides, and dairy products. Sardines are important in the fish catch, which totaled 145,100 metric tons in 1957.

Manufacturing accounts for about 15% of national income. Industries, centered mainly around Casablanca, include foodstuffs, chemicals, construction materials, metallurgy, textiles, footwear, tobacco products, and glassware. Carpets, rugs, leather goods, and other traditional handicraft items are important. Mining employs over 35,000 persons and is an important source of exports. Chief minerals and output in 1958 were: phosphates, 6,336,000 metric tons; iron ore, 1,538,400; manganese ore, 353,800; and lead ore, 136,700.

Foreign Trade.—Exports in 1958 totaled 145,098 million francs; imports, 168,532 million. Chief exports were phosphates and other minerals, fish products, wine, fresh and dried vegetables, and other agricultural products; imports: sugar and other foodstuffs, petroleum products, vehicles and parts, textiles, and other manufactures. France purchased about 50% of Morocco's 1958 exports and provided about 45% of imports.

Transportation and Communications.—Morocco's railroad network totals 1,170 miles, much of which is electrified. Main roads aggregated 6,830 miles in 1957, and there are about 20,000 miles of inferior grade roads. Air transport is provided by Royal Air Maroc (founded in 1957) and by international lines operating mainly out of Casablanca. Passenger cars numbered 138,000 in 1958; telephones, 128,133; and radio receiver licenses, 431,000 (1957, in the former French Zone only).

Principal Events, 1959.—The outbreak of rebellion by Berbers of the northern Rif Mountains in October 1958 appeared to have been met successfully by the Royal Army in January 1959. The rebellious tribesmen, who demanded greater Moroccan support of the Algerian rebels and a more aggressively nationalistic attitude toward France, seized control of areas around Alhucemas in late 1958 and early 1959. Following the expiration of a 48-hour ultimatum given to the rebels on January 5 by King Mohamed V, the Royal Army, under the command of Crown Prince Moulay Hassan, used tanks and aircraft to clear the main highways and relieve the city of Alhucemas, which had been cut off for several days by the rebels.

The long-smoldering conflict within the Istiqlal, the country's dominant political force, broke out into the open on January 25, when left-wing leaders split off from the party's executive committee and assailed the party as weak and moribund in the face of the difficult problems confronting the nation. The leftist spokesmen, who were backed by Premier Abdallah Ibrahim, included Mehdi Ben Barka, speaker of the National Consultative Assembly, Mohammed El Basri, leader of the unofficial Moroccan Liberation Army, and Mahjoub Ben Seddik, head of the Moroccan Trade Union Federation. Under Mehdi Ben Barka's leadership, a new political front, the National Union of Popular Forces, was established at Casablanca on September 6. The new group, terming itself "the spokesman of the masses," demanded nationalization of certain sectors of the economy, accelerated agrarian reform, evacuation of foreign troops, and an end to "colonialism" in the economic and other spheres.

Among the problems for which the leftists demanded more decisive action was the widespread unemployment in urban areas (estimated at 20% of the urban labor force), and the even greater underemployment in rural areas. On October 31, King Mohamed V inaugurated a new program of land reform by distributing parcels of state land to 293 peasant families in the area of Sidi Kacem. Under the program, which is part of the government's effort to modernize agriculture, the state retains ownership of the land but provides the peasants with seed, fertilizer, and tools. On November 24, Minister of the Economy Abderrahim Bouabid announced a five-year development plan (to go into effect in 1960), projecting expenditures of about $50 million for the building of roads and other public works, the creation of state-controlled utilities and other basic industries, and the improvement of the rural economy by the fostering of peasant cooperatives.

The 1957 Royal Charter for Tangier, which afforded the former international city certain privileges of a free money market and other advantages, was revoked by a government decree of Oct. 17, 1959. Measures were taken, however, to preserve Tangier's free port status after April 18, 1960 (the effective date of the revocation). A royal decree of May 27, 1959, effective beginning in 1960, ended all radio broadcasting other than that of the state radio. A Voice of America transmitter in Tangier continued to operate, however, pending a United States–Moroccan agreement as to its status.

An issue of importance in the domestic sphere, as well as regards relations with France, was the devaluation of Moroccan currency and Morocco's membership in the franc zone. Fearing possible dislocating effects on the Moroccan economy, Moroccan leaders did not follow France's 17.55% devaluation of the franc on Dec. 27, 1958. To prevent a flight of capital to other members of the franc zone, Morocco on Jan. 12, 1959, imposed a 10% tax on monetary transfers. This measure proved ineffective, however, and Morocco was forced to devaluate. On October 16 a new Moroccan currency unit was announced—the dirham (equal to 100 Moroccan francs), with an official value of U.S.$0.1976; thereby the Moroccan franc, which continued in use, was devaluated from its former official rate of 420 to the dollar, to 506 to the dollar. To counter the effects of the devaluation, strict price controls were established on major consumer goods.

Moroccan actions in the monetary sphere (including the establishment on July 1 of a new bank of issue to replace the French-controlled Banque d'État du Maroc) were seen as a victory for the leftists in their efforts to free the Moroccan economy from its financial dependence on France. As a result of these actions, however, considerable uncertainty attached to Morocco's status within the franc zone. Other sources of contention which clouded Moroccan-French relations in 1959 were Moroccan ties with the Algerian nationalist rebels,

activities of the irregular Moroccan Liberation Army in the southern Sahara, Moroccan opposition to the projected French nuclear detonation in the Algerian Sahara, and Moroccan demands for the evacuation of French forces (estimated at about 20,000), whose presence in Morocco dated from the former protectorate regime.

Morocco's relations with Spain took a turn for the better in 1959, when the two countries established a joint commission to settle differences between them. Prisoners taken by Spanish forces and by the Moroccan Liberation Army in the 1957 fighting around Ifni were released by both sides in May. Spanish forces in the former Spanish Zone of Morocco were steadily reduced during the year, and by the end of 1959 were reported to number only about 5,000.

It was in its relations with the United States, however, that the newly independent nation recorded its most heartening achievement of the year—a settlement of the issue of the United States-occupied airbases in Morocco. In addition, an agreement was signed on June 30 for $40 million in much-needed United States aid, and in early November the Royal Army received a small gift-shipment of United States arms.

The four United States-built strategic airbases (at Nouaseur, Ben Slimane, Sidi Slimane, and Benguérir) and the naval airbase at Kénitra (formerly Port Lyautey) had been obtained under a United States–French agreement of 1949, during the period of the French protectorate. When Morocco became independent in 1956, it refused to recognize the agreement and demanded that the United States evacuate the bases. Protracted negotiations produced only United States acceptance in 1958 of the principle of withdrawal. During a visit to the United States from Oct. 11–Nov. 1, 1959, Premier Abdallah Ibrahim took up the matter in talks with President Dwight D. Eisenhower and other leaders in Washington, and reportedly returned to Rabat with a more definite United States commitment on withdrawal. It was during President Eisenhower's visit to Casablanca on December 22, however, that the announcement was made of a concrete agreement on withdrawal. In the communiqué on the president's talks with King Mohamed V, it was stated that the United States would release the airfield at Ben Slimane before March 31, 1960, and that United States forces would be entirely withdrawn from Morocco by the end of 1963.

MOTION PICTURES. In 1959, instead of exhibiting the usual vague Pollyanna certainty of success, film makers showed an optimism that was based on determination and an apparent knowledge of where they were going. Fewer films were made during the year (230, as compared with 600 during the lush period before 1950), but the films were more costly and the financial returns greater. The motion picture industry no longer considered television as an enemy-ogre, but recognized it as a medium to work with in some respects and to compete with in others.

General Trends.—Although motion picture executives were slow to admit that television has changed their business, they finally have met the younger medium's challenge head-on. All the major studios, except Paramount, made some movies in 1959 for hour and half-hour television programs, and most of the studios owned their own television stations. In addition, all the film makers watched with interest the experiments in subscription television, a form of transmission that could one day greatly increase the movie-making business. However, the possible success of subscription television was regarded with apprehension by the owners of motion picture theaters. Already the number of these theaters in the United States has dropped to 15,000, and, of those remaining, only the drive-ins (of which there are some 4,000), the newly renovated four-wall theaters, and the smaller art houses prospered.

Theater managers clamored for more films and deplored the decrease in Hollywood's output, especially since this decrease was mainly in low-budget pictures which theaters prefer for their double bills. The shortage became acute whenever expensive pictures failed at the box office, or when the exhibitor used two costly films on a double-feature program. Fortunately for the theaters, business picked up considerably during the summer of 1959, due, no doubt, to the release then of many attractive films and the decline of good television, as well as to the fact that the good pre-1948 films sold to television had been exhausted. Weekly average attendance at American motion picture theaters in 1959 rose to 51 million (40 million in 1958).

TV Sale of Post-1948 Films, and Labor Disputes.—Prior to 1959, all the major studios had sold or leased their pre-1948 films to television. Although some of the companies doubted the advisability of selling to a competitor, they appreciated the advantages of cash-in-hand to tide them over the lean period. The big problem confronting all studios in 1959, including the small independent producers who had no agreement on selling to television, was what to do with the enormous post-1948 library of pictures. Some of the companies were interested in selling, but they were deterred by the doubtful wisdom of supplying good products to a competing entertainment, and, more importantly, by the interference of unions and labor, which demanded a share of the proceeds on the sale of the post-1948 films. Primarily over this issue, the membership of the Writers Guild of America started a strike against independent producers in October 1959, and later authorized a strike, if necessary, against the major studios. By year's end, though contracts were reached with some independents, no final settlement was in sight; moreover, the Screen Actors Guild threatened to join the writers.

Communism.—Money, however, was not the only concern of the Writers Guild. It also asked that producers not be allowed to withhold screen credits because of a writer's political beliefs. This request came about because certain writers, as well as some actors, directors, producers, and other artists, who were formerly blacklisted as suspected Communists and fellow-travelers, were being used secretly, sometimes under pseudonyms, to work on films. When the American Legion accused the motion picture business of permitting its reinfiltration by Communists, Hollywood executives at first answered the accusations boldly, but later compromised (and confused) the issue. The Academy of Motion Picture Arts and Sciences, however, stood by its guns and refused to deny an Academy Award to anyone who is voted to receive one, regardless of his political ties.

Censorship.—The question of freedom of expression came up many times during 1959. Hollywood film makers, long accustomed to placating the Catholic Legion of Decency, found themselves under fire from another quarter: the Protestant National Council of Churches of Christ in the

U.S.A. The council charged that films too often "overemphasize sex for sex's sake and violence for violence's sake." Well aware that several films being made (like *Elmer Gantry* and *Rachel Cade*) were uncomplimentary to ministers, Hollywood was rather feeble in its answer that the public decided at the box office what it wanted and that no group had a right to censor the industry.

Furthermore, motion pictures were having official censorship problems. Although the U.S. Supreme Court ruled that New York State could not ban the showing of *Lady Chatterley's Lover* on the grounds that the "picture advocates an idea—that adultery under circumstances may be proper behavior," the court did not eliminate the state's censorship law entirely. The film makers themselves are of a divided opinion about censorship. On the one hand, they deplore pre-release censorship; on the other, they fear police actions against films and harassment by local judges. Further, they are doubtful about having a system similar to Great Britain's, in which some films are labeled "for adults only." In the long run, producers prefer the current, haphazard method of self-imposed censorship, known as the Production Code. (See also CENSORSHIP.)

New Films, 1959.—During 1959 many films appeared that had subject matter that would have been considered too daring in the years when the Production Code was followed strictly. Some of these were artistic, well-acted dramas that approached their unusual subjects seriously: *Compulsion,* with its story about two homosexuals, the murder they committed, and their trial; *Anatomy of a Murder,* with its frank dialogue about a rape that led to murder; *Suddenly, Last Summer,* with its shocking flashback revealing homosexuality and cannibalism; *Middle of the Night,* with its candid story of a middle-aged man and his love for a young divorcee; and *The Sound and the Fury,* with its dissection of a gone-to-seed Southern family. Others had little more to offer than sensationalism: *A Summer Place, Blue Denim, The Best of Everything, The Blue Angel,* and *Some Came Running.*

Also, there were many fine dramas with outstanding productions and performances: *The Nun's Story,* with Audrey Hepburn and a first-rate supporting cast; *The Diary of Anne Frank,* with a good cast led by Joseph Schildkraut as Anne's father; and *The Last Angry Man,* in which Paul Muni and David Wayne excelled. There were pictures especially designed for women: *Imitation of Life,* with Lana Turner, and *Woman Obsessed,* with Susan Hayward. Some films were failures in spite of their good casts and their being based on famous works: *Lonelyhearts* (from a Nathanael West novel), *Green Mansions* (from W. H. Hudson's nature story), and *The Devil's Disciple* (from G. B. Shaw's play).

Deciding that "Westerns" were being done to death on television, Hollywood made fewer of these in 1959, but did produce several with star-studded casts, magnificent scenery in color, and subject matter that was concerned with social problems as well as gun play: *The Hanging Tree, Last Train from Gun Hill, Warlock,* and *Rio*

(*Top to bottom*): (1) Kim Novak and Fredric March in a scene from Paddy Chayefsky's *Middle of the Night*. (2) Stephen Boyd (l.) and Charlton Heston as two charioteers in the famous race from *Ben-Hur*. (3) In the courtroom scene from *Anatomy of a Murder*, James Stewart (l.), an attorney, interrupts Lee Remick and George C. Scott while Joseph N. Welch, the judge, listens intently. (4) Sammy Davis, Jr. (l.) is the villainous Sportin' Life, Dorothy Dandridge is Bess, and Sidney Poitier is Porgy in the film version of George Gershwin's American folk opera, *Porgy and Bess*.

COLUMBIA; MGM; COLUMBIA; COLUMBIA

Bravo. The subject of bravery was the main theme of other outdoor dramas: *The Horse Soldiers* and *They Came to Cordura.*

While a few of the war films, such as *Pork Chop Hill, Up Periscope,* and *The Last Blitzkrieg,* concentrated on combat, most of them were comedies, like *Operation Petticoat* and *Don't Give Up the Ship,* or postwar farces about men in uniform, like *The Perfect Furlough, A Private's Affair,* and *It Started with a Kiss.* The year's best war films, *The Journey* and *The Diary of Anne Frank,* were more concerned with the effects of war on noncombatants. Outstanding among films of this type was Stanley Kramer's excellent production, *On the Beach,* which told about Australians and a few Americans who waited for the annihilation of mankind by radioactive fall-out after World War III. This well-acted and frightening film, designed to make people think seriously about nuclear warfare and the irresponsible use of atom bombs, had simultaneous premières in 18 cities throughout the world, including Moscow. Also dealing with atomic energy and the consequences of war was the fine United Nations documentary, *Power Among Men,* which placed its faith in man's will and ability to survive.

Harry Belafonte's film, *The World, The Flesh and the Devil,* was also concerned with radiation survivors, and, while it had beautiful scenes of the three last people (one Negro and two whites) wandering around a completely deserted New York City, it never really came to grips with the racial question it proposed. Other films stating Negro-white racial problems merited attention: *Odds Against Tomorrow, Take a Giant Step,* and an import from England, *Sapphire. The Young Land* was a historical drama pleading for equality and understanding between Californians and Mexicans in 1848.

Most of the historical dramas were expensive blockbusters done with elaborate sets and beautiful color photography displayed on wide screens. Outstanding among these was the $15 million *Ben-Hur,* which was not only the year's foremost spectacle (and, perhaps, the best spectacle ever made), but also a penetrating picture with a religious theme. *Ben-Hur's* well-directed cast, carefully written script (which improved on Lew Wallace's novel), and handsome production made for the success of this thoughtful, artistic, though lengthy, movie. The year's other religious-historical spectacles, also expensive, ran only second-best in comparison: *The Big Fisherman, Solomon and Sheba,* and *The Miracle.* Two big historical movies with star casts won only minor approval from the critics: *John Paul Jones* and *The Buccaneer.*

Biographical films were not outstanding in 1959. *The Naked Maja* (about Goya and his model), *Beloved Infidel* (about the love affair between F. Scott Fitzgerald and Sheilah Graham), and *The Gene Krupa Story* were neither critical nor box-office successes. The best biographical pictures were the realistic *Al Capone,* and the handsome musical, *The Five Pennies,* in which Danny Kaye portrayed Red Nichols.

Musicals in 1959 were only so-so affairs; for example, *Say One for Me, Li'l Abner,* and *Never*

(*Top to bottom*): (1) Peter Finch, as a doctor in a jungle mission hospital, with Audrey Hepburn in *The Nun's Story.* (2) Ava Gardner and Gregory Peck in *On the Beach,* based on Nevil Shute's novel about atomic annihilation. (3) In *Pillow Talk,* Rock Hudson carries inebriated Nick Adams as Doris Day looks on. (4) Millie Perkins, in the title role of *The Diary of Anne Frank,* and (l. to r.) Joseph Schildkraut, Gusti Huber, Lou Jacobi, Shelley Winters, Richard Beymer, and Diane Baker, watch from their attic hideaway as Allied bombers fly over Nazi-occupied Amsterdam.

WARNER BROTHERS; UNITED ARTISTS; UNIV.-INTL.; 20TH CENTURY-FOX

Steal Anything Small. The late Mario Lanza's fans applauded him in *For the First Time,* and admirers of George Gershwin's *Porgy and Bess* approved of the excellent recordings in the film version of the folk opera. However, *Porgy and Bess,* made with a good all-Negro cast by Samuel Goldwyn, attracted music lovers but annoyed cinema enthusiasts for its stagey presentation.

The year saw many comedies, most of which relied on sex and off-color jokes for their entertainment: *The Mating Game, Some Like It Hot, A Hole in the Head, But Not for Me, Count Your Blessings, Happy Anniversary,* and *Ask Any Girl.* The best comedy was *Pillow Talk,* in which Rock Hudson and Doris Day gave amusing performances that won applause.

Although there were many adventure films, only a few stood out from the routine: Alfred Hitchcock's *North by Northwest, The Wreck of the Mary Deare, The F.B.I. Story,* and *Third Man on the Mountain.* The latter was made by Walt Disney, whose cartoon film, *Sleeping Beauty,* was also released in 1959. Another full-length cartoon was Stephen Bosustow's *1001 Arabian Nights,* but neither this nor *Sleeping Beauty* was considered to be among the best of their producers' work.

AromaRama.—Technical innovations were few in 1959, although improvements in color photography and wide-screen processes were greeted with approval. Perhaps the most talked-about innovation was AromaRama, the first motion picture system to offer scents as well as sights and sounds. *Behind the Wall,* a well-made documentary on present-day China, was presented in AromaRama, and the viewer-smeller was able to experience the fragrance of flowers, spices, and incense. Olfactory reactions to other smells were mixed. The total impression created by the new gimmick was that scents with movies were more distracting than enlightening, and it remained to be seen if the installation costs of "smellies" were worth the entertainment values.

Foreign Films and Markets.—While exhibitors complained of the shortage of American films, they welcomed imports from abroad. Some of these played throughout the United States, but most of them were shown mainly in art-cinema houses in metropolitan centers. Outstanding among the foreign-language films were: *Nine Lives,* from Norway; *Eighth Day of the Week,* from Poland; *Wild Strawberries* and *The Magician,* from Sweden; *The Roof,* from Italy; *Aparajito,* from India; and *Embezzled Heaven,* from Austria. Britain sent over many films, including a hilarious comedy, *The Mouse That Roared,* and two highly considered serious dramas about the "angry young men": *Look Back in Anger* and *Room at the Top.* Pictures made by the French version of the "angry young men" (in France, the "New Wave") were startlingly frank in their treatment of sex, but also artistic and thoughtful in their handling of mature stories. The best French imports included *The Cousins, Back to the Wall, The Lovers, The 400 Blows,* and *Black Orpheus.* Russian films were also shown in the United States in 1959, and the much-discussed United States–USSR cultural exchange agreement—by which the Soviet Union agreed to buy ten selected American films, and the United States agreed to buy seven selected Russian pictures—was started late in 1959 with the showing of *The Cranes Are Flying* in Washington, and *Marty* in Moscow.

American film makers relied more than ever on foreign markets, and over half of their profits in 1959 came from abroad. Furthermore, partly to use these profits and partly to take advantage of appropriate locales and cheap labor, American companies produced more than 35% of their films abroad. Although American unions objected, producers said that some spectaculars had to be made abroad, or not at all.

While the motion picture industry changed greatly in the 1950–60 decade (both the competition from television and the rise of independent producers contributed to the decline of the major studios and to a smaller number of productions), it was evident that more changes were to come. However, film makers expressed confidence in the future, and, apparently, motion pictures would continue to be a dynamic art, whether presented in theaters or transmitted over the airwaves.

Motion Pictures of 1959

Listed here are films released in the United States in 1959; and while this list covers less than half of the year's pictures, it represents a cross section of the motion pictures made throughout the world. Because contributors to a single film are not now limited to one country, the nationality labels indicated below are not absolute. In most cases, however, the country named is that of the major contributors to the film.

American Films

Al Capone (Allied Artists). Producers, John. H. Burrows and Leonard J. Ackerman; director, Richard Wilson; screenplay by Malvin Wald and Henry Greenberg. With Rod Steiger, Fay Spain, Murvyn Vye, James Gregory, Martin Balsam, Nehemiah Persoff.

Alias Jesse James (United Artists). Producer, Jack Hope; director, Norman McLeod; screenplay by William Bowers and Daniel D. Beauchamp. With Bob Hope, Rhonda Fleming, Wendell Corey, Jim Davis.

Anatomy of a Murder (Columbia). Producer-director, Otto Preminger; screenplay by Wendell Mayes, from the novel by Robert Traver. With James Stewart, Lee Remick, Ben Gazzara, Joseph N. Welch, Arthur O'Connell, Eve Arden, Kathryn Grant, George C. Scott, Brooks West.

Anna Lucasta (United Artists). Producer, Sidney Harmon; director, Arnold Laven; screenplay by Philip Yordan, from his stage play. With Eartha Kitt, Sammy Davis, Jr., Frederick O'Neal, Henry Scott, Rex Ingram, Georgia Burke, James Edwards.

Ask Any Girl (MGM). Producer, Joe Pasternak; director, Charles Walters; screenplay by George Wells, based on the novel by Winifred Wolfe. With Shirley MacLaine, David Niven, Gig Young, Rod Taylor, Jim Backus, Claire Kelly, Elisabeth Fraser.

The Beat Generation (MGM). Producer Albert Zugsmith; director, Charles Haas. With Steve Cochran, Mamie Van Doren, Ray Danton, Fay Spain, Louis Armstrong, Maggie Hayes, Jackie Coogan, Jim Mitchum, Cathy Crosby, Ray Anthony, Dick Contino, Charles Chaplin, Jr.

Behind the Great Wall (Continental). Producer, Leonardo Bonzi; director, Carlo Lizzani; written and adapted for AromaRama by Sidney Kaufman and Thomas Orchard; narrated by Chet Huntley.

Beloved Infidel (20th Century-Fox). Producer, Jerry Wald; director, Henry King; screenplay by Sy Bartlett, from the book by Sheilah Graham and Gerold Frank. With Gregory Peck, Deborah Kerr, Eddie Albert, Philip Ober.

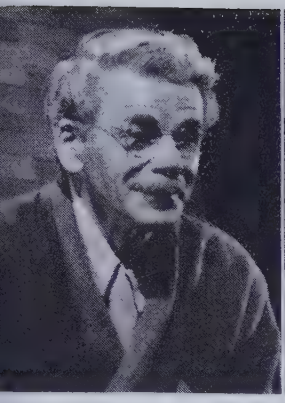
Ben-Hur (MGM). Producer, Sam Zimbalist; director, William Wyler; screenplay by Karl Tunberg, with additional dialogue by Christopher Fry, based on the novel by Lew Wallace. Musical score by Miklos Rozsa. With Charlton Heston, Jack Hawkins, Stephen Boyd, Haya Harareet, Hugh Griffith, Martha Scott, Cathy O'Donnell, Sam Jaffe, Ralph Truman.

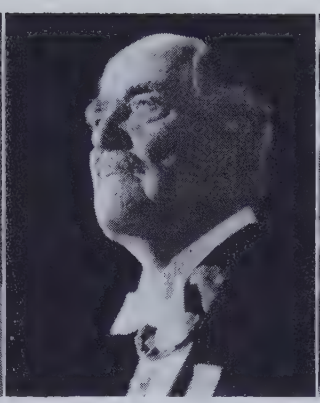
The Best of Everything (20th Century-Fox). Producer, Jerry Wald; director, Jean Negulesco; screenplay by Edith Sommer and Mann Rubin, from the novel by Rona Jaffe. With Hope Lange, Stephen Boyd, Suzy Parker, Louis Jourdan, Joan Crawford, Martha Hyer, Diane Baker, Brian Aherne, Robert Evans.

The Big Circus (Allied Artists). Producer, Irwin Allen; director, Joseph M. Newman. With Victor Mature, Red Buttons, Rhonda Fleming, Kathryn Grant, Vincent Price, David Nelson, Gilbert Roland, Peter Lorre.

The Big Fisherman (Buena Vista). Producer, Rowland V. Lee; director, Frank Borzage; screenplay by Howard Estabrook and Rowland V. Lee, based on Lloyd C. Douglas' novel. With Howard Keel, Susan Kohner, John Saxon, Martha Hyer, Herbert Lom, Ray Stricklyn, Alexander Scourby, Beulah Bondi.

The Black Orchid (Paramount). Producers, Carlo Ponti and Marcello Girosi; director, Martin Ritt; screenplay by Joseph Stefano. With Sophia Loren, Anthony Quinn, Ina Balin, Jimmie Baird, Mark Richman, Naomi Stevens, Frank Puglia.





COLUMBIA; 20TH CENTURY-FOX; VELDE; 20TH CENTURY-FOX

Outstanding film performances in 1959 were given by (left to right): Paul Muni, in *The Last Angry Man*; Margaret Leighton, in *The Sound and the Fury*; Victor Sjöström, in the Swedish film, *Wild Strawberries*; and Orson Welles, in *Compulsion*.

The Blue Angel (20th Century-Fox). Producer, Jack Cummings; director, Edward Dmytryk; screenplay by Nigel Balchin, based on the 1930 German screenplay which was based on Heinrich Mann's novel *Professor Unrath*. With Curt Jurgens, May Britt, Theodore Bikel.

Blue Denim (20th Century-Fox). Producer, Charles Brackett; director, Philip Dunne; screenplay by Edith Sommer and Philip Dunne, based on the play by James Leo Herlihy and William Noble. With Carol Lynley, Brandon de Wilde, Macdonald Carey, Marsha Hunt, Warren Berlinger.

The Buccaneer (Paramount). Producer, Henry Wilcoxon; director, Anthony Quinn; screenplay by Jesse L. Lasky, Jr., and Berenice Mosk, from Lyle Saxon's *Lafitte the Pirate*. With Yul Brynner, Claire Bloom, Charles Boyer, Charlton Heston, Inger Stevens, Henry Hull, E. G. Marshall.

But Not for Me (Paramount). Producers, William Perlberg and George Seaton; director, Walter Lang; screenplay by John Michael Hayes. With Clark Gable, Lilli Palmer, Carroll Baker, Lee J. Cobb, Barry Coe, Thomas Gomez.

Career (Paramount). Producer, Hal Wallis; director, Joseph Anthony; screenplay by James Lee, from his stage play. With Anthony Franciosa, Dean Martin, Shirley MacLaine, Carolyn Jones, Joan Blackman, Robert Middleton.

Compulsion (20th Century-Fox). Producer, Richard D. Zanuck; director, Richard Fleischer; screenplay by Richard Murphy, from the novel by Meyer Levin. With Dean Stockwell, Bradford Dillman, Orson Welles, Diane Varsi, E. G. Marshall, Martin Milner, Richard Anderson.

Count Your Blessings (MGM). Producer-writer, Karl Tunberg; director, Jean Negulesco. Based on Nancy Mitford's *The Blessing*. With Deborah Kerr, Rossano Brazzi, Maurice Chevalier, Martin Stephens, Tom Helmore, Ronald Squire, Patricia Medina, Lumsden Hare.

Crime and Punishment, U.S.A. (Allied Artists). Producer, Terry Sanders; director, Denis Sanders; screenplay by Walter Newman, from the novel by Fyodor Dostoevsky. With George Hamilton, Frank Silvera, Mary Murphy, Marian Seldes.

Darby O'Gill and the Little People (Buena Vista). Producer, Walt Disney; director, Robert Stevenson; screenplay by Lawrence Edward Watkin, suggested by H. T. Kavanagh's stories. With Albert Sharpe, Janet Munro, Sean Connery, Jimmy O'Dea, Kieron Moore, Estelle Winwood, Walter Fitzgerald.

Sapphire (Universal). English film. Producer, Michael Relph; director, Basil Dearden; screenplay by Janet Green. With Nigel Patrick, Yvonne Mitchell, Michael Craig, Paul Massie, Bernard Miles, Earl Cameron, Gordon Heath, Olga Lindo, Harry Baird.

The Scapegoat (MGM). English film. Producer, Michael Balcon; director, Robert Hamer; screenplay by Gore Vidal and Robert Hamer, from the novel by Daphne du Maurier. With Alec Guinness, Bette Davis, Nicole Maurey, Irene Worth, Pamela Brown, Geoffrey Keen, Peter Bull, Annabel Bartlett.

The Silent Enemy (Universal). English film. Producer, Bertram Ostrer; director-writer, William Fairchild. Based on *Commander Crabb* by Marshall Pugh. With Laurence Harvey, Dawn Adams, John Clements, Michael Craig, Gianna Maria Canale, Arnoldo Foa, Massimo Serato.

The Sins of Rose Bernd (President Films). German film. Producer, Hans Abich; director, Wolfgang Staudte; screenplay by Walter Ulbricht, from the play by Gerhart Hauptmann. With Maria Schell, Raf Vallone, Kathe Gold, Hannes Messemer, Leopold Biberti.

Sisters (Artkino). Russian film. A Mosfilm production; director, Grigory Roshal; screenplay by Boris Chirskov, based on Alexei Tolstoy's novel *Ordeal*. With Rufina

Nifontova, Nina Veselovskaya, Vadim Medvedev, Nikolai Gritsenko, Victor Sharlakhov.

Smiley Gets a Gun (20th Century-Fox). Australian film. Producer-director-writer, Anthony Kimmins. With Keith Calvert, Sybil Thorndike, Chips Rafferty, Bruce Archer.

The Tailor's Maid (Trans-Lux). Italian film. Producer, Guido Giambartolomei; director, Mario Monicelli. With Vittorio De Sica, Lorella De Luca, Marcello Mastroianni, Marisa Merlini, Fiorella Mari.

Tempest (Paramount). Italian-French film. Producer, Dino DeLaurentiis; director, Alberto Lattuada; screenplay by Louis Peterson and Alberto Lattuada, based on two stories by Alexander Pushkin, *The Captain's Daughter* and *The Revolt of Pugachov*. With Van Heflin, Viveca Lindfors, Silvana Mangano, Geoffrey Horne, Oscar Homolka, Robert Keith, Agnes Moorehead, Helmut Dantine, Finlay Currie.

Tiger Bay (Continental). English film. Producer, John Hawkesworth; director, J. Lee Thompson. With John Mills, Horst Buchholz, Hayley Mills, Yvonne Mitchell, Megs Jenkins.

Wild Strawberries (Janus). Swedish film. Producer, Allan Ekelund; director-writer, Ingmar Bergman; director of photography, Gunnar Fischer. With Victor Sjostrom, Ingrid Thulin, Gunnar Bjornstrand, Jullan Kindahl, Bibi Andersson, Naima Wifstrand.

The Woman in the Painting (Lopert). Italian film. Producer, Carlo Civallero; director, Franco Rossi. With Andrea Scire, Geronimo Meynier, Luigi Tosi, Carlo Tamberlani.

Yevgeni Onegin (Artkino). Russian film. Producer-director, Roman Tikhomirov; screenplay by Alexander Ivanovsky and Roman Tikhomirov, from the novel by Alexander Pushkin. Film version of the opera by Pyotr Tchaikovsky. With Ariadne Shengelaya, Svetlana Nemolyaeva, Vadim Medvedev, Igor Ozerov, Ivan Petrov.

MOTOR TRANSPORTATION. The year 1959 was expected to be a record year for intercity truck transportation in the United States, but commercial bus volume declined slightly due to an increase in private passenger car use.

Trucking.—The continued climb of trucking was marked by an approximate 15% increase over the $6.2 billion total operating revenues posted by the 18,000 Class I, II, and III motor carriers of property in 1957 and 1958. In addition, billions of dollars worth of service was performed by a large number of private and for-hire carriers not under regulation by the Interstate Commerce Commission (q.v.). Continued tight control over costs and recovery from the recession of 1958 resulted in the best earnings in several years. Reports of Class I and II carriers showed operating ratios (the percentage relationship of expenses to gross revenues) of 95.7 and 93.4, respectively, for the first and second quarters of 1959. The trucking industry as a whole provided employment for more than 7 million persons in 1959.

It is estimated that trucks haul more intercity freight than any other means of transportation—42% of the total tons moved and well over half in terms of total value of service. In addition, trucks haul virtually all goods moving in local service.

Truck registrations kept pace with the general growth of the industry. In 1959, 11 million private and commercial trucks were registered—up 3.5% from the 1958 record.

Higher truck registrations, additional mileage, and the one-cent-a-gallon increase in the federal fuel tax appeared to be raising the amount of federal, state, and local highway user charges paid by the motor carrier industry beyond the $2.5 billion paid in 1958.

Trucking industry spokesmen continued to voice opposition to railroad efforts to obtain congressional authorization to own and operate other forms of transportation without restriction. Congressional consideration was postponed until the 1960 session.

Bus Operations.—The National Association of Motor Bus Operators reported that there were more than 260,000 buses in the United States in 1959. Less than 20,000 were engaged in intercity service, and these accounted for more than 1.1 billion vehicle miles during the year, providing nearly half a billion rides to passengers who traveled an estimated 23.5 billion passenger miles. Intercity buses also carried more express packages than ever before, as well as an increasing amount of mail. Buses provide the only form of public intercity passenger service to an estimated 40,000 communities in the United States.

Local and suburban buses numbered fewer than 60,000 in 1959 but provided more than 5 billion rides. The nation's 150,000 school buses carried about 11 million children to and from their classes at an annual average cost of $36 per pupil.

Employment of companies engaged primarily in providing intercity bus service exceeded 50,000 during 1959, not including the services of many commission agents who sold tickets and provided other services in small communities. Local transit systems employed more than 110,000 persons.

The problem of adequate service, hampered by declining travel volume and rising costs, has been receiving increasing recognition, with the result that some state and federal tax relief has been granted.

MUELLER, Frederick Henry, U.S. secretary of commerce: b. Grand Rapids, Mich., Nov. 22, 1893. He was appointed secretary of commerce by President Eisenhower on July 21, 1959 (sworn in, August 10), after serving as acting secretary following the resignation on June 30 of his controversial predecessor, Lewis Strauss (see UNITED STATES—*The United States in 1959*). Previously, Mueller had been in the Department of Commerce as assistant secretary for domestic affairs (1955–58) and as under secretary (1958–59).

Mueller was graduated from Michigan State College in 1914 with a degree in mechanical engineering. He immediately joined the Mueller Furniture Company (Grand Rapids), which his father had founded. From then until his entry into government service in 1955 he was a general partner in the business. Combined with his business duties was a variety of other professional and civic activities, including the presidency of the National Association of Furniture Manufacturers (1934–35), the presidency of the United Hospital Fund, Inc. (1948–55), and 12 years of service on the governing board of Michigan State College (later University).

In late November 1959 Secretary Mueller led a United States delegation on a 10-day goodwill tour of Poland.

MUNITIONS. See the Index entry, *Weapons.*

MUSCAT AND OMAN. Occupying the southeastern corner of the Arabian Peninsula, the sultanate of Muscat and Oman has an area of 82,000 square miles and a population of about 550,000. The capital is Muscat (est. pop., 5,500), which has a fine

harbor on the Gulf of Oman, but the main market center is Matrah (est. pop., 8,500), three miles to the north.

The state is governed very loosely by Sayyid Sa'id ibn Taymur ibn Faysal, the sultan since 1932. In 1939 and 1951, Muscat and Oman signed treaties of commerce and navigation with Great Britain, confirming the long friendly relationship between the two states and unofficially placing the sultan's foreign affairs in the hands of the British.

The state remains tied to Great Britain commercially, and is a part of the sterling bloc. Indian rupees are the local currency, although Muscat issues small fractional coins. Dates, pomegranates, limes, and fish are the chief exports. The country is underdeveloped and its natural resources are largely unexplored.

In the interior, near Fahud, the Iraq Petroleum Co. continued drilling for oil in 1959. In the province of Dhofar in the southwest, adjacent to Eastern Aden Protectorate, the principal ports are Salalah and Marbat. The Dhofar-Cities Service Petroleum Corp. has discovered oil in this province, and has several producing wells (2,000 barrels a day).

According to the 1920 Treaty of Sib, the central interior of the state, known as Oman Proper or Independent Oman, was to be governed by an elected imam (leader), who would have political and religious authority. In 1954, Ghalib ibn Ali was elected imam of Oman, although the sultan had opposed his election, and late in 1955 sporadic warfare broke out between the sultan and the imam. The British gave aid to the sultan, who had requested their support, while the imam received supplies and encouragement from the Arab states (principally Saudi Arabia). In 1957, Muscat forces, aided by British troops, captured Nazwa in Oman Proper. Fleeing his headquarters, Ghalib ibn Ali, along with his brother Talih and his principal adviser, Sheik Salih ibn Isa al-Harithi, sought refuge among the tribes of Beni Riyam under Sulayman ibn Himyar in the Jebel Akhdar (Green Mountains) of the interior.

Early in 1959, Muscati and British forces so thoroughly routed the imam's supporters in the mountainous areas of Oman that the imam and his close friends crossed over to Dammam in Saudi Arabia and proceeded to Cairo, where exile headquarters were established. British forces were withdrawn from Oman in April 1959. Although Oman leaders and refugee parties were feted in Riyadh by King Saud and honored by Nasser in the United Arab Republic, British relations with these two states so improved in 1959 that the question of Muscat and Oman was not discussed officially by the Arab League Council at its meetings during the year. Ghalib ibn Ali declared that he was the president of the independent republic of Oman, but no Arab state has recognized him.

Professor of History, Ohio State University.

MUSEUMS. See Index entries on specific names of museums.

MUSIC.[1] George Frederick Handel having died in 1759, the year 1959 was marked by bicentennial celebrations everywhere in his honor. Most notably in England, Germany, the United States, and Italy, Handel's oratorios, operas, and instrumental music were very widely revived both in the course of regular concert seasons and, as in New York City, during special Handel festivals. On a smaller scale, Felix Mendelssohn-Bartholdy was honored by special performances during the sesquicentennial of his birth (1809). Similar celebratory performances of music by Frédéric Chopin and Robert Schumann were planned for the 1960 sesquicentennials of their births (1810).

[1] This article deals chiefly with developments related to the concert and operatic stages and to new music. For information on the year's activities in recorded music, see RECORDS, PHONOGRAPH; for music of the legitimate theater and ballet, see THEATER and DANCE, respectively; and for music in television programs, see RADIO AND TELEVISION.)

The violinist Mischa Elman marked the completion of fifty years before the public by giving a concert at Carnegie Hall, in New York City on Dec. 8, 1958. Other anniversaries were signalized by the Worcester (Mass.) Music Festival (100 years); the Battle Creek (Mich.) Symphony Orchestra (60 years); the Wheeling (W.Va.) Symphony Orchestra (30 years); the Glyndebourne (England) Festival Opera (25 years); and the Aspen (Colo.) Music Festival (10 years).

Among individuals who made musical news during the year were, again, Van Cliburn (Harvey Lavan Cliburn, Jr.) and Maria Callas; they appeared as soloists at the 102d anniversary concert of the Philadelphia Academy of Music, on Jan. 24, 1959, before a capacity audience that had paid up to $100 a person for orchestra seats. The renowned Russian mezzo-soprano Zara Doloukhanova made her United States debut at Town Hall, New York City, on March 13, 1959, and filled Carnegie Hall for a second recital ten days later. At the end of the year, on December 18, the musical world was

Birgit Nilsson, Swedish soprano, made her historic Metropolitan Opera debut on Dec. 18, 1959.

ANGEL RECORDS

thrilled by the Metropolitan Opera debut of Swedish soprano Birgit Nilsson in Wagner's *Tristan und Isolde*.

In music's academic news in 1959, it was announced that the violinist Jascha Heifetz had been appointed Regents' professor of music and artist in residence at the University of California, Los Angeles; that the Italian composer Luigi Dallapiccola had been added to the faculty of Queens College in New York City; and that the Italian composer Mario Castelnuovo-Tedesco had become visiting professor at Michigan State University in Lansing.

The young Minneapolis-born baritone Cornell MacNeil, who had been heard with the Cosmopolitan Opera (San Francisco) and the Chicago Lyric Opera in October 1958, made sensational debuts both at La Scala, Milan, and, unexpectedly on March 21, 1959, at the Metropolitan Opera, New York. The noted symphonic and operatic conductor Dimitri Mitropoulos suffered a heart attack on Jan. 22, 1959, during the Metropolitan Opera season, necessitating the division of his assignments among other conductors. The 1959 Queen Elisabeth of Belgium International Music Competition was won by a 17-year-old Bolivian violinist, Jaime Laredo, who later made a successful Carnegie Hall debut on October 19, and was booked to play as soloist with the Philadelphia Orchestra on December 7. After serving for 27 years as chief of the Music Division of the New York Public Library, Carleton Sprague Smith resigned on Feb. 28, 1959; he was succeeded by Philip L. Miller.

On Oct. 22, 1959, a Russian musical delegation consisting of Dmitri Shostakovich, Tikhon Khrenikov, Dmitri Kabalevsky, Konstantin Dankevich, Fikret Amirov, and the critic Boris Yarustovsky arrived in New York for a month's tour of the

UPI

(*Left*) Maria Callas, singing in Kansas City on October 28, meets former President Harry Truman. (*Right*) Conductor Leonard Bernstein (l.) chats with Soviet novelist Boris Pasternak after New York Philharmonic's Moscow concert, September 11.

United States, returning the visit to the USSR made in 1958 by the American composers Roy Harris, Ulysses Kay, Peter Mennin, and Roger Sessions. The German pianist Hans Richter-Haaser made his United States debut with the Cincinnati Symphony Orchestra, playing Robert Schumann's Piano Concerto on Oct. 16, 1959; and 12 days later gave a highly praised recital at New York's Town Hall.

In New York City, the long-discussed Lincoln Center for the Performing Arts moved nearer to realization. Planned to provide permanent homes for the New York Philharmonic Orchestra, the Metropolitan Opera, and related organizations, the center was soliciting funds to total $75 million, its estimated cost. Late in 1958 the Carnegie Corporation of New York granted the center $500,000 "for scholarships and other assistance to young artists in launching their professional careers," and by May 1959 the pledged funds totaled more than 60% of the center's goal. On May 14, 1959, President Eisenhower, taking part in the center's ground-breaking ceremonies, turned the first shovel of dirt; shortly thereafter, work began on Philharmonic Hall, to seat 2,400 people, scheduled to be completed by the summer of 1961.

Other aid to American music during 1959 came from the Ford Foundation. Its grants included $950,000 to the Metropolitan, New York City, Chicago Lyric, and San Francisco opera companies to provide for the production of up to 18 new American operas during the 1960's; $200,000 to provide for 25 "composers in residence" at secondary schools, with no teaching requirements; and $130,000 to enable 10 leading artists to have 10 composers of their choice write works for them.

Orchestras.—The Baltimore Symphony lost its conductor when Massimo Freccia resigned to become director of the Orchestra of the Rome Radio (RAI) as of Dec. 1, 1959; he was succeeded by Peter Herman Adler. Hans Rosbaud made his United States debut conducting the Chicago Symphony on Jan. 2, 1959. Paul Kletzki opened his first season (the orchestra's 58th) as musical director of the Dallas Symphony with a concert on Nov. 17, 1958. The American debut of Eugen Jochum, conductor of the Munich Radio Orchestra, was made with the Los Angeles Philharmonic on Nov. 13, 1958. Sir John Barbirolli, conductor of the Hallé Orchestra of Manchester (England) and onetime conductor of the New York Philharmonic (1937–43), returned to New York for the first time, as a guest conductor, on Jan. 3, 1959. Skitch Henderson, musical director of the National Broadcasting Company, was appointed musical director of the Scranton (Pa.) Philharmonic on June 1, 1959. On December 15, Antal Dorati, director of the Minneapolis Symphony Orchestra for 11 years, announced his resignation effective at the end of the 1959–60 season.

The Israel Philharmonic of Tel Aviv appointed the French conductor Jean Martinon to be its music director for two years beginning in October 1959. The orchestra of the Concerts Lamoureux, Paris (with which Leonard Bernstein had made his Paris debut as guest conductor a short time earlier), had a new chief conductor, Igor Markevitch, under whom it was scheduled to make its first United States tour in 1960. In Vienna and Cologne it was announced that Wolfgang Sawallisch, present musical director at Wiesbaden, Germany, would also become general music director of the Cologne Opera and chief conductor of the Vienna Symphony on Sept. 1, 1960.

Foreign tours by American orchestras continued in 1959. The Little Orchestra Society of New York (Thomas Scherman, conductor) under the auspices of President Eisenhower's Special International Program for Cultural Presentations, as administered by the American National Theatre and Academy (ANTA), played 38 concerts in 20 cities in India, Ceylon, Thailand, South Vietnam, Hong Kong, Taiwan, Korea, and Japan in the spring of 1959. Under the same auspices, and with Leonard Bernstein and Thomas Schippers as joint conductors, the New York Philharmonic was heard in some 50 concerts in Greece, Lebanon, Turkey, Austria, Poland, the USSR, Netherlands, Germany, Luxembourg, France, Switzerland, Yugoslavia,

Visiting the U.S., Tikhon Khrenikov (l.), secretary of the Union of Soviet Composers; Boris Yarustovsky (center), professor at the Moscow Conservatory; and composer Dmitri Shostakovich (r.) take part in a radio program on November 23.

N.B.C.

Italy, Norway, Finland, Sweden, and England in the late summer and early fall of 1959. The National Symphony of Washington, D.C., under the same auspices, toured Central and South America during the summer of 1959 under the direction of Howard Mitchell, visiting 19 countries in 12 weeks.

Musical America's annual survey of the repertoires of United States symphony orchestras showed (June 1959) that 35 orchestras had, in their subscription seasons of 1958–59, played 903 different works at 3,666 performances. Of the 257 composers represented, 113 were classified as "foreign, standard," 73 as "American," and 71 as "contemporary foreign." Beethoven, Mozart, Brahms, J. S. Bach, Wagner, Tchaikovsky, and Ravel led the first category in number of performances; Copland, Creston, Gershwin, Barber, Riegger, and Harris led the second; and Stravinsky, Walton, Shostakovich, Hindemith, Britten, and Kodály led the third.

Opera.—The 1958–59 season at New York's Metropolitan Opera opened on Oct. 27, 1958, with a performance of Puccini's *Tosca;* Dimitri Mitropoulos conducted, and the cast included Renata Tebaldi, Mario Del Monaco, and George London. The company gave 238 performances, 63 of them outside of New York City, and ended the season, during which attendance was at 97.2% of capacity, with its lowest operating deficit ($528,873) of recent years. *Tosca,* Musorgski's *Boris Godunov,* and Puccini's *La Bohème* were sung most often. Highlights of the season were first Metropolitan stagings of Verdi's *Macbeth* and Alban Berg's *Wozzeck.* Verdi (43 singings of 7 operas) and Puccini (44 of 4, during the centennial of his birth) were heard most. On March 2, 1959, the Metropolitan presented for the first time a complete evening of ballet by its own dancers.

The 1959–60 season, marking the company's 75th anniversary and scheduled to be the longest in Metropolitan history (25 weeks), opened on Oct. 26, 1959, with a new staging of Verdi's *Il Trovatore,* presenting Giulietta Simionato in her belated Metropolitan debut, Antonietta Stella, Carlo Bergonzi, and Leonard Warren. Birgit Nilsson, after her stunning debut on December 18 as Isolde, followed with a dramatic repeat performance on December 29 in which she sang to a relay of three Tristans. Each of the company's three tenors for this part being indisposed and incapable of doing the entire opera, Miss Nilsson sang to the Tristan of Ramon Vinay in Act I, Karl Liebl in Act II, and Albert Da Costa in Act III. Other new productions scheduled for the season included Mozart's *Le Nozze di Figaro,* Verdi's *Simon Boccanegra,* Beethoven's *Fidelio,* and Johann Strauss, Jr.'s *The Gypsy Baron,* the last in a new English translation, and with Broadway's Walter Slezak (son of the renowned operatic tenor Leo Slezak) in a leading role. Martha Moedl, Jussi Bjoerling, and Ettore Bastianini were scheduled to return to the Metropolitan after brief absences; announced as added to the roster were sopranos Anna Moffo, Maria Luisa Nache, Birgit Nilsson, Elisabeth Soederstroem, and Teresa Stratas; mezzo-sopranos Christa Ludwig, Giulietta Simionato, and Joan Wall; tenor Jon Vickers; baritones Cornell MacNeil and Roald Reitan; bass-baritone Kim Borg; and basso-buffo Oskar Czerwenka. In October 1959 it was announced that the American dramatic soprano Eileen Farrell would at last join the Metropolitan company, to sing the title role in Gluck's *Alceste* during the 1960–61 season.

The New York City Opera Company, assisted by a further grant from the Ford Foundation, gave 12 American operas and musical comedies during the spring of 1959 at the City Center: Gian-Carlo Menotti's *Maria Golovin* and *The Medium;* Kurt Weill's *Street Scene;* Douglas Moore's *The Ballad of Baby Doe* and *The Devil and Daniel Webster;* Lee Hoiby's *The Scarf;* Carlisle Floyd's *Wuthering Heights* and *Susannah;* Robert Ward's *He Who Gets Slapped;* Norman Dello Joio's *The Triumph of St. Joan;* Marc Blitzstein's *Regina;* and Hugo Weisgall's *Six Characters in Search of an Author.* Returning to international opera in the fall, the company opened its season on Sept. 24, 1959, with Leopold Stokowski conducting a double bill of Stravinsky's *Oedipus Rex* and Carl Orff's *Carmina Burana.* Its performance of Mozart's *Così fan tutte* in English translation, first heard on October 8, was greatly praised.

The Chicago Lyric Opera opened its 1959 fall season on October 12 with *Carmen;* other operas billed for the seven-week season were Rossini's *La Cenerentola;* Verdi's *Simon Boccanegra* and *Un Ballo in Maschera;* Puccini's *Turandot;* Janáček's *Jenufa;* Mozart's *Così fan tutte;* Ponchielli's *La Gioconda;* and Massenet's *Thaïs.* Leading singers announced included Jean Madeira, Margherita Roberti, Gré Brouwenstijn, Birgit Nilsson, Elisabeth Schwarzkopf, Eileen Farrell, and Leontyne Price; Giuseppe di Stefano, Fernando Corena, Richard Tucker, Tito Gobbi, Leopold Simoneau, and Giuseppe Taddei.

In San Francisco on Sept. 18, 1959, Richard Strauss' complex *Die Frau ohne Schatten* was given its first United States staging by the San Francisco Opera. The company's repertoire also listed Bizet's *Carmen;* Montemezzi's *L'Amore dei Tre Re;* Wagner's *Die Meistersinger;* Verdi's *Aïda* and *Otello;* Puccini's *Madama Butterfly* (in which Sena Jurinac made her United States debut on September 22) and *La Bohème;* Giordano's *Andrea Chénier;* Donizetti's *Lucia di Lammermoor;* Richard Strauss' *Ariadne auf Naxos;* Mozart's *Don Giovanni;* Leoncavallo's *I Pagliacci;* and Carl Orff's *Carmina Burana.*

The Dallas Civic Opera presented Maria Callas in Donizetti's *Lucia di Lammermoor* on Nov. 6 and 9, 1959, and in Cherubini's *Medea* on November 19 and 21. (Miss Callas had given her first recital of the 1959–60 season in the United States at Kansas City, Mo., on October 28.)

In Paris, a much-needed reform of the two state-subsidized opera houses seemed to have begun under the hand of their new administrator, A. M. Julien, the aim in part being to present standard works at the Opéra, more modern works at the Opéra-Comique.

Summer Music and Festivals.—The now-familiar music festivals, summer concert series, and special opera seasons were held at Ann Arbor (Mich.), Aspen (Colo.), Tanglewood (Lenox, Mass.), Bethlehem (Pa.), Grant Park and Ravinia (Chicago, Ill.), Cincinnati (Ohio), Hollywood Bowl (Los Angeles, Calif.), Lewisohn Stadium (New York City, with a total attendance of 198,000 at 24 concerts), Ojai (Calif.), Redlands (Calif., with a total attendance of 80,300), Fish Creek (Wis.), Robin Hood Dell (Philadelphia, Pa.), Vancouver (British Columbia), Worcester (Mass.), and elsewhere in North America. Notable events in these categories were also held at Baalbek (Lebanon), Bergen (Norway), Bayreuth (Germany), Copenhagen (Denmark), Edinburgh (Scotland), Glyndebourne (England), at several cities in Holland, and at Osaka (Japan), San Juan (Puerto Rico), Prades (France), Salzburg (Austria), and Spoleto (Italy). A new festival was announced for London in September and October 1960.

New Music.—Much-discussed new compositions

heard for the first time during the 1958–59 season included Pierre Boulez' *Deux improvisations sur Mallarmé,* heard at the first concert in the hall of the new UNESCO Headquarters building in Paris; Lukas Foss' *Symphony of Chorales;* Leoš Janáček's 1904 opera *Osud* (*Fate*); Rolf Liebermann's *Capriccio* for Soprano, Violin, and Orchestra; Bohuslav Martinů's *Estampes* and *The Parables;* Francis Poulenc's one-act, one-character operatic setting of Jean Cocteau's play *La voix humaine,* to be heard in New York for the first time under the auspices of the American Opera Society on Feb. 23, 1960; Wallingford Riegger's Variations for Violin and Orchestra; Bernard Rogers' two-movement symphony entitled *Africa;* Harald Saeverud's *Minnesota Symphony;* and Dmitri Shostakovich's first operetta, *Moscow Cheremushki.* Also new were Aaron Copland's orchestra-accompanied second set of *Old American Songs;* Paul Hindemith's *Pittsburgh Symphony;* Darius Milhaud's *Tristesses;* Ned Rorem's Symphony No. 3; William Russo's Symphony No. 2, subtitled *Titans;* Alexander Tcherepnin's Symphony No. 4; and Virgil Thomson's score for the United Nations Film Board's *Power Among Men.*

Heard in the United States for the first time were Paul Ben-Haim's *The Sweet Psalmist of Israel;* Alban Berg's *Altenburg Lieder;* Benjamin Britten's *Nocturnes* for Tenor and Small Orchestra and miracle play for children, *Noye's Fludde;* Carlos Chávez' extended piano piece, *Invención;* Karl Hartmann's Symphony No. 6; Paul Hindemith's *Octette* and *Six Madrigals on Texts by Joseph Weinheber;* Alan Hovhaness' *Magnificat,* opus 157; André Jolivet's *Symphonie de Danses;* Rolf Liebermann's *Symphony 1949;* Richard Strauss' opera *Die Frau ohne Schatten;* Igor Stravinsky's *Threni, id est Lamentationes Jeremiae Prophetae;* and Hugo Wolf's opera *Der Corregidor.* The world première of Stravinsky's *Movement* for Piano and Orchestra was scheduled for a December–January series of New York concerts during which Stravinsky has invited four American composers (Barber, Copland, Foss, Sessions) to play the piano parts in a performance of his *Les Noces* to be conducted by him.

Jazz.—Jazz festivals continued to gain in popularity during 1959. The Newport Jazz Festival sponsored related activities in French Lick (Ind.), Boston, and Toronto. New York City heard a festival on Randalls Island; the annual event at Monterey (Calif.) was repeated. *Playboy* magazine sponsored a three-day Chicago festival that broke attendance records. The Newport Festival also sponsored tours by jazz groups, one through the United States, another—with Dave Brubeck, Buck Clayton, and Dizzy Gillespie—to Europe.

Foreign tours of American jazz groups became so numerous that 1959 was referred to as "the year that everybody went everywhere." One event of special interest was an informal jam session given in the USSR by Dwike Mitchell and Willie Ruff of the traveling Yale Choral Group. Despite previous Soviet hostility to jazz, the session was officially sanctioned for public attendance and aroused highly favorable reactions.

Jazz reached film soundtracks in unprecedented quantity both in the United States and in Europe. John Lewis and the Modern Jazz Quartet and Art Blakey and his Jazz Messengers furnished the tracks for films on both sides of the Atlantic, and Lewis composed incidental music for the film *Odds Against Tomorrow.* Duke Ellington and his orchestra played the track for the popular *Anatomy of a Murder.*

Necrology, 1959.—Notable figures in the musical world who died during the year included the conductor F. Charles Adler (Feb. 16); the composer George Antheil (Feb. 12); the composer Ernest Bloch (q.v., July 15); the English musicologist Eric Blom (April 11); the Austrian atonal composer and theorist Josef Matthias Hauer (Sept. 22); the tenor and former general manager of the Metropolitan Opera, Edward Johnson (April 20); the Finnish song composer Yrjö Kilpinen (March 2); the harpsichordist Wanda Landowska (q.v., Aug. 16); the Italian tenor Mario Lanza (Oct. 7); the Czech composer Bohuslav Martinů (Aug. 28); the English critic and biographer of Wagner, Ernest Newman (pseudonym of William Roberts, July 7); the musicologist Curt Sachs (Feb. 5); the composer Lazare Saminsky (June 30); the composer Lamar E. Stringfield (Jan. 21); the conductor Eduard Van Beinum (April 13); the composer Heitor Villa-Lobos (q.v., Nov. 17); and David Mannes, conductor and co-founder of New York City's Mannes College of Music (April 24).

There were also several important deaths in the jazz world during the year: Omer Simeon (Sept. 17), whose playing with Jelly Roll Morton and Earl Hines is historic; Sidney Bechet (May 14), whose career had reached its climax in recent years in France; Lester "Prez" Young (March 15), an initiator of the "cool" style of the 1940's; and Billy "Lady Day" Holiday (July 17), a model for many of today's jazz singers in ballads and blues.

MUTUAL SECURITY PROGRAM. See FOREIGN AID PROGRAMS, U.S.

NARCOTICS. International control measures discussed at the 14th session of the United Nations Commission on Narcotic Drugs at Geneva, Switzerland, April 27 to May 15, 1959, included the following four recommendations:

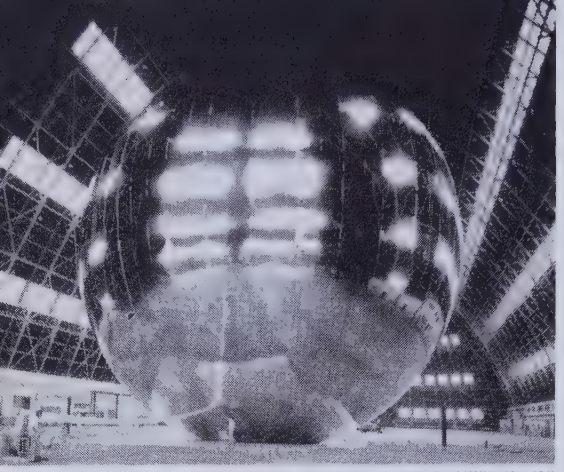
(1) That all governments which have not yet done so adhere to the Protocol of 1948, and that governments of opium-producing countries adhere to the International Opium Protocol of 1953 as soon as possible.

(2) That governments exercise prompt provisional control of narcotic drugs having powerful analgesic or antitussive properties, pending World Health Organization findings regarding their addiction-producing liabilities.

(3) That the World Health Organization prepare a report on the use of cannabis for extraction of useful drugs as a basis for permitting extraction of those drugs under the Single Convention on Narcotic Drugs.

(4) That the United Nations secretary-general, in cooperation with the International Civil Aviation Organization, World Health Organization, and International Criminal Police Organization, prepare essential standards for control of narcotic drugs in first-aid kits on board aircraft engaged in international flight.

Illicit International Traffic.—Morphine and heroin were the most common drugs in illicit traffic in 1959. The United States was the chief recipient of illicit heroin, and Iran was the main target of traffic in opium. Cannabis traffic, present throughout



NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

Space balloon developed by NASA for use as a communications satellite was test-fired from Virginia to height of 250 miles on Oct. 28, 1959, and Jan. 16, 1960. The 100-foot aluminum-coated plastic sphere is designed to permit visual tracking while in orbit and to reflect radio and radar signals over wide areas of the earth. Radio signals were successfully bounced off the sphere in the January test. The balloon, sent aloft by a rocket booster, is inflated in space.

the world, was heaviest in the United States, Mexico, Brazil, Morocco, and several other parts of South Africa, the Far East, and the Middle East. Considerable cocaine traffic existed in several South American countries, with indications of persistent use of cocaine in other parts of the world.

Opium.—The largest seizures of raw and prepared opium were made in the Far and Middle East, chiefly in Burma-China-Thailand border areas of illicit cultivation, including Laos and South Korea.

Morphine and Heroin.—Traffic in crude morphine from illicit sources near northern Thailand through Bangkok to Hong Kong, Malaya, and Macao was reported, with much clandestine manufacture of heroin in Hong Kong and Macao. Japan, South Korea, and Taiwan reported traffic in opiates from Hong Kong. The United States seized much heroin smuggled from Hong Kong and Japan. Clandestine manufacture and smuggling of morphine and heroin from the Far and Middle East continued to other parts of the world.

Cocaine.—The U.N. Commission on Narcotic Drugs requested the secretary-general to report on the cocaine discussion at the commission's 14th session to the governments of several South American countries, urging full cooperation of all countries to reduce this traffic. Heavy transit traffic continued through Cuba to the United States. Governments were asked to abolish the dangerous habit of coca chewing.

Cannabis.—Traffic much the same as in 1957 occurred largely in the Far East, Africa, and Central and South America. Vigorous enforcement measures in several countries resulted in large seizures. Mexico and the United States cooperated closely to check illicit traffic.

Khat.—Information received from Aden, Ethiopia, Israel, Saudi Arabia, and Yemen on medical and social problems involved in the use of khat was reviewed. Action was deferred pending completion of a report by the World Health Organization.

Barbiturates and Tranquilizers.—National control of these drugs was advised. If international control should become necessary, they could be included in the Single Convention on Narcotic Drugs.

Addiction.—Heroin addiction continued in many areas, particularly in Hong Kong, Japan, the United States, and Canada. Greece reported decreased addiction to heroin, but increased abuse of cannabis. Iran, through vigorous enforcement, reduced the number of opium addicts by two thirds. Much opium addiction exists in the Far and Middle East, but its extent is unknown because of incomplete reporting from some areas.

Addiction in the medical profession caused concern. More thorough education of medical students on the dangers of addiction was considered necessary to insure adequate precautions in medical practice.

United States.—Continued rigid enforcement of the minimum mandatory penalties for unlawful sale of narcotic drugs provided by the Narcotic Control Act of 1956, where supported by adequate state laws, has materially reduced illicit traffic and addiction. On Dec. 31, 1958, a total of 46,266 addicts was reported in the United States, of whom 20,595 were in New York, 6,323 in Illinois, and 6,214 in California. New York and California lack strong penalty laws, but Illinois enacted a law in 1957 which provides a 10-year minimum mandatory prison sentence for unlawful sale of narcotic drugs, with effective enforcement under the newly established Division of Narcotic Control.

NATIONAL ACADEMIES AND ASSOCIATIONS. For private organizations whose titles begin with the word National (excepting National Geographic Society, which is reviewed below), see the article Societies and Organizations.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION. The close of the first operating year of the National Aeronautics and Space Administration (NASA) was marked on Sept. 30, 1959. NASA, formally created on July 29, 1958, has responsibility for the civilian-oriented astronautical and space program of the United States.

Project Mercury.—A notable development during the year was Project Mercury. Scientific objectives of Project Mercury are: (1) to place a manned capsule in orbital flight around the earth; (2) to investigate man's reaction to and capabilities in this environment; and (3) to recover the capsule and astronaut safely.

Selection and training of the human occupant of the capsule, and the development of a spaceworthy capsule, are of equal importance. Therefore, NASA established a Special Advisory Committee on Life Sciences, which gave advice on the human aspects of Project Mercury and made suggestions on human engineering and equipment design. The committee also established the qualifications and attributes required of the pioneer United States astronauts. To qualify, candidates were required: (1) to have a degree or equivalent in physical sciences or engineering; (2) to be a graduate of a military test-pilot school; (3) to have at least 1,500 hours flying time, including a substantial amount in high performance jets; (4) to be younger than 40; (5) to be no taller than 5 feet 11 inches; (6) to be in superb physical condition; and (7) to possess psychological attributes specified by the Life Sciences Committee.

In January 1959, NASA screened the records of 473 Air Force, Navy, and Marine Corps officers, selecting 110 of them as potential candidates. The candidates were brought to NASA headquarters in Washington for preliminary briefing and personal interviews. Of those interviewed in February, 63 met basic requirements. On the basis of technical

and psychiatric interviews and psychological and aptitude tests, the number of candidates was narrowed to 32, who were given intensive physical examinations and subjected to stress, heat, cold, altitude, and other tests. On April 9, names of the seven astronauts, one of whom will be the first American in space, were announced.[1]

Assigned to NASA by their military services, the astronauts took up their duties with the Space Task Group at Langley Research Center, Hampton, Va. Their intensive training program includes lectures in basic astronautics, Mercury systems, and high-altitude physiology plus experiences in withstanding weightlessness and high-gravity forces. For example, taken aloft in a C-131 transport, the astronauts have undergone the weightlessness of zero gravity for as long as 15 seconds. At the Naval Air Development Laboratory, Johnsville, Pa., the astronauts practiced take-off, orbital flight, and landing in a centrifuge chamber rotated at great speeds—the acceleration on the pilot mounting at times to 16 g. (16 times the pull of gravity).

On Jan. 12, 1959, NASA selected the McDonnell Aircraft Corp., St. Louis, Mo., to design, develop, and build the Mercury capsule. NASA's Space Task Group is engaged in various developmental programs involving capsule models and mock-ups. These programs include: air-drop tests, escape-system studies, free-flight and wind-tunnel investigations, impact tests, parachute tests, and tests of the life-support system.

On May 28, 1959, an Army Jupiter IRBM carrying two live monkeys as part of a biological payload in its nose cone was launched from the Atlantic Missile Range, Cape Canaveral, Fla. After a 15-minute flight during which it reached a 360-mile altitude and speeds up to 10,000 miles per hour, the nose cone and its passengers landed in the South Atlantic, 40 miles north of Antigua. A Navy tug recovered the nose cone.

Chief purposes of the experiment were to recover the nose cone and obtain physiological and psychophysiological data on animals of primate level subjected to space flight conditions. Subjects of the medical phase of the experiment were Able, a seven-pound rhesus monkey, and Baker, a one-pound squirrel monkey. Able died four days later while undergoing general anesthesia for removal of implanted electrodes. An autopsy indicated that death was in no way attributable to the space flight. Medical portions of this experiment were carried out by the Army with the cooperation of the Air Force and Navy.[2]

On Sept. 9, 1959, an Atlas bearing a full-scale developmental "boilerplate" version of the Mercury capsule was fired 100 miles above the earth downrange from Cape Canaveral. Purpose of the launching was to test re-entry capabilities, chiefly performance of the heat shield, flight characteristics of the capsule and its instruments, and capsule recovery. After having withstood very severe re-entry conditions, the capsule was retrieved by a Navy destroyer in the Atlantic north of Puerto Rico. The ablation heat shield had successfully survived the fierce heat of re-entry. The capsule also proved stable, and its instruments operated properly.

[1] The seven astronauts are: Navy Lt. Malcolm S. Carpenter (33), Garden Grove, Calif.; Air Force Capt. Leroy G. Cooper (32), Carbondale, Colo.; Marine Lt. Col. John H. Glenn, Jr. (37), New Concord, Ohio; Air Force Capt. Virgil I. Grissom (33), Mitchell, Ind.; Navy Lt. Comdr. Walter M. Schirra, Jr. (36), Hackensack, N.J.; Navy Lt. Comdr. Alan B. Shepard, Jr. (35), East Derry, N.H.; and Air Force Capt. Donald K. Slayton (35), Sparta, Wis.

[2] The experiment is continuing, with Baker, the surviving monkey, still under observation.

UPI

Model of the Project Mercury capsule which will carry first American into orbit is positioned in wind tunnel of NASA's research center, Langley Field, Va., for tests to determine its lift, drag, and static stability characteristics in flight.

Successful launchings in the "Little Joe" test series were conducted in late 1959. Purpose of the "Little Joe" is to test Mercury flight characteristics, re-entry, capsule recovery, escape systems, the capsule-booster combination, and behavior of primates during flight. The booster and launching system were successfully tested on October 4. The booster and capsule model were launched on November 4, and a firing on December 4 tested the Mercury escape system at high altitude, recovery

As part of the Project Mercury man-in-space program, a model of the capsule in which first astronaut will ride is prepared for test launching on October 4 with a "Little Joe" booster rocket at Wallops Island, Va. Atop the capsule is an escape rocket system which will parachute the capsule safely back to earth if trouble develops during launching.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

system, and biological response to space flight of a monkey named Sam, an American-born rhesus, which was recovered alive and well from the capsule in which it rode.

Western Electric Company, Inc., was selected to construct the worldwide tracking and communications network for Project Mercury. This network, using both radar and telemetry, will track the earth-orbiting capsule and monitor its equipment. It will make possible almost continuous communication with the Mercury pilot. Late in 1959, negotiations were under way to acquire sites for Project Mercury tracking stations in several countries in the projected path of the Mercury capsule.

Other Activities.—Between Oct. 11, 1958, and Oct. 13, 1959, NASA successfully launched four earth satellites and three space probes to conduct further investigations of the space environment.

Pioneer I, a probe launched Oct. 11, 1958, gave first information on oscillations in magnetic fields of the earth and interplanetary space, determined the radial extent of the zone of radiation surrounding the earth, and measured density of micrometeors in space.

Pioneer III, a probe launched Dec. 6, 1958, discovered that the radiation zone was composed of at least two bands (the Van Allen belts).

Vanguard II, a satellite launched Feb. 17, 1959, proved the feasibility of the weather satellite concept.

Pioneer IV, a probe launched March 3, 1959, which went into permanent orbit around the sun, provided NASA scientists with an advanced tracking exercise and transmitted excellent radiation data.

Explorer VI, a satellite launched Aug. 7, 1959, indicated that the Van Allen belts may consist of many layers.

Vanguard III, a satellite launched Sept. 18, 1959, contained instruments to measure the earth's magnetic field and X-ray emissions from the sun.

Explorer VII, a satellite launched Oct. 13, 1959, contained instruments to transmit information on radiation balance, Lyman-alpha X-rays, heavy primary cosmic rays, micrometeor density, cosmic rays, temperature, and effects on exposed solar cells.

NASA also fired numerous sounding rockets during its first year to test winds and radiation in the upper atmosphere, including five sodium flare experiments, two of which were successful.

On Oct. 28, 1959, NASA launched a 100-foot diameter inflatable sphere of aluminized Mylar plastic from the Wallops Space Flight Station at Wallops Island, Va. The 130-pound sphere, inflated 250 miles above the Atlantic, was visible for hundreds of miles. Purpose of the launching was to test the feasibility of a communications satellite.

The rocket-powered X-15 research airplane, which is being tested at NASA's Flight Research Center, Edwards Air Force Base, Calif. completed its first captive flight on March 10, 1959, its first glide flight on June 8, and its first powered flight on September 17. On November 5, during another power test, the fuel in the tail section exploded. Pilot Scott Crossfield brought the experimental aircraft safely to earth, however.

The X-15 project has three principal objectives: (1) determining the intensity and effect of aerodynamic heating; (2) obtaining stability and control data in the very thin air of the upper atmosphere; and (3) observing the effects of weightlessness on the pilot. A final engine for the X-15 was ground-tested Sept. 1, 1959 at the Flight Research Center. The new engine, known as the XLR-99, burns a liquid-oxygen liquid-ammonia propellant and has quadruple the thrust of the interim engines used in the X-15.[3]

NASA research centers currently are engaged also in research and development work on ground-cushion vehicles, vertical takeoff and landing (VTOL) and short takeoff and landing (STOL) aircraft, supersonic high-altitude transport aircraft, and the B-70 chemical-fueled bomber. NASA centers are concentrating on such aeronautical research as gas dynamics, combustion, high-impulse fuels, high-temperature and high-stress materials, and strong lightweight fuselages.

Looking toward the future of space exploration, NASA has embarked upon a program of developing progressively more powerful boosters. The vehicles, in order, are called Scout, Delta, Agena, Centaur, and Saturn.[4] The Scout, with anticipated capability for placing a 150-pound payload into orbit, is due to be fired in 1960.

Other promising projects include the development of a nickel-base high-temperature alloy; research concerning an ion rocket engine; and development of a 1.5 million-pound-thrust single-chamber rocket engine.

The new alloy has shown greater strength and impact resistance at 1800° and 1900° Fahrenheit than any other oxidation-resistant alloys currently available. The alloy is suitable for turbine blades and, possibly, for chemical rockets.

It is believed that once other boosters have enabled a vehicle to reach deep space, an ion rocket engine will provide certain advantages of long-life operation for missions into the far reaches of space. On July 9, 1959, the Lewis Research Center operated a research model of an ion rocket.

On Dec. 12, 1958, NASA selected the Rocketdyne Division of North American Aviation, Inc., to develop a 1.5 million-pound-thrust single-chamber rocket engine. The development contract, signed Jan. 19, 1959, involved total costs of $102 million over a period of three to four years. According to the development schedule, preliminary flight-rating tests should be completed in about 46 months from the date of contract. The program will provide a booster of great size that will be used to launch payloads weighing several tons. Full advantage was taken of an Air Force study of the project's feasibility. Cooperative arrangements were worked out with the Air Force for engine test stands at Edwards Air Force Base.

(The foregoing article was furnished by the National Aeronautics and Space Administration.)

NATIONAL ARCHIVES AND RECORDS SERVICE. This branch of the General Services Administration includes the National Archives, the Office of Records Management, the Office of the Federal Register, the Franklin D. Roosevelt Library at Hyde Park, N.Y., and the Harry S Truman Library at Independence, Mo. The service is headed by the archivist of the United States, who also serves as chairman of the National Historical Publications Commission.

Responsibilities of the service include promoting improved current records management and paperwork practices of federal agencies; preserving and making available for use by the government and the public the permanently valuable noncurrent records of the federal government; publishing the laws, constitutional amendments, presidential documents, and administrative regulations having general applicability and legal effect; and preserving, publishing, and administering the papers and other historical materials in the presidential libraries.

The parchment originals of the Declaration of

[3] The X-15 research airplane is a joint Air Force-Navy-NASA project. The Air Force and Navy furnish most of the funds for the project, while NASA provides technical direction. North American Aviation, Inc., is the contractor.

[4] In October 1959, an executive order of the president transferred the Development Operations Division of the Army Ballistic Missile Agency, Huntsville, Ala., and the division's Saturn project to NASA, subject to congressional approval. NASA's Vega project was cancelled on Dec. 11, 1959.

Independence, the Constitution of the United States, and the Bill of Rights are on permanent exhibit in the National Archives. Facsimiles of these documents, suitable for display in schools and offices, are now available to the public.

There are more than 900,000 cubic feet of records in the National Archives. Dating from the American Revolution through World War II, these records include some 35,000 sound recordings, 1,150,000 maps and charts, 3,000,000 still pictures, and 40,000 reels of motion picture film. More than 500,000 reference requests are handled annually.

To help federal agencies reduce the number and improve the quality of their records, the National Archives and Records Service is promoting government-wide workshops on the techniques of correspondence and forms management. The most popular of these, the "plain letters" workshop, was attended by some 84,000 government officials and employees between 1957, the year of its inception, and 1959.

The General Services Administration operates 15 federal records centers, in 10 regions, plus a specialized personnel records center in St. Louis and an annex in Hawaii. The holdings of these centers occupy 5,134,000 cubic feet, and consist chiefly of records not yet ready for disposal or for transfer to the National Archives for permanent preservation.

The Harry S Truman Library is now in full operation, with about 1.5 million papers available for research.

Volumes in the series entitled *Public Papers of the Presidents of the United States*, begun in 1957, are available for the years 1956 and 1958.

WAYNE C. GROVER,
Archivist of the United States.

NATIONAL BUDGET. See TREASURY DEPARTMENT.

NATIONAL BUREAU OF STANDARDS. Established by an act of Congress in 1901, the National Bureau of Standards serves the federal government as a scientific laboratory and provides basic standards of physical measurement for science and industry. In carrying out these related functions, it conducts research, development, calibration, and testing programs in physics, mathematics, chemistry, and engineering.

At the close of 1959 the total staff numbered approximately 3,500 persons, most of whom were stationed at the bureau's principal laboratories in Washington, D.C., and Boulder, Colo. The bureau also maintained 19 field stations in the United States and abroad.

Standards of Measurement.—In 1959, precise interferometric measurements on nine lines of the helium spectrum led to an independent confirmation of the Rydberg constant, which since 1952 has been based on the work of a single set of observers. Three devices were developed which provide very precise standards of length based on the wavelength of radiation from mercury atoms. A technique was worked out for measuring ball bearings used in high-speed gyroscopes for guided missiles to an accuracy of about 5 millionths of an inch.

In continuing research on atomic standards of frequency and time, a precision of 2 parts in 10 billion was achieved with an atomic clock using a beam of cesium atoms. Two rubidium-vapor atomic clocks were under construction.

Marked progress was made in devising apparatus for measuring the properties of materials at very high temperatures. For example, the range over which optical pyrometers can be calibrated was extended from 2,400° to 3,800°C.; a high-current arc capable of producing controlled temperatures was constructed as a temperature source; and a special type of high-temperature resistance thermometer was designed for interpolating between fixed points on the international temperature scale.

Apparatus was devised for special measurements of the heat conductivity of explosives and solid propellants for rockets. An improved method was developed for the precise measurement of shock-wave properties, important in the design of missiles and high-speed aircraft. For the calibration of instruments used to measure high transient pressures, apparatus was devised that generates pressure in steps of accurately known amplitudes up to 50,000 pounds per square inch.

On July 1, 1959, the bureau began making all its calibrations of length and mass (except those for the U.S. Coast and Geodetic Survey and those expressed in metric units) in terms of the International Yard and the International Pound. To secure identical values for the yard and pound in precise measurements, these international units were adopted by agreement between the directors of the national standards laboratories of six English-speaking nations: Canada, New Zealand, United States, United Kingdom, South Africa, and Australia. According to the agreement, the international yard equals 0.9144 meter and the international pound equals 0.45359237 kilogram.

Properties of Materials.—Much of the work on materials was directed toward the accumulation of basic data on their general properties, constants, structure, and behavior at very high temperatures. Because of the increasing need for such data in aircraft and missile development, special efforts were made in 1959 to extend these investigations into higher temperatures. Extensive studies were made of the solid-state reactions that occur in alloys of chromium, iron, nickel, and molybdenum.

For the Wright Air Development Center, a fundamental investigation was conducted to clarify the mechanisms of the processes used to apply refractory oxide coatings to missiles and rockets. Another program undertaken for the center was to obtain high-temperature thermodynamic data on the light elements—lithium, magnesium, aluminum, and beryllium—and their compounds. For use in high-temperature strain gauges, a cement composition was developed which has higher electrical resistivity in the range from 425° to 1,000°C. than any such material now available. As part of a program to determine the strength of ceramics at elevated temperatures, the elastic constants of aluminum oxide single crystals (sapphire) were determined to high precision.

Basic research during 1959 provided information on the reaction mechanisms involved in the degradation of synthetic resins and collagen (the parent substance of leather) when exposed to high temperatures or to nuclear radiation. Evacuated laminates were developed that give greatly improved insulation at very low temperatures. In an investigation of the behavior of solids under pressure, spectroscopic evidence was found which showed changes in molecular structures under pressures of 30,000 atmospheres.

Radio Propagation.—An active program in radio propagation research was carried on by the Central Radio Propagation Laboratory at Boulder. Through application of special radar scatter techniques, a promising method was developed for studying the physics of the upper reaches of the ionosphere. The method permits studies of ionization at levels of the atmosphere well above the reflecting layers reached by conventional sounding techniques and into the region now associated with satellite explo-

ration. Further improvements were made in methods for predicting the tropospheric bending of radio waves in terms of the radio refractive index at the surface of the earth.

Under the sponsorship of the Air Force's Air Research and Development Command, the laboratory completed a three-year investigation to determine the feasibility of a long-distance radio communication system based on reflections from meteor trails. The results indicate that communication by this means can compete effectively with other long-distance systems, and that it is relatively free from ionospheric disturbances. (See also ATMOSPHERE RESEARCH.)

Data Processing.—A Research Information Center and Advisory Service on Information Processing, to be operated jointly by the National Bureau of Standards and the National Science Foundation, was established at the bureau. The new service is designed to bring together research and development data on methods and equipment for the automatic processing of scientific information.

A study was made of the logical problems arising when several high-speed electronic computers are connected together to work on a common large-scale task. The use of an existing computer to work out the design details for a new and more advanced computer was successfully demonstrated. In a study conducted for the Veterans Administration, a method was developed for using a high-speed electronic computer to analyze data on human heartbeats.

Publications.—Results of the bureau's work are available through three periodicals (*Journal of Research, Technical News Bulletin,* and *Basic Radio Propagation Predictions*) and a series of nonperiodical publications. From July 1, 1959, the bureau published its *Journal of Research* in four separate sections (corresponding to subject matter), which may be subscribed for individually. An indexed list of publications (*Publications of the National Bureau of Standards,* Circular 460 and Supplement, $2.75) is available from the Superintendent of Documents, U.S. Government Printing Office, Washington 25, D.C.

NATIONAL FORESTS. See FORESTRY.

NATIONAL GEOGRAPHIC SOCIETY. This society, organized in January 1888 "for the increase and diffusion of geographic knowledge," numbered 2,400,000 members at the end of 1959. From its headquarters at 16th and M Streets, N.W., Washington 6, D.C., it continued in 1959 to send its staff writers and photographers to all parts of the world to gather material for its monthly illustrated *National Geographic Magazine.* Through its Committee for Research and Exploration it sponsored a wide range of expeditions and other scientific projects.

Research, 1959.—A survey crew, two field excavation teams, and a laboratory staff comprised the force of the National Park Service–National Geographic Society Wetherill Mesa Project, which late in 1958 began studying and restoring long-vanished cliff dwellings in the southwest portion of Mesa Verde National Park, Colorado. The group, under National Park Service staff archaeologist Douglas Osborne, charted more than 100 cliff and cave dwelling sites. It began excavation on Long House, one of three large cliff ruins whose fortresslike dwellings and ceremonial kivas were abandoned by their Indian builders 700 years ago.

Previously unrecorded varieties of pygmy parrot, spiny-tailed babbler, leaf warbler, and other birds were among 492 bird study-skins collected on New Britain Island by E. Thomas Gilliard of the American Museum of Natural History. His 10-man group also collected 215 small mammal specimens in an unprecedented penetration of the island's mountainous jungles. The museum, the National Geographic Society, and the Explorers Club were joint sponsors.

A two-man, steel-hulled "diving saucer," 6½ feet in diameter, 5 feet high, and propelled by two water jets, was added to the arsenal of specialized equipment of the National Geographic Society–*Calypso* Oceanographic Expeditions in July. Designed for exploring continental shelves to depths of 900 feet, it was first used in the subsequent five-month exploration and exhibition tour of the research ship *Calypso,* led by Capt. Jacques-Yves Cousteau. The ship visited the Canary Islands, Bermuda, New York City (during the First International Oceanographic Congress), Washington, D.C., Puerto Rico, and the Cape Verde Islands.

The National Geographic Society–Tulane University archaeological program directed by E. Wyllys Andrews entered its third season at the great ruined Mayan city of Dzibilchaltun, near present-day Mérida in Mexico's Yucatán State. Scientists completed restoration of the Temple of the Seven Dolls and related structures, and uncovered several inscribed stelae of the Early Period. Aqualung-equipped divers brought up some 15,000 pieces of pottery and wooden and bone artifacts from the depths of the cenote (natural well) in the city's ceremonial plaza.

The society, the Smithsonian Institution, and the U.S. Navy participated in a month's survey and underwater exploration of old Port Royal, Jamaica, which was submerged by earthquake in 1692. Edwin A. Link, the project's leader, supplied his 91-foot exploration ship, *Sea Diver II,* as the base for operations.

The society joined with the Montana Cooperative Wildlife Research Unit in a projected five-year study, directed by ecologists John and Frank Craighead, of the West's dwindling grizzly bears. The society continued participation for the tenth consecutive year in the University of Miami Marine Laboratory study of life stages of pelagic fishes. National Geographic grants enabled J. Lear Grimmer, associate director of the Smithsonian's National Zoological Park, to study the little-known hoatzin in its British Guiana habitat, and helped Miss Jocelyn Crane of the New York Zoological Society carry out European phases of her world-wide study of fiddler crabs.

Publications.—In 1959, as in 1958, the society issued seven 25-by-19-inch, 10-color maps of the new Atlas Series as supplements to its magazine. A total of 17 million individual maps were issued in each of the two years. The society's cartographers also produced five large 10-color wall maps recording recent changes, and 50 maps and diagrams illustrating specific articles. The society continued publication of the long-established *National Geographic News Bulletins* and *Geographic School Bulletins.* In October it published a 512-page, color-illustrated book, *America's Wonderlands—The National Parks,* describing 82 scenic and historic national park areas.

Awards.—Sir Vivian Fuchs, leader of the British Trans-Antarctic Expedition 1955–58, became the 18th recipient of the society's Hubbard Gold Medal in ceremonies at the White House on Feb. 4, 1959. A 19th bestowal was made at the same time by President Eisenhower, on behalf of the society, to the U.S. Navy Antarctic Expeditions of 1955–59.

Officers.—Society officers in 1959 were: Melville Bell Grosvenor, president and editor; Thomas W. McKnew, executive vice president and secretary; Robert V. Fleming, vice president and treasurer; Melvin M. Payne, vice president and associate secretary; and Frederick G. Vosburgh, vice president and associate editor. Gilbert Grosvenor was chairman, and John Oliver La Gorce, vice chairman, of the Board of Trustees, and Lyman J. Briggs was chairman, and

Alexander Wetmore, vice chairman, of the Committee for Research and Exploration. (John Oliver La Gorce died on Dec. 23, 1959.)

MELVILLE BELL GROSVENOR,
President and Editor.

NATIONAL GUARD. Army.—The federally recognized strength of the Army National Guard was 394,272 officers and enlisted men on Aug. 31, 1959. During 1959, the Army National Guard was reorganized to provide the type of forces required to augment the active Army if mobilized in a national emergency. In addition to the revision of the tactical organization structure, the reorganization included a Combat Arms Regimental System, a nontactical, flexible framework of permanent "parent regiments" for all armor, artillery, and infantry Guardsmen. This system preserves the Army National Guard's most renowned regiments and permits each Army Guardsman to become a member of a distinguished "home outfit" with a tradition of accomplishment. Under the reorganization the Guard's more than 5,300 units were cut to 4,497, organized into 21 infantry and 6 armored divisions, 34 missile battalions, 56 field artillery battalions, 11 separate infantry battle groups, 8 armored cavalry regiments, and other combat and support units.

During the fiscal year 1959, 49,841 Army Guardsmen without prior military service entered training for six months with the active Army. A total of 85,529 Army Guardsmen have completed this training. Agreement to enter the program was made a condition of enlistment in 1957.

In the year ending June 30, 1959, all Army National Guard units conducted 48 paid training assemblies. More than 331,700 Army Guardsmen attended 15 days of annual active duty for training, and more than 7,572 were enrolled in courses at Army service schools.

By July 20, 1959, 28 air defense batteries of the Army National Guard had taken over or were about to take over from the active Army the full-time operation of Nike-Ajax installations. Four of these batteries had assumed an active role in the nation's surface-to-air missile defense in 1958. In January 1959 two battalions of the Hawaii National Guard began training for round-the-clock operation of Nike-Hercules installations.

Air National Guard.—On Aug. 31, 1959, the Air National Guard was composed of 70,641 federally recognized officers and airmen. Its 567 units were organized into 24 combat wings and additional support units operating from 94 flying fields and 42 nonflying installations.

The last of the Air National Guard's 82 combat squadrons to convert from propeller-driven to jet aircraft made the change-over during the fiscal year 1959. On June 30, 1959, the aircraft inventory totaled 2,425. During the year, fighter squadrons continued to learn the techniques of delivering nuclear weapons, and four squadrons received F-89H aircraft capable of carrying Falcon missiles. This made a total of five squadrons equipped to use the radar-guided, air-to-air weapon. In addition, the Air National Guard began to equip three fighter squadrons with the Sidewinder, a solid-propellant missile guided by heat from the target aircraft.

During the fiscal year 1959, Air Force schools graduated 191 National Guard pilots and navigators and provided technical training for more than 3,400 officers and airmen. The Air National Guard's Jet Instrument School graduated 351 pilots. A total of 8,001 airmen completed basic training with the active Air Force, and 1,284 of these extended this training up to six months. More than 64,300 Air Guardsmen attended 15 days of annual active duty for training, and all units held 48 paid training assemblies.

MAJ. GEN. DONALD W. MCGOWAN,
Chief, National Guard Bureau.

NATIONAL INCOME AND PRODUCT. See INCOME.

NATIONAL LABOR RELATIONS BOARD. In its 12th year of administering Title I of the Labor-Management Relations (Taft-Hartley) Act of 1947, the National Labor Relations Board, as of June 30, 1959, was composed of Chairman Boyd Leedom and members Philip Ray Rodgers, Stephen S. Bean, Joseph Alton Jenkins, and John H. Fanning. On March 26, 1959, President Dwight D. Eisenhower appointed Stuart Rothman, formerly solicitor of the U.S. Department of Labor, as the board's new general counsel.

Jurisdiction in the Hotel Industry.—During the year the board began to exercise jurisdiction over hotels, motels, and similar establishments, pursuant to a Supreme Court decision which held that the board could not continue its 22-year-old policy of declining to assert jurisdiction in this industry. The new jurisdiction, to take immediate effect, applies to cases pending before the agency and to all future cases involving hotels and motels which do a gross annual business of $500,000 or more.[1]

The board estimated that on the basis of 1954 Census Bureau figures the new standard would bring more than 60% of the hotel industry's 377,000 employees within board jurisdiction. No such estimate was possible as to how many of the nation's 15,070 motels or their 43,000 employees would be included under the new jurisdictional standard.

Taft-Hartley Act Amendments.—The Labor-Management Reporting and Disclosure (or Landrum-Griffin) Act, which was signed into law by President Eisenhower on Sept. 14, 1959, contains certain amendments to the Taft-Hartley Act affecting the National Labor Relations Board's administration of that law. Most of the amendments became effective Nov. 13, 1959.

One amendment is designed to eliminate the "no man's land" existing between the board's jurisdiction over labor-management conflicts and that of state courts and agencies by permitting the states to take cases which the board would decline. In order to make clear what cases it will take, the board has established procedure for advisory opinions on jurisdiction; these are made available only to state courts or agencies, or parties to state proceedings. Another amendment limits picketing or threats of picketing by a union in certain circumstances to organize employees or to compel an employer to grant bargaining recognition, but the limitations apply only to those unions not currently certified as bargaining agents by the NLRB.

In the new act, Congress undertook to plug what it regarded as "loopholes" in the Taft-Hartley ban on secondary boycotts, and it adopted a broadly worded prohibition (with certain exceptions) against so-called "hot cargo" agreements and other express or implied contracts requiring an employer to cease or refrain from doing business with any other person. Another provision gives employees on strike for economic reasons (such as for wages or working conditions) the right to vote in representation elections supervised by the NLRB, and subject to the board's regulation, if elections are held within 12 months after the start of the strike. The new law also repealed the requirement under the Taft-Hartley Act that a union must file non-Communist affidavits and financial reports with the board in order to bring a case before it.

Case Activity.—During fiscal year 1959, the board received a record number of cases of all types. There were 21,632 cases filed, representing an increase of 29% over the 16,748 cases filed during the preceding year.

The number of charges filed against either employers or unions reached a new high. Charges filed against employers numbered 8,266, an increase of about 36% over the 6,068 charges filed

[1] Excepted are residential hotels, which the board defines as hotels in which at least 75% of the guests were in residence for a month or more during the preceding year.

in fiscal year 1958; 3,973 were filed against labor organizations, an increase of about 24% over the previous year's 3,192.

For the second year, charges filed by individuals (7,176) constituted a majority (59%) of all charges of unfair labor practices. More unfair labor practice cases were brought to a conclusion by the agency than ever before. A total of 11,465 unfair practice cases were closed, an increase of 57% over the 7,289 cases closed in the preceding year.

The general counsel issued more complaints in unfair labor practice cases than in any other year in the board's history. A total of 976 complaints were issued: 601 against employers, 241 against labor organizations, and 134 against both employers and unions.

The number of petitions for injunctions filed by the general counsel also reached an all-time high. Petitions for injunctive relief were filed in 135 cases (134 in the preceding year). The courts granted relief in 57 instances.

The 291 decisions issued by the board in contested unfair labor practice cases was the third highest since 1953. In fiscal year 1958, the board issued 222 such decisions.

Petitions for representation elections totaled 9,346, the greatest number filed since 1952. In the 1958 fiscal year, 7,399 such petitions were filed.

During fiscal year 1959, the board conducted a total of 5,660 representation elections, as compared with 4,524 in fiscal year 1958. In these elections, 447,322 employees were eligible to vote, as compared with 363,672 in 1958. (About 90% of those eligible to vote cast valid ballots. This equaled the participation in fiscal year 1958, which was the highest percentage in the history of government-conducted elections.)

Most of the elections conducted by the board were held pursuant to agreement by the parties. In the 1959 fiscal year, 73% of all elections were based on all-party agreements, as compared with 72% in 1958. Labor organizations won majority designations in 62% of the elections, as compared with 60% in 1958.

JAY E. SHANKLIN,
Associate Director of Information.

NATIONAL PARKS AND MONUMENTS. The dynamic Mission 66 park conservation and development program, in its fourth year in 1959, continued to improve and expand the facilities and services of the scenic, scientific, and historic units of the National Park System. Mission 66, so designated because its completion is scheduled to coincide with the 50th anniversary of the National Park Service in 1966, has as its primary objective a National Park System equipped and staffed to serve 80 million or more visitors each year. There were 62 million visitors in 1959, an increase of 4 million over the 1958 total, and 30 million more than ten years ago.

Since the start of the Mission 66 program, some $100 million in federal capital has been invested to provide new and better roads, trails, parkways, utility systems, campgrounds, trailer courts, visitor centers, and other public-use facilities and interpretive services. Park concessioners have invested approximately $17 million in private capital for new hotels, lodges, cabins, restaurants, stores, and other accommodations.

Significant progress has also been made under Mission 66 toward providing, with the cooperation of other federal agencies and state and local governments, a nationwide inventory of existing and potential park and recreation areas and facilities. Nationwide surveys of historic sites and buildings are also under way.

Three new areas were added to the National Park System in 1959. A proclamation, signed by President Dwight D. Eisenhower, established the Horseshoe Bend National Military Park, in Alabama, thus preserving the site of the Battle of Horseshoe Bend, fought in 1814, in which General Andrew Jackson's forces were victorious over the Creek Indians. An eight-acre tract in Lincoln, Mass., was designated as the Minute Man National Historic Site. This site contains the original stone walls, boulders, and other features of the natural setting where on the opening day of the American Revolution (April 19, 1775), Colonial Minute Men fired on British troops retreating from Concord to Lexington. In New York City, Grant's Tomb, the imposing granite structure in Riverside Park, where General Ulysses S. Grant and his wife, Julia Dent Grant, are buried, was established as the General Grant National Memorial.

Glenmont, in West Orange, N.J., for many years the home of the famed inventor, Thomas A. Edison, was made a part of the Edison Laboratory National Monument. Mikveh Israel Cemetery in Philadelphia, Pa., containing the graves of a number of outstanding patriots of the American Revolution, was added to the Independence National Historical Park, as was also the Old Philadelphia Custom House, previously a national historic site.

AREAS ADMINISTERED BY THE NATIONAL PARK SERVICE
(As of Sept. 1, 1959)

Type of area	Number	Federal land (acres)
National parks	29	13,103,529
National historical parks	8	31,968
National monuments	83	8,988,409
National military parks	12	26,538
National memorial parks	1	68,708
National battlefield parks	3	5,530
National battlefield sites	5	189
National historic sites	10	1,362
National memorials	13	4,437
National cemeteries	10	215
National seashore recreation areas	1	24,705
National parkways	3	89,814
National capital parks	1[1]	38,528
National recreation areas	3	2,013,768
Total	182	24,399,700

[1] Includes Catoctin Mountain Park, Chesapeake and Ohio Canal, Prince William Forest Park, Baltimore-Washington Parkway, Suitland Parkway, among the 781 units administered.

The new 49-star flag of the United States was raised officially for the first time at Fort McHenry National Monument, Baltimore, Md., at exactly one minute after midnight, July 4, 1959, by Secretary of the Interior Fred A. Seaton.

On the afternoon of July 4, Secretary Seaton delivered the main speech at ceremonies dedicating the Cumberland Gap National Historical Park, which lies in Kentucky, Virginia, and Tennessee. Two other units of the National Park System—Fort Union National Monument, New Mexico, and Badlands National Monument, South Dakota—also were dedicated in 1959.

CONRAD L. WIRTH,
Director, National Park Service.

NATIONAL SCIENCE FOUNDATION. The National Science Foundation is an independent agency of the federal government created by Congress in 1950 to promote scientific progress by supporting fundamental investigations in the mathematical, basic research and education in the sciences. Its grants to institutions of higher learning finance fundamental investigations in the mathematical, physical, engineering, biological, and social sciences, and its fellowships to scientists, teachers, graduate students, and special projects in science education help to increase the nation's reservoir of scientific manpower. Other programs provide data on scientific personnel, with estimates of future

national needs; support a continuing Antarctic research program; promote dissemination of scientific information; and develop policy proposals for the promotion of basic research.

During the fiscal year 1959, the foundation made 1,809 grants to 333 institutions in 50 states, the District of Columbia, Puerto Rico, Argentina, Bermuda, Canada, France, Israel, and Turkey. Expenditures for research totaled $64,686,329, including $15,564,800 for facilities. The average research grant during this period was about $25,000 for roughly two years. The amount of the average grant has increased by 40 per cent during the past year.

Included in the foundation's research assistance in the past year were $3 million in 15 grants for biological research facilities, including $1.5 million for a controlled environment laboratory for the study of plants and animals at the University of Wisconsin; $1.1 million for a research program on weather modification; $4.7 million for studies related to Antarctica; a feasibility study of a project to orbit an astronomical telescope in an earth satellite; $4 million for the construction of a solar telescope at Kitt Peak National Observatory; Project Stratoscope, to photograph the sun using a high-altitude balloon (see ASTRONOMY); and a project to record high-energy cosmic particles on photographic film suspended from balloons at extreme altitudes.

The foundation awarded 3,937 fellowships for the 1959–60 academic year, with a total value of $13.1 million. These included 1,100 predoctoral, 194 postdoctoral, 83 senior postdoctoral, 302 science faculty, 1,050 cooperative graduate, and 20 NATO science fellowships, and 580 summer fellowships for graduate teaching assistants. During the 1958–59 academic year, the foundation supported 32 institutes for high school teachers of science and mathematics, and 162 in-service institutes offering after-hour courses. Total support of institutes in the past fiscal year was $33.6 million.

Major publications of the past year include: *Providing U.S. Scientists with Soviet Scientific Information; Funds for Research and Development Performance in American Industry, 1957 (Preliminary Report); Research and Development and Economic Growth; Recent Legislative and Executive Actions on the Federal Budget for Scientific Research and Development, Fiscal Years 1958 and 1959; Current Research and Development in Scientific Documentation; Proceedings of a Conference on Research and Development and Its Impact on the Economy; NSF Programs for Education in the Sciences; NSF Program Activities;* and the *NSF Annual Report.*

ALAN T. WATERMAN,
Director.

NATIONAL SECURITY—U.S. MILITARY POLICY. Early assessments of the visit by Soviet Premier Nikita Khrushchev to the United States in September 1959 included speculation that a gradual thaw in the cold war might be possible. His broad proposals for general disarmament and his agreement to negotiate some outstanding conflicts were welcomed cautiously by the United States and its allies. Pending more concrete evidence of Communist intentions, however, the United States continued its reliance on powerful military forces to preserve peace and security.

As in previous years, the level of defense efforts and the apportionment of funds between general war and limited war forces remained subjects of public controversy. President Eisenhower announced that he was determined not to indulge in the "feverish building of vast armaments to meet glibly predicted moments of so-called 'maximum peril,' because the threat we face is not sporadic or dated; it is continuous." In general, this view prevailed with the Congress, although several Democratic members had urged higher appropriations. Some adjustments, however, were made in the president's budget by Congress to increase funds available for modernization of the Army and for defense against ballistic missiles.

Mutual Security.—Collective security continued to be the cornerstone of United States defense policy. Through bilateral defense agreements and regional treaty organizations, including the North Atlantic Treaty Organization (NATO) and the Southeast Asia Treaty Organization (SEATO), the United States was allied with over 40 nations. Believing that Communist threats could be met by local forces, aided if necessary by reinforcements from other free nations, the United States strengthened its allies and neutral nations through military and economic aid. New foreign aid appropriations for the fiscal year 1960 totaled $3.226 billion, including $1.3 billion of military aid. In November 1959, Gen. Williston B. Palmer, previously deputy commander of the United States forces in Europe, was appointed to the newly created post of chief of staff in charge of military foreign aid. (See also FOREIGN AID PROGRAMS, U.S.)

The Berlin Ultimatum.—Potentially, the most dangerous situation in 1959 revolved about the status of Berlin. Although the United States, Great Britain, and France were firmly committed to protecting the 2 million people of West Berlin against the Communists, the Soviet Union asked on Nov. 27, 1958, that the three powers withdraw their forces within six months to end the occupation. Berlin was only part of the larger question of the unification of Germany, and the Russians apparently hoped that the application of pressure against the exposed outpost at Berlin might secure favorable consideration of their plans for safeguarding East Germany's interests and for establishing a zone of military disengagement in central Europe.

While talks at the diplomatic level dragged on, the deadline passed without incident; but the threat remained. A Soviet miscalculation in Berlin might well have sparked the outbreak of a general war. Following Premier Khrushchev's consultation with President Eisenhower in September, the strain subsided with the announcement that further negotiations would be initiated to work out a solution to the German problem without any fixed time limit. (See also GERMANY; SUMMIT CONFERENCE.)

NATO and CENTO.—Concern over Berlin could not obscure other clouds in Europe. Under President Charles de Gaulle, France was eager to play a more important role in NATO affairs and to secure equality with the United States and Great Britain in atomic capabilities. In view of lack of progress in negotiating a mutually satisfactory agreement over atomic weapons stockpiling, the United States shifted 200 fighter-bombers from France to other NATO countries in July. The triumphal tour of President Eisenhower to Bonn, London, and Paris in August, and his subsequent return to Paris in December, along with other developments, have helped to relieve some of the tensions among the chief partners in the NATO alliance, but the role of France in the organization will surely come up again. (See also FRANCE; NORTH ATLANTIC TREATY ORGANIZATION.)

Following the defection of Iraq from the Baghdad Pact in March 1959, this alliance was renamed the Central Treaty Organization (CENTO). Although not a member, the United States assisted in the work of the organization and signed new bilateral executive agreements with the three Middle Eastern CENTO states, Iran, Pakistan, and Turkey. Described by some observers as an extension of the Eisenhower Doctrine, the agreements committed the United States to aid the three sig-

natories in preserving peace and security. The United States had terminated deliveries of military equipment to Iraq after the 1958 revolt, and in May 1959 the new Iraq government formally ended its military assistance agreement with the United States. (See also MIDDLE EAST.)

Chinese Communist aggressiveness in Asia caused especially grave concern in India and throughout Southeast Asia. After military intervention in Tibet, Chinese forces moved into disputed frontier positions along the Indian border. In July, fighting broke out in Northern Laos between Royal Lao government forces and North Vietnamese-backed guerrillas. As the government troops were forced back in August, the Lao government appealed to the United States for assistance. Joint United States–French teams were set up to improve the quality of the Laotian Army, and additional small weapons were flown in. In September a United Nations fact-finding committee was sent to Laos, and the Communists diminished their attacks. The subcommittee report to the United Nations documented considerable evidence of Viet-Minh involvement, support, and assistance to the Communist forces in Laos, but could not substantiate that there had been an invasion of Laos by regular units of North Vietnamese forces. The secretary general of the United Nations, Dag Hammarskjöld, visited Laos in November in a further effort to dampen the military activities of the Communists.

Progress in Disarmament.—In the field of disarmament, the outlook brightened during 1959. Some progress had been made during 1958 at the Geneva talks on the banning of nuclear explosions, but these were broken off in December 1958 when a deadlock developed about the system of inspection to detect violations. Negotiations resumed in January 1959, and gradually the Soviet and Western differences on controls narrowed. The USSR agreed that a limited number of inspections might be permitted, and that part of the detection staffs based in the USSR might be provided by Great Britain and the United States. It also consented to a joint technical study of the problem of detecting nuclear explosions at high altitudes and in space. In August the United States, Great Britain, and the Soviet Union announced that they would not conduct atomic tests during the rest of 1959. August also marked the establishment of a new 10-nation council on disarmament with five Western members (United States, Great Britain, France, Italy, and Canada) and five Communist representatives (USSR, Poland, Czechoslovakia, Rumania, and Bulgaria).

But the outstanding development in disarmament came during Premier Khrushchev's address to the United Nations on September 18. He proposed complete and general disarmament of all nations within a four-year period as the answer to the nuclear arms race. There was little doubt that his suggestion, which was similar to one made by the Soviet Union in 1932, would receive careful attention; but the means and methods of accomplishing equitably such a massive undertaking remained to be discovered and discussed. (See also DISARMAMENT.)

Space and Missiles.—The Air Force was designated as the official military space force in September 1959, and given sole responsibility for space transportation. The Army and Navy will be restricted to satellites for navigation and communications. The Advanced Research Projects Agency (q.v.) is to continue its work on defense against ballistic missiles and on solid rocket fuels.

Research programs in 1959 laid heaviest stress on the development of guided missiles. Deliveries of Thor IRBM's (intermediate-range missiles) were made to the United Kingdom, and Italy agreed to accept Jupiter IRBM's from the United States. Four nuclear submarines to be equipped with the Polaris missile were launched in 1959. Progress on the missile itself continued, and there was hope that the complete Polaris weapon system would become operational in late 1960. With the first operational firings of the Atlas ICBM (intercontinental ballistic missile) at Vandenberg Air Force Base, Calif., in September 1959, the 6,000-mile missile began to take its place beside the Strategic Air Command bombers. At the end of 1959, construction of 11 more ICBM bases in the United States was under way—six for the Atlas and five for the improved Titan. A third ICBM, the second-generation, solid-propellant Minuteman, was also under development.

Missiles have almost completely supplanted antiaircraft artillery and machine guns for defense against aerial attack. Surface-to-air Nike missiles have been deployed by the Army, and Terrier and Talos missiles by the Navy, for ground and ship defense; while air-to-air Falcons, Sidewinders, and nuclear-armed Genies are becoming the principal armament of fighter-interceptor aircraft.

Ground forces of the United States and its allies also have turned increasingly to missiles for added firepower. Matador, Mace, Corporal, and Redstone missiles and Honest John rockets, all of which can be fitted with atomic warheads, were deployed in additional numbers at home and overseas in 1959 to strengthen the capability of land forces to counter aggression. (For details of the United States missile program, see MISSILES; and for a discussion of progress in space exploration, see SPACE FLIGHT.)

Continental Defense.—Congressional opposition to the level of appropriations proposed by the Department of Defense for air defense missiles led to the adoption of a "master air defense plan" in June 1959. This plan called for three concentric defense rings against manned enemy aircraft: the Nike-Hercules, with a range of about 80 miles, as the inner ring; the 200-mile-range Bomarc and the 400-mile-range Bomarc B (when it becomes operational) as the second line of defense; and manned interceptors at the outer edge, to engage enemy intruders as far from target areas as possible. Additional funds were provided by Congress in 1959 to permit acceleration in fiscal 1960 of the Nike-Zeus program for developing defenses against long-range missiles.

Command and coordination of the air defense efforts of the United States and Canada in 1959

remained the responsibility of the North American Air Defense Command, with headquarters at Colorado Springs, Colo. During 1959, Canada began to provide a majority of the personnel manning the Distant Early Warning (DEW) line along the Arctic Circle. The DEW line was extended in April 1959 with the opening of six stations in the Aleutian Islands. Construction work was also progressing on schedule on three far northern stations for early warning against ballistic missiles.

Armed Forces Strength.—During late 1958 and early 1959 the number of military personnel on active duty was reduced by about 96,000, reaching a point slightly below the strength programed for June 30, 1960. The adjustment in the size of the military services began after the conclusion of the Korean War.

Personnel strengths in the armed forces were as follows:

	Actual		Planned
	June 30, 1958	June 30, 1959	June 30, 1960[1]
Army	898,925	861,964	870,000
Navy	641,005	626,340	630,000
Marine Corps	189,495	175,571	175,000
Air Force	871,156	840,435	845,000
Total, armed forces	2,600,581	2,504,310	2,520,000

[1] Some reductions were under study at the end of 1959.

On June 30, 1959, about 63% of military personnel were serving in the operating forces, about 17% in supporting forces, 17% in training forces, and the remaining 3% were patients or in transit. Personnel assigned to duty outside continental United States and to sea duty, together with troops stationed in Alaska, amounted to 40% of United States armed forces manpower.

Personnel Policies.—Emphasis in the manpower programs of the armed forces has shifted in the past few years from filling requirements for large numbers of men to meeting the acute need for highly qualified personnel that can man and service modern weapons systems. To improve the appeal of military life, 11,994 men had been promoted by June 30, 1959, to the two new senior enlisted grades authorized in 1958 by Congress. In addition, about 47,000 enlisted personnel, primarily in critical technical assignments, began drawing an extra $30 per month in proficiency pay without an increase in rank.

On June 30, 1959, the Department of Defense was using 1,078,000 direct-hire civilian employees (a reduction of 19,000 during the year), and 188,000 foreign nationals were employed overseas under contractual arrangements with foreign governments (28,000 fewer than on June 30, 1958).

Reserve Forces.—Ready Reserve units were streamlined during 1959 to meet the requirements of modern warfare. The Army National Guard and the Army Reserve made substantial progress in converting their divisions to the new pentomic organization recently adopted in regular Army units. The Navy greatly expanded its selected reserve program through which reservists are trained on the ships or in the aircraft which they would man immediately on the outbreak of hostilities. The Air Force completed the reorganization of its 15 Air Reserve wings for troop carrier operations and its 24 Air National Guard wings for fighter-interceptor and tactical ground support missions.

In addition to training men for emergency service, the Ready Reserve has also assumed important peacetime missions in support of the active forces. Some 22 Air National Guard squadrons regularly participate as active air defense forces, while Army National Guard units have begun to man operational Nike-Ajax guided-missile air defense sites.

In June 1959 the Ready Reserves of the Army, Navy, Marine Corps, and Air Force totaled 2,456,000, excluding 247,000 Ready Reservists on extended active duty. The Standby Reserve, which could be recalled to duty only in the event of war, numbered 1,770,000, an increase of 291,000 in the past year, and the Retired Reserve numbered 128,000.

Defense Budget.—Expansion of research and development programs, increased procurement of modern weapons, and higher personnel costs made the major contribution to the 5% rise in defense expenditures during fiscal 1959. With this increase, expenditures by the Department of Defense for military functions totaled $41.3 billion, as compared with $39.1 billion the preceding year. In addition, $2.4 billion was expended in providing military assistance to allied forces.

In January 1959 the president requested $39.248 billion to support the regular military functions of the Defense Department in fiscal 1960. An additional $1.6 billion for military construction was requested in March. Congress reduced the president's requests by only $20 million in regular military funds and $200 million in military construction funds.

New funds made available by Congress for the Department of Defense in the regular and construction appropriation acts were as follows:

WIDE WORLD

Members of the Joint Chiefs of Staff are (from left) Gen. Lyman L. Lemnitzer (Army), who was sworn in on July 1 to succeed Gen. Maxwell D. Taylor; Adm. Arleigh A. Burke (Navy); Gen. Nathan F. Twining (chairman); Gen. Thomas D. White (Air Force); and Gen. Randolph McC. Pate (Marines), who was succeeded on Jan. 1, 1960, by Gen. David M. Shoup.

	Fiscal 1958	Fiscal 1959	Fiscal 1960
	(billions of dollars)		
Army	7.7	9.3	9.7
Navy	10.5	11.8	11.2
Air Force	17.8	18.8	18.3
Secretary of Defense and interservice activities	0.7	1.4	1.4
Total	36.7	41.3	40.6

Administration.—Secretary of Defense Neil H. McElroy resigned on Dec. 1, 1959, and was succeeded by Deputy Secretary Thomas S. Gates, Jr. On December 10, James H. Douglas, secretary of the air force, was named deputy secretary of defense; and Air Under Secretary Dudley C. Sharp was appointed to succeed Douglas as secretary of the air force. Secretary Gates, the former secretary of the navy, had become deputy secretary of defense after the death of Donald A. Quarles in May 1959. At the same time, William B. Franke, previously under secretary of the navy, succeeded Gates as secretary of the navy, and Dr. Herbert F. York was named to the new post of director of defense research and engineering. Gen. Lyman L. Lemnitzer succeeded Gen. Maxwell D. Taylor as army chief of staff on July 1, 1959; and Maj. Gen. David M. Shoup was selected to replace Gen. Randolph McCall Pate, when the latter retired as commandant of the Marine Corps at the end of 1959.

On Aug. 6, 1959, the Department of Defense completed its first year of operations under the Defense Reorganization Act of 1958. This legislation established a direct line of authority from the president through the secretary of defense and the Joint Chiefs of Staff to major operating forces in the field. The Continental Air Defense Command and regional commands in Alaska, the Atlantic, the Caribbean, Europe, and the Pacific are unified commands, composed of units from all the services, while the Strategic Air Command and the naval forces in the Eastern Atlantic and Mediterranean are composed of forces from a single service, responsible directly to the secretary of defense. Commanders of these forces have been given full operational control over all units assigned to them.

NATURALIZATION. See IMMIGRATION AND NATURALIZATION.

NAURU. Annexed by Germany in 1888 and surrendered to Australian forces early in World War I, this coral island (area, 8.22 square miles) lies close to the equator some 2,200 miles northeast of Sydney, Australia. After 1920 it was a League of Nations mandate, and since 1947 it has been a United Nations trust territory for which

Australia, New Zealand, and the United Kingdom are jointly responsible. Australia appoints the administrator (in 1959, J. Preston White). The population on June 30, 1959, totaled 4,258, comprising 2,196 Nauruans (a mixture of Polynesian, Micronesian, and Melanesian types), 975 other Pacific Islanders, 375 Europeans, and 712 Chinese.

A 9-member elected Local Government Council advises the administrator on Nauruan affairs. In 1957–58, revenue totaled £A352,686; expenditure, £A357,396 (the Australian pound equals U.S.$2.24). Primary and secondary school pupils numbered 871 on June 30, 1959. Of the island's 5,263 acres, 5,049 are owned by individual Nauruans. The British Phosphate Commission, appointed by the trusteeship powers, employs most of the male Nauruans and also works the deposits on Ocean Island, Gilbert and Ellice Islands Colony (see WESTERN PACIFIC ISLANDS, BRITISH), and Christmas Island (q.v.).

Medical, social, and educational services are the responsibility of the administration, and are financed by the British Phosphate Commission from phosphate production (1,167,180 tons, valued at £A3,358,894, exported in 1957–58). An airfield capable of accommodating large transport aircraft has been constructed, but there is not as yet a regular air service.

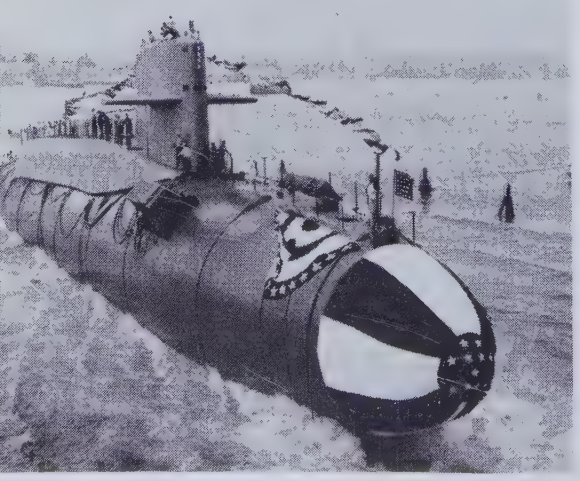
NAVIES, World. See articles on major countries.

NAVY, U.S. The new secretary of the Navy, William B. Franke, has expressed the role of the Navy in these words: "The role of the Navy is still—and always will be—the control of the seas during periods of conflict and maintaining the freedom of the seas in time of peace."

Chief of Naval Operations Arleigh Burke, who received in 1959 a nonroutine reappointment for an additional two-year term, elaborated the role, in a Navy Day (Oct. 27, 1959) open letter, as follows: ". . . Yet, the ways, means and forces which are now on station to discharge these responsibilities have changed greatly over the past few years. Nuclear ships with almost unlimited cruising range are coming into the forces afloat in ever-increasing numbers. Guided missile ships are now accepted parts of the naval task force. The first ballistic missile-carrying submarine, the *George Washington,* should be at sea about the time another Navy Day rolls by. The Anti Submarine Task Groups have proved to be a tremendous aid in the rapidly developing ASW [antisubmarine warfare] techniques. The task forces that roam the oceans of the world today pack more punch in fewer ships than the entire Navy did just a few short years ago . . . There is one thing, though, that has remained constant—the fiber of the men who man the ships and planes."

The nuclear submarine U.S.S. *George Washington* is launched at Groton, Conn., June 9. First submarine equipped to fire the Polaris missile, she was commissioned on December 30.

GENERAL DYNAMICS CORPORATION



Administration and Personnel.—On June 8, 1959, William B. Franke took office as secretary of the Navy, succeeding Thomas S. Gates, Jr., who became secretary of defense. Officers assigned to new positions in 1959 include the following: Admiral Robert W. Dennison, commander of the U.S. Atlantic Fleet and of NATO Atlantic Forces; Admiral Herbert G. Hopwood, commander of the U.S. Pacific Fleet; Admiral Harold P. Smith, commander of the U.S. Navy's Eastern Atlantic and Mediterranean forces; and Gen. Daniel M. Shoup, commandant of the Marine Corps (q.v.). The Navy's manpower at the beginning of 1959 totaled 641,000 officers and men; this force was reduced by 11,000 during the year, and is expected to remain constant at 630,000 in 1960.

Ships.—The Navy began the year 1959 with 393 combat ships and 10,654 aircraft, of which 41% were jets. Of the 393 combat ships, 26 were aircraft carriers, including 15 attack, 9 antisubmarine, and 2 helicopter carriers; 15 were cruisers, of which 3 were equipped with guided missiles; 240 were destroyers, including one fitted with guided missiles; and 112 were submarines, of which 6 were nuclear-powered and 4 were capable of launching guided missiles. Some 2,987 other ships, including 85 patrol craft, 77 mine sweepers, 124 amphibious vessels, 212 auxiliaries, and 2,499 landing craft, rounded out the fleet. The reserve fleet totaled 1,511 vessels.

The construction program in 1959 included 3 Forrestal-type carriers; 20 guided-missile frigates; 21 destroyers, of which 18 will carry missiles; 18 nuclear submarines, of which 9 can launch guided or ballistic missiles; and 3 nonatomic submarines. By the end of the fiscal year 1960, the naval forces will include 479 combat ships—comprising 14 attack carriers, 14 cruisers, 238 destroyer types, 113 submarines, and 385 other auxiliaries—and will comprise 864 ships of all types, not including landing craft and small vessels. Operational aircraft will decline to 7,200.

Of the ships in commission in 1959, 81% were constructed during World War II. In the postwar period through 1959, an average of only 20 new ships per year has been maintained. As the effective life of naval ships is about 20 years, the World War II ships will become obsolescent between 1961 and 1965. A modern fleet of 864 ships requires 43 new ships per year. An accelerated fleet rehabilitation and modernization program is in effect for 255 units, including 6 antisubmarine carriers, 35 submarines, 163 destroyer types, and 51 amphibious ships. Full overhaul of a ship's hull, machinery, and weapons should prolong its effective life by eight years, and partial overhaul, by five years.

No nuclear-powered surface ship was in commission during 1959. The U.S.S. *Long Beach,* the guided-missile cruiser launched July 14, will probably be the first ship in this category. Other significant launchings in 1959 include those of the nuclear ballistic-missile submarines *George Washington, Patrick Henry, Theodore Roosevelt,* and *Robert E. Lee,* four of nine authorized submarines of this type; the nuclear attack submarine *Scorpion;* the submarine *Blueback,* the last nonnuclear submarine planned; and, though not a naval vessel, the nuclear-powered merchant ship *Savan-*

U.S. NAVY; UPI

(*Above*) Photograph made from a Navy balloon as it ascended to a height of 81,000 feet on November 28. Launched near Rapid City, S. Dak., the craft carried Cmdr. Malcolm Ross (*left*) and Charles Moore (*right*, with gondola). The two scientists made upper atmosphere observations of Venus which provided the first evidence of the presence of water vapor in the planet's atmosphere.

nah, launched July 21. The new carrier *Independence* was commissioned early in the year, and the nuclear radar-picket submarine *Triton* joined the fleet on August 6.

Three new types of ship are in prospect: a hydrofoil patrol craft for coastal use; an aviation transport dock vessel to carry helicopters, seagoing landing craft, and fully equipped troops; and an escort research ship. This latter vessel is intended to determine the best configuration for ocean escort and picket types carrying the latest sonar gear. The keel of the U.S.S. *Iwo Jima*, the first helicopter assault ship, was laid in May.

Skyrocketing costs are of growing concern. Destroyers built during World War II cost about $9 million, but their modern counterparts cost $35 million; and a nuclear-powered frigate will cost $100 million. Missiles cost more than 100 times the amount required for conventional armament.

Aircraft and Missiles.—The decline of operational aircraft is compensated for in part by the addition of new high-performance aircraft. At the same time, work on the X-135 manned-flight research vehicle in the 3,600 mph. range is continuing. The Seamaster program for jet seaplanes was discontinued. Development of atomic-powered aircraft and airships is being investigated.

In 1959 the Navy employed five classes of missiles: sea-to-air (SA), air-to-air (AA); air-to-sea (AS), sea-to-sea (SS), and the fleet ballistic missile (FBM). Progress toward the perfection of the Polaris ballistic missile is noteworthy. It is expected to be operational in 1960, and its potentialities for surface launching, as demonstrated by the ballistic launching ship *Observation Island*, are being increasingly appreciated. On Aug. 1, 1959, the first official missile mail delivery was made of 3,000 envelopes from the submarine *Barbero* to Mayport, Fla.—a distance of 100 miles. The flight in a Regulus missile required 22 minutes.

Research.—The importance the Navy accords to research was strikingly demonstrated by plans made in 1959 to create a new civilian post of asistant secretary for research and development. This will require the elimination of one of the existing three assistant secretary positions.

Meanwhile, the extension of basic and applied scientific and technological research goes rapidly forward. Prime examples are the research studies on a ground proximity vehicle and pump-jet ship propulsion, and the vastly significant Antarctic program which was headed by Admiral George J. Dufek (see ANTARCTICA). Basic oceanographic research is widespread, and with the development of the 72-ton bathyscape *Trieste*, which has been described as a submarine balloon, deep-water exploration seems for the first time to be feasible (see MARINE BIOLOGY; OCEANOGRAPHY). Although the Vanguard satellite program was discontinued, interest and research in outer space and allied matters continues (see SPACE FLIGHT). The Navy is contributing its full share in the field of research, not for war, but in the interest of continuing peace.

VERNON D. TATE,
Professor and Librarian, U.S. Naval Academy.

NEBRASKA. Central state, United States; admitted to the Union, March 1, 1867. The "Cornhusker State" ranks 15th in area and 34th in population among the 50 states.

Area and Population.—Area: 77,227 square miles (land, 76,663; inland water, 564), divided into 93 counties. Population: (1950) 1,325,510; (est., July 1, 1958) 1,434,000. Urban places with populations above 10,000 (as estimated by the Department of Business Research, University of Nebraska, for 1958) are:

Beatrice	12,498	Lincoln (*capital*)	130,439
Columbus	12,526	Norfolk	14,197
Fremont	19,407	North Platte	18,400
Grand Island	28,001	Omaha	300,192
Hastings	22,154	Scottsbluff	14,253
Kearney	14,576		

Executive.—Chief state officers in 1959:
Governor: Ralph G. Brooks (Democrat)
Lieutenant Governor: Dwight W. Burney
Secretary of State: Frank Marsh
Treasurer: Richard R. Larsen
Attorney General: Clarence S. Beck
Auditor of Public Accounts: Ray C. Johnson
Commissioner of Education: F. B. Decker

Constitution and Judiciary.—The present constitution went into effect in 1875. The Supreme Court comprises seven justices; chief justice in 1959: Robert G. Simmons.

Legislature.—Nebraska is the only state having a unicameral legislature. This nonpartisan body of 43 senators meets in odd-numbered years commencing the first Tuesday in January. (See below, *Principal Events, 1959.*)

Finance.—In the 1958–59 fiscal year, state revenue of $164,530,337.75 comprised $118,431,940.23 from state sources and $46,098,397.52 from the federal government. Tax revenue consisted of $44,210,740 from motor fuel taxes, $8,704,668 from licensing, and $65,516,532.23 from all other state tax sources. Expenditures of $140,665,652.53 comprised $32,383,352.92 for education, $39,320,429.90 for health, welfare, and safety, $56,264,291.53 for highways, and $12,797,578.18 for other purposes. The state had no long-term indebtedness.

Banking.—As of June 10, 1959, the state's 123 national banks had $1,197,893,000 in assets, $935,511,000 in demand deposits, and $127,223,000 in time deposits. The 295 state banks (June 30, 1959) had assets of $526,906,743, demand deposits of $405,967,852, and time deposits of $65,453,227.

Education.—School attendance is compulsory between the ages of 7 and 15, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $72,749,036 ($299.58 per pupil), comprising $58,925,997 from local school districts, $7,242,598 from the counties, $3,856,309 from the state, and $2,724,132 from the federal government. Outlays for construction and improvements amounted to $16,033,919, and teachers' salaries averaged $3,321.83 (high school, $3,969.18; elementary, $3,020.32).

In the 1957–58 school year there were 3,902 public elementary schools with 9,067 teachers and 191,412 pupils, and 483 public secondary schools with 4,223 teachers and 76,237 pupils. The 291 private and parochial elementary and secondary schools had 1,787 teachers and 45,608 pupils. There were also 4 teachers colleges with 300 instructors and 4,176 students. All college and university enrollment (1958–59) totaled 30,525 students.

Social Welfare.—In the 1958–59 fiscal year, public assistance expenditures from federal and state funds (excluding institutional costs) totaled $17,637,693.22, including $12,083,888.88 for the aged, $3,505,439.50 for dependent children, and $1,187,356.93 for the permanently and totally disabled. A monthly average of 23,245 persons received assistance. State expenditures for mental health activities totaled $9,579,241.14; for correctional and penal programs, $3,245,912.07.

Labor Force.—The 645,200 persons in the state's labor force in June 1959 included 191,000 agricultural workers. Nonagricultural employment was up slightly to 445,900 from 431,250 in the previous June. Of employed nonfarm workers in June 1959, 24.5% were engaged in wholesale and retail trade, 17.5% in manufacturing, and 20.8% in government employment. Unemployment dropped sharply to 8,300 in June 1959 from 17,400 reported for the previous June, and the state paid $6,281,804 in unemployment compensation during the intervening year.

Manufacturing.—There were approximately 1,600 manufacturing plants in the state in the fiscal year 1958–59, employing an average of 61,800 persons who received $284,700,000 in wages. Value added by manufacture (1957) totaled $548,906,000, and outlays for new plant and equipment amounted to $74,675,000. Production workers averaged $85.03 for an average work-week of 42.6 hours in August 1959.

Leading manufactures (1957) included food and kindred products, with 27,697 employees earning wages of $123,205,000, and with $282,176,000 in value added by manufacture; printing and publishing (5,931; $23,742,000; $47,083,000); and electrical machinery (3,696; $16,785,000; $28,017,000).

Mining.—In 1958 Nebraska ranked 28th among the states in the value of its mineral output, with 0.54% of the national total. The value of all minerals produced was 10% higher than in 1957.

NEBRASKA MINERAL PRODUCTION, 1958
(In short tons except as noted)

Mineral	Quantity	Value
Clays	108,000	$ 110,000
Natural gas (thousand cu. ft.)[1]	11,405,000	1,711,000
Natural gasoline (bbl.)	258,809	727,000
Petroleum (bbl.)[1]	20,368,000	59,882,000
Petroleum gases (bbl.)	742,333	1,565,000
Sand and gravel	10,441,000	7,945,000
Stone	3,555,000	4,747,000
Other minerals	...	14,605,000
Total	...	$90,032,000[2]

[1] Preliminary. [2] Total adjusted to eliminate duplication in value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1959 dropped to $834,336,000 from $872,103,000 in the corresponding period of 1958. For the full year 1958, income comprised $781,108,000 from livestock and livestock products, $466,636,000 from crops, and $36,941,000 from government payments. Principal income sources in 1958 were cattle, $502,047,000; wheat, $176,643,000; corn, $171,130,000; and hogs, $153,544,000.

NEBRASKA CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Barley (1,000 bu.)	4,855	6,710	6,969
Beans, dry edible (1,000 bags)	1,049	1,015	1,188
Corn (1,000 bu.)	204,872	293,055	350,906
Hay (1,000 tons)	5,800	7,716	6,282
Oats (1,000 bu.)	50,518	46,550	29,326
Popcorn (1,000 lb.)	17,990	53,900	29,000
Potatoes (1,000 cwt.)	3,822*	2,675	2,677
Rye (1,000 bu.)	1,800	2,822	1,937
Sorghum grain (1,000 bu.)	12,922	77,952	59,423
Sugar beets (1,000 short tons)	744	902	1,092
Wheat (1,000 bu.)	75,801	113,488	69,700

Average, 1949–57. (Source: U.S. Department of Agriculture.)

There were 102,000 farms in 1958. Total acreage (1954) of 47,487,000 included 18,874,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 4,961,000 cattle, 2,453,000 hogs, and 11,372,000 chickens (excluding commercial broilers). Some 141,000 family and hired workers were engaged in farming during the week of Nov. 22–29, 1959.

Transportation and Communications.—In 1958, state and federal spending for highways totaled $58,442,885, and 950 miles of new roads were completed.

Highways and roads on Jan. 1, 1959, totaled 102,432 miles (9,021 surfaced). Registered *motor vehicles* numbered 701,144 in July 1959, including 489,260 passenger cars. There were (1958) 6 *railroads* operating 5,762.44 line miles, and (1959) 5 regularly scheduled *airlines* and 254 *airports and airfields* (85 commercial and municipal, 2 military, 29 private, and 138 other).

Communications media (1959) included 33 AM and 3 FM *radio stations;* 7 VHF *television stations;* 22 daily *newspapers* (circulation, 478,606) and 237 other newspapers (371,189); and (January 1) 134,600 business and 402,500 residential *telephones.*

Principal Events, 1959.—The 69th session of the unicameral state legislature met for a record-breaking 120 days in 1959. Considerable time was spent early in the session in working out rules and procedures for a recount of the votes cast for governor in 1958. Victor E. Anderson, Republican, had contested the election by 1,640 votes of Ralph G. Brooks, Democrat. Before the recount was com-

pleted, however, Anderson conceded the election to his opponent.

The legislature set the budget for the biennium at $351,854,965.85, or about $10 million above that of the previous biennium. Among the measures passed during the session were laws outlawing the secondary boycott, legalizing the playing of bingo by nonprofit organizations, imposing a tax on parimutuel betting, redesignating soil conservation districts as soil and water conservation districts and enlarging their powers, and establishing an Oil and Gas Conservation Commission.

Much attention was given to the problem of highway safety: one measure set the speed limit on county dirt and gravel roads at 50 miles per hour, and another authorized the presumption that any licensed motor vehicle operator using public highways has consented to blood and urine tests for alcohol. A concerted effort was made by the State Safety Patrol to reduce highway fatalities, and no lives were lost on Nebraska highways over the Memorial Day and Thanksgiving weekends. In the first 11 months of the year there were 305 highway deaths in the state, as compared with 320 in the same period of 1958.

Precipitation during the first 10 months of 1959 was generally above normal in the corn-growing areas. The rainfall, combined with cool weather in July, favored corn pollination and resulted in an estimated crop of 350.9 million bushels (average production for 1948–57 was about 204.9 million bushels). Sorghum grain production was estimated at 59.4 million bushels, the third largest crop in the state's history, but the winter wheat crop of 69.7 million bushels was about 6 million bushels below the 1948–57 average. Acreage under irrigation increased by about 100,000 acres, to 2,700,000 acres.

Work on the interstate highway was continued, and construction was begun on guided missile bases in the Omaha-Lincoln area. The outstanding sports event of the year was the 25–21 football victory of the University of Nebraska over the University of Oklahoma on October 31.

Principal Events by: DONALD F. DANKER, *Archivist, Nebraska State Historical Society.*

NECROLOGY, 1959. A selected list of prominent persons who died in 1959 may be found at the back of this volume, immediately following the Z articles. Separate biographies of the most prominent persons appear under their own headings throughout the volume; and the names of those who have been given more expansive treatment in the *Necrology* listing appear in the Index at the end of the volume.

NEGROES, American. The courts and legislatures won headline treatment in the press coverage of racial developments in the United States during 1959, with congressional news generally of the negative type. However, there were many nongovernmental developments of great importance that received scant, if any, space in the nation's press.

The tug of war on public school desegregation continued between the federal courts and Southern state governments. Virginia gave ground in its "massive resistance" program against school integration by making it possible for local communities to admit Negro children to previously all-white schools. However, Prince Edward County chose to discontinue its public school system entirely, with 1,090 white children being cared for in inadequate private schools and about 1,700 Negro children being deprived of any school facilities whatsoever. (See also VIRGINIA.)

Voters in Little Rock, Ark., in a dispute over the attempted firing of 44 teachers by three stanch segregationists on the local school board, voted in a recall election on May 25 to oust the three segregationists, who were supported by Governor Faubus, and to retain the three "moderate"-minded board members. The governor offered only token resistance to an extension of desegregation in Little Rock schools, and the local police quickly disposed of a badly organized mob demonstration when Negro children enrolled at a second, previously all-white high school. (See also ARKANSAS.) Florida's Governor Collins promised strong action to prevent mob action in defiance of any school desegregation in that state as the 1959–60 school year began. (See also FLORIDA.)

WIDE WORLD

Secretary of State Herter (right) congratulates John Howard Morrow after the Negro educator was sworn in on June 22 as the first U.S. ambassador to the new state of Guinea.

In Washington, D.C., the federal Civil Rights Commission won from Congress continuance of its powers for another two years, but not until after its first report had been prematurely "leaked" to the Southern press and its recommendations bitterly criticized by its opponents. Most controversial of its recommendations was a proposal that the president be authorized to appoint temporary federal registrars in those Southern communities where voting officials deprive Negro applicants of their right to register and vote. Virginia's former governor John S. Battle opposed the recommendation as a member of the commission and subsequently resigned his post, following approval by the Congress on Sept. 15, 1959, of the commission's continuance. Meanwhile, Congress shelved any additional action on civil rights legislation until 1960.

Sharp point to the commission's proposal was provided in a study published by the Southern Regional Council which showed that repressive tactics in eight Southern states had reduced Negro voter registration from 1,074,672 in 1956 to 1,028,827 in 1958—a loss of 45,845. Without freer political action by Southern Negroes, any legislative or judicial gains would be limited and insecure.

When Mack C. Parker, a Negro, was lynched in Poplarville, Miss., in April 1959, it was the first recorded lynching in four years. Efforts by the Federal Bureau of Investigation to obtain evidence to show a federal crime were thwarted by local opposition; such evidence as was gathered was turned over to a local grand jury, which adjourned on November 3 without taking action. However, the federal Department of Justice announced on the same day that it would convene a federal grand jury to consider the evidence. In Florida, four white men convicted of rape of a woman student at the all-Negro state college at Tallahassee were given prison sentences instead of death sentences. Concurrently, three Florida Negroes

awaiting execution for similar crimes against whites had their death sentences commuted.

In Bessemer, Ala., after Asbury Howard, Sr., a Negro civic leader and union official, had a poster made showing a Negro praying for help in his struggle for human rights, he was sentenced to six months on a chain gang, and the white sign painter who worked on the poster was sentenced to six months in the city jail. When Howard was attacked by a gang of white men inside City Hall and his son came to his rescue, the latter was convicted of "disorderly conduct" and given a one-year sentence.

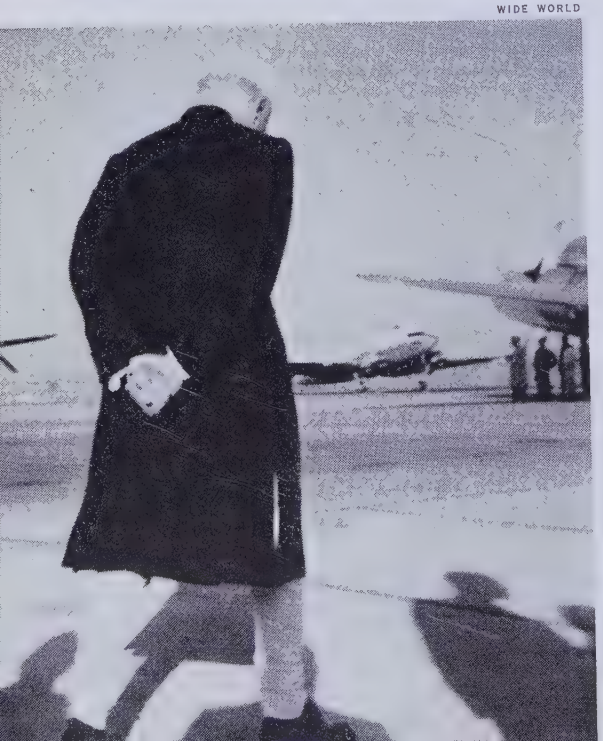
Sporadic bombings of Negro homes continued in a few Northern as well as Southern cities, being aimed in the first instance against Negroes who had purchased homes in previously all-white neighborhoods and in the second instance against those who had been active in the movement to obtain voting rights for Negroes.

Studies of urban migration, principally from rural areas of the South, showed that Negro migration was strongest to the nation's 14 metropolitan areas with populations of more than one million. Nothing happened in 1959 to reverse the ten-year trend during which the total population of these 14 areas increased by 19% while the Negro increase was more than four times as great. Although the better jobs and higher income available in urban areas accentuated the steady development of a true Negro middle class, the tremendous congestion of growing Negro populations in large cities, along with other factors, encouraged the growth of severe social problems such as crime, delinquency, and family disorganization.

Housing problems gave rise to legislative approaches aimed at their solution in Northern states. Four states (Colorado, Massachusetts, Connecticut, and Oregon) passed laws in 1959 forbidding racial discrimination in the sale or leasing of private housing. California passed a similar bill covering publicly assisted housing. Fair employment practice laws were adopted in California and Ohio.

India's Prime Minister Nehru strikes a meditative pose as he walks across airfield near New Delhi. Foremost of his problems was India's border dispute with Communist China.

WIDE WORLD



Racial policies of labor unions were examined at the AFL-CIO convention in San Francisco in September 1959. A strong resolution was passed against the continuance of any racial bar by an international union and against racial segregation in union locals. In contrast, the American Legion's fun and honor society, the Forty and Eight, had voted a few weeks earlier to retain its 40-year ban against Negro memberships. In October, however, the American Legion's Executive Committee voted to authorize the national commander, Martin B. McKneally, to take "any and all measures he may deem necessary" to eliminate the discriminatory ban in the Forty and Eight.

The appointment in 1959 by President Eisenhower of Dr. John Howard Morrow, chairman of the Department of Languages at North Carolina College, as ambassador to the new Republic of Guinea had been preceded in 1958 by the naming of Clifton R. Wharton of Baltimore as minister to Rumania—both appointments exemplifying the State Department's new policy of encouraging more qualified Negroes to enter the Foreign Service.

LESTER B. GRANGER,
Executive Director, National Urban League.

NEHRU, Jawaharlal, prime minister of India: b. Allahabad, United Provinces, India, Nov. 14, 1889. A political leader of India since his youth, Jawaharlal Nehru became prime minister and minister of external affairs in 1947. Since then he has been Asia's chief exponent of nonalignment with either East or West—a policy that was sorely tried in 1959 when Communist Chinese troops attacked Indian outposts in the disputed border regions between the two countries.

Nehru's concern with Communist Chinese imperialism began early in the year. In March, in connection with the Chinese suppression of the revolt in Tibet (q.v.), Nehru expressed deep sympathy for the plight of his northern neighbor. Speaking in Parliament on March 23, he stated that though India had "no intention of interfering in the internal affairs of China" it could not remain indifferent to the fate of the Dalai Lama. (On March 31 the Dalai Lama crossed into India, where he was granted asylum.) A week later, Nehru implied that China had disregarded its promise to respect Tibetan autonomy. The Tibetan affair also caused the prime minister to speak out sharply against Indian Communists, who, he said, show "a total absence of feelings of decency and nationality."

Of even graver concern were the Chinese attacks against Indian troops in the disputed border areas of the North-East Frontier Agency and the Ladakh section of Kashmir, beginning in August and first disclosed by Nehru on August 28. Here, Nehru, who had consistently expressed his desire to pursue a policy of "peaceful coexistence" with China, was faced by mounting criticism of his neutralist policies. On November 25, speaking out more sharply than is his custom, Nehru declared that "if war is thrust upon us, we shall fight with all our strength. But I shall do my utmost to avoid war." He accused China of committing "territorial aggression" and repeatedly refused to discuss the disputed areas with China until that nation's troops evacuate "posts on the Indian side of the traditional frontier." He further promised to defend Nepal, Bhutan, and Sikkim against Chinese aggression, which, he said, "would be considered by us as aggression against India."

In the midst of the Indian-Chinese dispute,

President Eisenhower visited New Delhi for four days, beginning December 9. The visit, marking a high point in Indian-American relations, was characterized by Nehru as a "pilgrimage of peace." In their joint communiqué (December 14) the two leaders "expressed deep satisfaction at the friendly and cordial relations existing between their countries."

Nehru: A Political Biography by Michael Brecher was published in 1959.

(See also FAR EAST; INDIA.)

NELSON, Donald Marr (70), American business executive and government official: b. Hannibal, Mo., Nov. 17, 1888; d. Los Angeles, Calif., Sept. 29, 1959. As chairman of the War Production Board from the time of its creation by President Franklin D. Roosevelt in January 1942 until 1944, he had the Herculean task of mobilizing, organizing, and directing the American industrial machine in a wartime production schedule of unprecedented proportions.

To this job Nelson brought 29 years of experience with the huge merchandising firm of Sears, Roebuck and Company, to which he had gone in 1912 as a chemical engineer following graduation from the University of Missouri. At Sears he rose to vice president in charge of merchandising in 1930 and executive vice president and chairman of the company's executive committee in 1939.

Before resigning to take the WPB chairmanship in 1942, Nelson had already served for almost two years as a "dollar-a-year man" in Washington, on various defense mobilization programs. As WPB chairman he served as Roosevelt's personal representative on war production to the governments of China and the Soviet Union in 1943–44. After his resignation from the post he published *Arsenal of Democracy: The Story of American War Production* (1946), an account of his wartime experiences.

NEPAL. This Himalayan kingdom (area, 54,362 square miles; 1958 pop. est., 8,473,478) extends for 537 miles along the northern border of India. Between Nepal and Tibet, which lies to the north, a natural barrier is formed by Mt. Everest (29,028 feet) and other great Himalayan peaks. Most of the population is concentrated in a high midlands valley of 20,000 square miles, in which are located the cities of Katmandu, the capital (pop., 195,260 in 1958); Patan (135,230); and Bhatgaon (84,240). The aboriginal stock is Mongolian, admixed with Indian strains, notably of the Gurkhas. Hinduism and, in the north, Buddhism are the principal religions.

Government.—King Mahendra Bir Bikram Shah Deva (acceded March 14, 1955) promulgated his country's first constitution on Feb. 12, 1959. The constitution retains the monarchy (in which is vested command of the armed forces of about 45,000 men, including 25,000 regulars) and provides for a Parliament consisting of a Lower House of 109 members and an Upper House of 36 members. For the Upper House, 18 members are elected by the Lower House and 18 are nominated by the king. A Supreme Court has protective powers over the people's economic, political, and religious rights.

Voting in Nepal's first general elections began on February 18, but was not concluded until April 3 because of the difficulty of distributing ballots in alpine areas. Candidates for the 109 seats in the Lower House totaled 865. Out of a total electorate of 4,120,000, more than 43% went to the polls. The final results (announced May 14) showed an overwhelming victory in Parliament for the Nepali Congress, which returned 74 candidates (including one woman) to win more than two thirds of the seats. However, the party obtained only 37.2% of the total vote. The conservative Gurkha Party won 19 seats; the United Democratic Party, 5; the Communists, 4; the People's Party (Acharya faction), 2; the People's Party (Misra faction), 1; and independents, 4. Nepal's first popular government was inaugurated on July 24, with B. P. Koirala, leader of the Nepali Congress, as prime minister. He heads an 8-member cabinet. Mr. Koirala announced a program of far-reaching reform, including the abolition of tax-free estates and the redistribution of cultivable land. In foreign affairs, Nepal's policy of neutralism between East and West will be continued.

Finance and Foreign Aid.—In 1958 the exchange rate was 150 Nepalese rupees to 100 Indian rupees. The budget for 1958–59 showed revenues of NRs.43,444,000 and expenditures of NRs.58,577,000.

Nepal is currently receiving aid from the United States (Mutual Security Program grants totaled $2,226,400 in 1958), India, China, the Soviet Union, the United Kingdom, certain Commonwealth countries (under the Colombo Plan), and the United Nations. In addition, the Indian government, in close cooperation with the United States, is furnishing extensive technical assistance, notably in communications development. Under a 1959 agreement signed on April 24, the USSR was committed to furnish 30 million rubles in financial aid, along with technical assistance, including road surveying.

Education.—Nepal's literacy rate is about 9%. In 1958 there were 2,443 English schools, 243 Sanskrit and Nepali schools, 54 basic schools, and 21 degree-granting colleges. Under a contract with the University of Oregon, a teacher-training college has been established. In 1958 work began at Lalitpur, near the capital, on Nepal's first university.

Transportation.—Two short lengths of narrow-gauge railway link Nepal with India. In 1959 there were about 500 miles of motorable roads, although 900 miles of additional roads are being built with the cooperation of the United States and India. The kingdom has 8 airstrips. India Airlines connects Katmandu with New Delhi.

Economy.—The economy is nearly 95% agricultural. In the hot lowlands belt (Terai) between three- and four-million acres are cultivated in rice, tea, cotton, and tobacco. The raising of livestock and timber is also important. Industry as yet includes only two jute, one cotton, and a few rice and vegetable-oil mills. Rice, oilseeds, dairy products, timber, and medicinal herbs are exported to India, from which Nepal receives textiles and other manufactures. A limited trade is also carried on with Tibet.

Principal Events, 1959.—Chinese Communist forces were reported to be deployed in increasing numbers on the Tibetan-Nepalese border, and Sherpa tribesmen accused the Chinese of making raids on Nepalese border villages. Nepal announced that in the face of mounting Chinese pressure it would increase its border defenses. However, an improvement in relations between the two nations was in prospect after the announcement on October 28 that Communist China had agreed to negotiate with Nepal concerning the Tibetan frontier. (See also CHINA; FAR EAST.)

A United States embassy was opened during the year at Katmandu (announced August 5). On August 9, Henry E. Stebbins was appointed as ambassador (confirmed September 9). It was also announced (April 24) that the Soviet Union and Nepal would establish diplomatic relations on the ambassadorial level.

The foundation stone of the Kosi River Dam, to be built on the border of India and Nepal, was laid on April 30 by King Mahendra and Indian Prime Minister Nehru. On a later visit to Nepal in June, Nehru lauded the policy of "peaceful coexistence." However, in the communiqué issued on June 14 by the two countries' prime ministers, it was stated that "no country should be dominated by another." Informed circles took this to be a reference to the Communist Chinese subjugation of Tibet (q.v.).

DONOVAN ROWSE,
Author and Publicist.

NERVOUS SYSTEM. The general field of the neurological sciences continued to thrive in 1959 as more and more research funds were made available. Under these conditions, there is inevitable refinement of techniques, and the interests of some investigators have turned to even finer approaches —for example, the use of microelectrodes in studying the function of brain cells by small electrodes which record from a single or only a few cells. Studies of this type are showing the functions not only of the individual cells, but even of parts of the cell and its processes, and this brings more knowl-

edge regarding the way in which the brain responds with finely graded responses to the stimuli that come to it. The developments in electromicroscopy, cytochemistry, and tissue culture indicate that substances may even enter and leave the cell without ever entering the protoplasmic matrix.

The use of permanently implanted electrodes in animals by H. W. Magoun and other investigators continues to reveal the role between the cells of the cerebral cortex and those of the brain stem, particularly those in the reticular substance. These studies have brought a better understanding of disease states with impaired consciousness, of anesthesia, and of the effect of drugs such as the tranquilizers. Neurophysiologists are using this technique to study the conditional reflex of the Pavlovian school.

Neuropathology has been for many years in a state of relative status quo. The parameters have been reasonably well defined, but newer staining techniques have brought about an arousal of interest in this area. This has been due to the cross-fertilizations between neuropathology and neurochemistry, the realization that the staining techniques used in neuropathology are chemical, and the extrapolation of new techniques from the studies of the biochemist. This area is now experiencing the same kind of vigorous growth that is encompassing neurochemistry, and the exact directions and results of this growth cannot be predicted at the present time.

On the clinical side, neurosurgical experiences in the treatment of Parkinsonism have not continued as successfully as was at first hoped. An innovation in the technique of the operation is the use of ultrasound to destroy the substantia nigra, which is a part of the basal ganglia. It is too soon to evaluate critically and finally these procedures. This is also true of aneurysms, which are still under critical survey in a collaborative project by numerous investigators under the auspices of the National Institute of Neurological Diseases and Blindness.

There has been more interest on the part of neurosurgeons recently in the treatment of cerebral vascular disease, particularly that involving the internal carotid artery. Dr. Earl Walker has introduced a technique of recording electrical activity by passing fine wires through tiny holes in the skull so that the recording from deeper structures in the brain is possible without a large major surgical procedure. Much information on the nature and spread of the seizure discharges can be obtained in this way.

In clinical neurology the refinements of diagnostic testing are continuing, as is indicated by studies on the use of sound localization as a method of determining presence of temporal lobe lesions. These studies are now being carried out to determine their validity in children and whether they may give an early indication of brain damage.

Clinical neurochemistry continues to be an attractive field of investigation, and there are numerous studies on amino acids and on enzymes in spinal fluid in various diseases. These show promise of aiding in accurate clinical diagnosis. There is a continuing interest in maple sugar disease, a peculiar disease of metabolic disorder in children leading to death, and in which the urine has a peculiar maple sugar odor. The search for newer drugs in the treatment of Parkinsonism and in epilepsy continues. A number of new preparations in the Parkinson field which have become available include Orphenodrine and Akinotone, both of which are valuable adjuvants but, like other preceding drugs, do not solve the problem. Elipten shows some considerable promise as an adjuvant drug, but it will probably not supplant any of the preparations now in use. No major new anticonvulsant drug evolved in 1959.

FRANCIS M. FORSTER,
Chairman, Department of Neurology, The University of Wisconsin.

NETHERLANDS, The, or **HOLLAND.** This constitutional monarchy of northwestern Europe is bounded by Germany, Belgium, and the North Sea. Land area, 12,529 square miles; population (est. July 1, 1959), 11,346,153. About one quarter of the total area lies below sea level and is protected by some 1,500 miles of dikes. Principal cities and populations (est. Jan. 1, 1958) are: Amsterdam, the constitutional capital, 871,577; Rotterdam, 726,188; The Hague, seat of government, 605,751; Utrecht, 249,324; and Haarlem, 167,950.

Government.—The hereditary constitutional monarch is Queen Juliana of Orange and Nassau (b. 1909; acceded 1948). The bicameral Parliament, or States-General, has a First Chamber, or upper house, with 75 members elected by the provincial councils for a six-year term; and a Second Chamber, or lower house, which is the more important legislative body, with 150 members elected every four years (or after dissolution of Parliament by the sovereign) by proportional representation. The franchise is held by subjects over 23 years of age. Following the general elections of March 12, 1959, party alignment in the Second Chamber was as follows (with seating prior to the elections in parentheses): Catholic People's, 49 (49); Labor, 48 (50); Liberal, 19 (13); Anti-Revolutionary, 14 (13); Christian Historical Union, 12 (13); Political Reform, 3 (3); Communist, 3 (7); and Pacifist Socialist, 2 (0). Premier Jan Eduard de Quay (Catholic People's) heads a coalition cabinet sworn in on May 19, 1959 (see below, *Principal Events*).

Under the Statute of the Realm (effective on Dec. 29, 1954), the Netherlands, Surinam, and the Netherlands Antilles are constituted a single realm under the House of Orange. The three states have autonomy in domestic affairs, with defense and foreign relations the concern of the realm as a whole. Realm affairs are administered by a Council of the Realm consisting of ministers appointed by the Netherlands crown and ministers plenipotentiary appointed by the former colonies.

Education and Religion.—Illiteracy is virtually nonexistent in the Netherlands. In the 1957–58 school year, there were 3,942 infant schools (with 361,936 pupils); 7,832 primary schools (1,519,952 pupils), 1,618 secondary schools (351,188); and 11 universities (32,385). There are also many technical, vocational, teacher-training, and special schools. Private religious schools play a dominant role on the preprimary and primary levels. About 45% of the population is Protestant, and 38% is Roman Catholic. Most Protestants are members of the Dutch Reformed Church.

Finance.—Revised estimates for the 1958 budget are: expenditure, 8,190 million guilders; revenue, 7,357 million. The guilder equals U.S.$0.263. Defense expenditure in 1958 was estimated at 1,686 million guilders. At the end of 1958 the total national debt was 18,591 million guilders.

Transportation and Communications.—At the end of 1958 the state-owned railway system totaled 1,936 miles, of which 50% was electrified. State and other classified roads aggregated 8,483 miles in 1954, and unclassified roads, 15,400 miles (1950). Navigable rivers and canals, comprising Holland's vital inland waterway system, totaled 4,201 miles in 1957. As of Jan. 1, 1959, the Dutch merchant fleet comprised 1,578 vessels, aggregating 4,545,524 gross registered tons. K.L.M., the Dutch national airline, in 1958 operated air routes totaling 168,000 miles and linking 105 cities in 74 countries. As of Jan. 1, 1959, radio receivers numbered 2,489,642, and registered television sets, 391,036. In 1957 there were 375,676 passenger cars; 1,318,269 telephones; and 68 daily newspapers with a combined circulation of nearly 3 million.

Production.—For the Netherlands economy the year 1958 was one of recovery from the general recession begun in late 1957. Gross national product at market prices in 1958 was estimated at 35.91 billion guilders, a real gain of 1% over 1957 (after allowing for price increases). At the end of 1958, there were 11,256 industrial enterprises employing 994,900 workers. Largest industrial sectors are the chemical, metallurgical, and foodstuffs industries. The index of industrial production (1953 = 100) averaged 126 in 1958, the same as in 1957;

it increased from 130 in June 1958 to 146 in June 1959. Production of crude steel in 1958 was estimated at 1,437,600 metric tons (up 21.2% over 1957); crude petroleum, 1,620,000 (up 6.5%); coal, 11,879,963 (up 4.4%); and tin metal, 17,400 (down 41.5%). Electricity output in 1958 totaled 13,854 million kw.-hr., an increase of 3.6% over 1957. The Netherlands, which ranks sixth among the shipbuilding countries (excluding the USSR and China), delivered 162 vessels totaling a record 550,640 gross registered tons in 1958. The important tourist industry registered 2,868,183 nights spent by foreigners in Dutch hotels during 1958 (up 7% over 1957).

Agriculture employs about 12% of the labor force and accounts for about 12% of the gross national product. Output of cereal crops in 1958 totaled 1,731,000 metric tons, down about 2% from the bumper crop in 1957. Sugar production in 1958 was estimated at a record 500,000 metric tons, up 10% over 1957, due chiefly to an increase in area under sugar beet cultivation. Main crops and 1958 yields (in thousands of metric tons) were: wheat, 402.4; oats, 445.9; rye, 427.5; barley, 315.3; potatoes, 3,664; sugar beets, 3,878; mangolds, 3,827.9; and seed onions, 234.4. The Netherlands is one of the world's largest exporters of dairy products. Production of milk in 1958 totaled 6,242,000 metric tons; butter, 91,300; and cheese, 186,000.

Foreign Trade.—The value of Dutch exports in 1958 was 12,226 million guilders (up about 4% over 1957); imports, 13,774 million (down 12%). Principal categories of exported products in 1958 (in order of value) were dairy produce, eggs, and honey; chemical products; yarns, fabrics, and textiles (excepting clothing and footwear); electrical machinery and apparatus; and base metals. Chief imports (in order of value) were mineral fuels and lubricants; base metals; machinery (excepting electrical); transport equipment; chemical products; and other manufactures, foodstuffs, and raw materials. West Germany received an estimated 19% of total Dutch exports in 1958; Belgium-Luxembourg, 15%; and Great Britain, 12%. West Germany supplied about 19.5% of Holland's 1958 imports; Belgium-Luxembourg, 18%; and the United States, 11.2%.

Principal Events, 1959.—General elections held on March 12 resulted in a narrow victory for the Catholic People's Party, which received 1,895,222 votes to Labor's 1,821,677, and secured 49 seats to Labor's 48 in the Second Chamber. The greatest electoral gains were registered by the Liberal Party, which received 732,952 votes—about 230,000 more than in 1956. The Communists suffered the greatest reverses, polling nearly 100,000 fewer votes than in 1956 and losing four seats. A new political group, the Pacifist Socialist Party, received 110,174 votes and two seats in the Second Chamber.

A new coalition cabinet headed by Premier Jan Eduard de Quay of the Catholic People's Party was installed on May 19, after protracted discussions among political leaders. Party composition of the cabinet was as follows: Catholic People's, 6 members; Liberal, 3; Anti-Revolutionary, 2; and Christian Historical Union, 2. The Labor Party was not represented in the government for the first time since World War II.

The new government effected a reduction in the annual budget deficit by abolishing state subsidies for milk and reducing by 15% subsidies for housing construction. It also approved a general increase of 20% on rents, and a 2.5% increase in controlled wages and pensions, effective as of Jan. 1, 1960.

WIDE WORLD

Princess Beatrix of the Netherlands and Gov. Nelson Rockefeller examine a statue from Netherlands New Guinea, at New York City's Museum of Primitive Art on September 15.

In a note to the Indonesian government made public on March 4, the Netherlands protested against what it called "massive violation of the rights of Dutch subjects in Indonesia." The note declared that the Indonesian law nationalizing Dutch businesses in Indonesia (promulgated in December 1958) was not valid. Earlier, Indonesia had announced that the marketing of Indonesian tea and coffee would be shifted from the Netherlands to Belgium and West Germany, respectively. (See also INDONESIA.)

Holland and Norway negotiated a new agreement providing for further cooperation in the field of atomic energy. The agreement, signed on January 27 at the Dutch reactor center under construction at Petten, includes provisions for joint experiments and research, and for exchanges of information.

Princess Beatrix, heiress-presumptive to the Netherlands throne, visited the United States on September 11–21 to help celebrate the 350th anniversary of the landing in America made by the Dutch navigator, Henry Hudson. The princess arrived in New York Harbor on the new liner *Rotterdam*, which made its maiden voyage as the flagship of the Holland-American Line.

In 1959 the Dutch economy continued its recovery from the business recession of 1957–58, as nearly all sectors reported increased activity. Unemployment declined from 116,371 at the end of 1958 to 52,950 by mid-1959. Early in the year the Van Doorne Automobielfabriek at Eindhoven began production of automobiles, with its output goal of 200 cars per 8-hour day expected to be reached by early 1960.

W. R. F.

NETHERLANDS ANTILLES. An autonomous territory under the Netherlands crown, comprising two groups of islands in the Caribbean Sea. Area, 371 square miles; pop. (Dec. 31, 1957), 190,916, chiefly Negroes and persons of mixed descent. Dutch is the official language, although a popular tongue called Papiamento is widely used. Willemstad (est. 46,000), on Curaçao, is the capital.

The three larger islands—Curaçao (172 sq.mi.; pop., 124,340), Aruba (69 sq.mi.; pop., 57,213), and Bonaire (95 sq.mi.; pop., 5,663)—lie off the coast of Venezuela. The three smaller islands—St.

Martin (of which the northern part is French), St. Eustatius, and Saba—are east of Puerto Rico.

Government.—The Netherlands Antilles has internal autonomy, with defense and foreign relations decided by the Netherlands Council of the Realm. A Dutch governor represents the crown in the Antilles. An executive council or council of ministers is responsible to the Staten or Legislative Council, whose 22 members are popularly elected for a 4-year term. Prime Minister E. Jonckheer heads a coalition cabinet led by the Democratic Party.

Education and Religion.—In 1956 the territory had 108 public and private elementary schools (35,522 pupils), 3 secondary (611), 4 technical (799), and a few teacher-training and special schools. The population is predominantly Roman Catholic.

Finance.—The estimate for the central budget for 1958 was: revenue, 50,280,000 Netherlands Antilles guilders; expenditure, 50,156,000. The NA guilder equals U.S.$0.53. In early 1959 the Netherlands granted the Antilles a loan equivalent to $10 million to help meet debts incurred in the financing of development projects in Curaçao and Aruba.

Transportation and Communications.—The territory has no railways. Surfaced roads total about 475 miles. Hato Air Field on Curaçao is a Caribbean air terminal of some importance. Motor vehicles numbered 20,460 in 1958; telephones, 10,706.

Economy.—The petroleum refining industry dominates the economy. Two large refineries on Aruba and one on Curaçao refine crude oil obtained from nearby Venezuela. Output of petroleum products in 1957 totaled 38,381,000 metric tons (down 3% from 1956), including 22,835,000 of residual fuel oil, 4,736,000 of distillate fuel oils, and 3,801,000 of gasoline. Production of phosphatic guano on Curaçao amounted to 92,800 metric tons in 1957. Aloes, sorghum, beans, corn, and tropical fruits are grown, and there is some fishing, but the territory depends on imports for most foodstuffs. Tourism provides an additional source of income. Exports in 1958 totaled 1,525 million Netherlands Antilles guilders; imports, 1,693 million. Petroleum products constitute nearly all of the exports, and crude oil comprises the bulk of imports.

NETHERLANDS EAST INDIES. See INDONESIA.

NETHERLANDS GUIANA. See SURINAM.

NETHERLANDS NEW GUINEA. The western half of the island of New Guinea in the southwestern Pacific, including the Schouten Islands, Japen, Noemfoor, and other nearby islands. (The territory is also termed Western New Guinea, and, by the Indonesians, West Irian or Irian Barat.) Area, 159,375 square miles; pop. (est. 1958), 700,000, including about 14,000 Europeans (mainly Dutch) and 16,000 nonindigenous Asians. The natives are Papuan, Negrito, and Melanesian tribesmen. Hollandia (15,153) is the capital.

Government.—The territory is ruled by a Dutch governor (Pieter J. Platteel) aided by a council of the heads of administrative services. In some areas there are native advisory councils which cooperate with administrators. About half the population has been brought under administrative control; the remainder consists of isolated primitive tribes, many of which have had no contact with whites. In 1958, expenditure totaled 133 million guilders, or 65.9 million in excess of revenue; the deficit was made up by the Netherlands government.

Education and Religion.—In 1956 there were 1,033 primary schools (45,647 pupils), 5 secondary (409), 14 technical (570), and 6 teacher-training (368). Fewer than a third of the natives have been converted to Christianity.

Economy.—The natives grow coconuts, yams, taro, bananas, sago, and other food crops. There is also some stock raising and fishing. Oil deposits yielded 331,725 metric tons of petroleum in 1957. In 1959, concessions were granted to three Dutch firms and an American firm to mine the nickel and cobalt deposits on Waigeu Island and in the Cyclops Mountains area. Exports in 1958 totaled 24.2 million guilders; imports, 85.9 million. Chief exports were petroleum (267,000 metric tons, valued at 16.3 million guilders), copra, copal, nutmeg, mace, and crocodile skins.

Principal Events, 1959.—Sovereignty over Western New Guinea has been in dispute between the Netherlands and Indonesia since 1949. In 1957 Indonesia began a campaign of economic pressure against Dutch interests in Indonesia, and in 1959 continued to press demands for the territory. Following Indonesian Foreign Minister Subandrio's visit to Australia (which administers the eastern part of New Guinea), a joint Indonesian-Australian communiqué was issued on Feb. 15, 1959, in which Australia agreed to recognize any Netherlands-Indonesian agreement on Western New Guinea. Pending such an agreement, however, Australia continued to recognize Netherlands sovereignty. On August 17, Indonesian President Sukarno warned of further economic measures against the Dutch, but declared on December 6 that Indonesia would not resort to force to obtain the territory.

NETHERLANDS WEST INDIES. *See* NETHERLANDS ANTILLES.

NEUROLOGY. See NERVOUS SYSTEM.

NEVADA. Western state, United States; admitted to the Union, Oct. 31, 1864. The "Silver State" ranks 7th in area and 49th in population among the 50 states.

Area and Population.—Area: 110,540 square miles (land, 109,789; inland water, 751), divided into 17 counties. Population: (1950) 160,083; (est., July 1, 1958) 272,000. Populations of the state capital and of urban places with more than 4,000 inhabitants in 1950 (unless another date is given) are: Carson City, *the capital*, 3,082; Elko, 5,393; Las Vegas (special census, 1955), 44,795; North Las Vegas (special census, 1956), 12,902; Reno, 32,497; and Sparks, 8,203.

Executive.—Chief state officers in 1959:
Governor: Grant Sawyer (Democrat)
Lieutenant Governor: Rex Bell
Secretary of State: John Koontz
Treasurer: Dan W. Franks
Attorney General: Roger D. Foley
Supt. of Public Instruction: Byron Stetler

Constitution and Judiciary.—The present constitution went into effect in 1864. The Supreme Court comprises three justices; chief justice in September 1959 was Charles M. Merrill.

Legislature.—The Nevada Legislature comprises a 17-member Senate (in 1959, 10 Republicans and 7 Democrats) and a 47-member Assembly (33 Democrats and 14 Republicans), which meet commencing the third Monday in January.

The 1959 session approved 1959–60 fiscal year appropriation increases for education and new capital construction, authorizing funds from the $15 million surplus in the General Fund and from a $2.7 million balance in the distribution school fund. No new taxation was required. Special appropriations included $50,000 for a study of local and state fiscal affairs; $555,000 for a combined classroom and physical education building at the University of Nevada's Las Vegas campus and $2,572,912 for a library building at the Reno campus; $200,000 for the 1960 Winter Olympic Games Commission; $739,615 for property acquisition for the state capital complex development; and $20,000 for a study of financial and administrative problems in the public schools. School support was increased to $11 million.

Other legislation created a state Gambling Commission and a Colorado River Boundary Commission; ratified the Western Interstate Higher Education and the Western Interstate Corrections compacts; transferred regulation of foods and drugs and of weights and measures from the University of Nevada to the Department of Health and the Board of Stock Commissioners, respectively; established a Desert Research Institute at the University of Nevada; enacted an Installment Loan and Financing Act; stiffened penalties for selling narcotics; and extended real estate licensing coverage.

Finance.—In the 1958–59 fiscal year, state revenue of $86,422,952.03 comprised $21,201,255.12 from the federal government and $65,221,696.91 from state tax and other sources. Tax revenue included $11,057,369.49 from a 2% general sales tax, $9,060,249.41 from motor fuel taxes, and $3,887,162.20 from licensing. Expenditures of $86,779,645.71 consisted of $13,927,155.53 for education, $6,523,445.70 for health, welfare, and safety, $25,878,643.07 for highways, and $40,450,401.41 for other purposes. Long-term indebtedness on June 30, 1959, amounted to $2,856,000.

Banking.—As of June 10, 1959, the state's 3 national banks had $298,129,000 in assets, $168,422,000 in demand deposits, and $108,665,000 in time deposits. The 3 state banks had assets of $125,946,782.90, demand deposits of $51,262,871.70, and time deposits of $42,339,920.20

Education.—School attendance is compulsory between the ages of 7 and 17, inclusive. Operating

expenditures for public elementary and secondary education in the 1958–59 fiscal year totaled $19,677,541.15 ($379.55 per pupil), and revenue comprised $8,707,311.96 from local school districts, $10,318,902.58 from the state, and $665,385.78 from the federal government. Outlays for construction and improvements amounted to $644,109.85, and teachers' salaries averaged $5,314 (high school, $5,333; elementary, $5,042).

In the 1958–59 school year there were 167 public elementary schools with 1,466 teachers and 49,073 pupils, and 45 junior and senior high schools with a combined teaching staff of 780 and enrollment of 20,019. The state's 16 private and parochial elementary and secondary schools enrolled 3,442 pupils. College and university enrollment totaled 3,354.

Public Assistance.—In the 1958–59 fiscal year public assistance expenditures from federal and state funds (excluding institutional costs) included $2,135,500 for the aged, $1,036,671 for dependent children, and $194,793 for the needy blind. A monthly average of 5,959 persons received assistance.

Labor Force.—The state's labor force totaled 111,200 persons on June 15, 1959, including 7,600 agricultural workers. Nonagricultural employment was up to 100,800, compared with 92,250 for the previous June 15 and also above the 94,850 average for the 12 intervening months. Of nonfarm employees in 1959, 28.8% were engaged in service industries, 19.74% in wholesale and retail trade, and 17.76% in government. Unemployment was down to 2,800 on June 15, 1959, from 5,350 a year earlier. The state paid $7,785,588 in unemployment compensation during the year ending June 30, 1959.

Manufacturing.—The state's 208 manufacturing plants in 1958 employed an average of 4,990 persons. Wages earned (1957) amounted to $24,134,000, and value added by manufacture totaled $92,172,000. Outlays for new plant and equipment were $8,752,000. Production workers averaged $108.62 for an average workweek of 41.3 hours in August 1959.

MAJOR NEVADA MANUFACTURES, 1957

Product or industry	No. of employees[1]	Salaries and wages	Est. value added by mfr.[2]
Chemicals and products	1,849	$11,163,638	$52,582,000
Iron and steel products	1,007	5,230,876	12,502,000
Printing and publishing	740	3,352,234	9,922,000
Food and kindred products	540	2,545,617	9,064,000
Stone, clay, glass products	357	2,081,606	5,309,000
Lumber and wood products	498	2,361,999	4,700,000

[1] Average per year. [2] For definition see footnote 1 in article *Industrial Production.* (Source: Business and Industry Department, Reno Chamber of Commerce.)

Mining.—In 1958 Nevada ranked 32d among the states in the value of its mineral output, with 0.41% of the national total. The state was the sole producer of brucite in 1958 and was first in manganese output; second in antimony, diatomite, mercury (19% of domestic output), and perlite; fourth in barite and copper; and fifth in silver.

NEVADA MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Barite	59,407	$ 405,000
Copper	66,137	34,788,000
Fluorspar	12,338	340,000
Gold (ounces)	105,087	3,678,000
Gypsum	686,000	2,306,000
Iron ore, Usable (long tons)	594,000	3,149,000
Lead	4,150	971,000
Manganese ore	127,322	7,566,000
Mercury (76-pound flasks)	7,336	1,681,000
Sand and gravel	5,503,000	5,311,000
Silver (ounces)	933,000	844,000
Stone	813,000	1,335,000
Other minerals	...	6,257,000
Total	...	$68,293,000*

* Total adjusted to avoid duplication in the value of raw materials used in manufacturing cement or lime. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1959 totaled $35,250,000 compared with $34,986,000 for the corresponding period of 1958. For the full year 1958, income comprised $46,372,000 from livestock and livestock products (including $35,357,000 from cattle), $6,286,000 from crops, and $640,000 from government payments.

NEVADA CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Barley (1,000 bu.)	713	720	720
Hay (1,000 tons)	609	645	472
Oats (1,000 bu.)	241	160	132
Potatoes (1,000 cwt.)	297*	352	260
Wheat (1,000 bu.)	473	754	756

* Average, 1949–57. (Source: U.S. Department of Agriculture.)

There were 3,000 farms in the state in 1958. Total acreage (1954) of 8,231,000 included 360,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 597,000 cattle and 405,000 sheep. There were 7,086 family and hired workers engaged in farming during the week of Sept. 26–Oct. 2, 1954.

Transportation and Communications.—State and federal funds spent for highways in the 1958–59 fiscal year totaled $24,319,856.68, and 278.8 miles of new construction were completed.

Highways and roads on June 30, 1959, totaled 44,290.6 miles (4,356.9 surfaced). Registered *motor vehicles* numbered 165,293 on the same date, including 115,609 passenger cars. There were (1958) 4 *railroads* operating 1,765.13 main line miles, 5 regularly scheduled *airlines,* and 50 public-use *airports and airfields.*

Communications media (1958) included 1 FM and 17 AM *radio stations;* 4 VHF *television stations;* 8 daily *newspapers* (circulation 73,457) and 23 other newspapers; and (Jan. 1, 1959) 54,700 business and 47,400 residential *telephones.*

Principal Events, 1959.—In the spring legislative session, Gov. Grant Sawyer set a "get tough" policy toward legal licensing of gambling in Nevada. He asked for a new law for stricter control, intended to prevent "hidden interests" in the casinos, or secret ownership by ex-convicts or racketeers. At a considerable political risk, he made this a major issue and won passage of the law by a small margin. In his first year in office the governor appointed two new state Supreme Court justices. Ordinarily the court's three justices are elected; however, this year two vacancies occurred when one justice retired and when Chief Justice Charles Merrill was named to the U.S. Circuit Court in San Francisco by President Eisenhower.

Near Ely, in the eastern part of the state, an effort is being made to expand Lehman Caves National Monument and Wheeler Peak into a 146,000-acre Great Basin national park. The caves have crystal stalactite formations comparable to any in the country, and Wheeler Peak (over 13,000 feet), the second highest mountain in Nevada, has the state's only living glacier. Creating a national park, however, would cancel local rights, which has raised some opposition from fish and game sportsmen, mining interests, and sheep and cattle livestock organizations.

The main highways between Reno and the site of the 1960 Winter Olympics, at Squaw Valley, Calif., near Lake Tahoe, have been widened to four lanes in major part. These roads include both U.S. 40 via Truckee and U.S. 50 via Carson City.

The University of Nevada campus at Reno and that of its Nevada Southern Branch at Las Vagas

both had major construction projects under way during the year. (See also above, *Legislature.*)

Las Vegas has built a $5 million convention hall and municipal auditorium, but it has been little used, partly because of boycotts by large casino-hotels which have their own convention facilities. Meanwhile, Reno has rushed through its plans for a similar auditorium, approving a $4.5 million bond issue.

Principal Events by: AUSTIN E. HUTCHESON, *Professor of History, University of Nevada.*

NEW BRUNSWICK. One of the three Maritime provinces of Canada, New Brunswick has an area of 27,985 square miles, of which 512 square miles are water. Nearly 80% of the land area is forested, mainly by coniferous trees. The population (1956 census) is 554,616 (est. Sept. 1, 1959, 593,000), with 57% of British origin and 38% of French descent. There are some 2,200 native Indians. The urban population represents 45.8% of the total. Chief cities, with 1956 populations, are Fredericton, the capital, 18,303, Saint John, 52,491; Moncton, 36,003; Edmundston, 11,997; and Lancaster, 12,371.

Government.—New Brunswick is represented in the Canadian Parliament by 10 senators (appointed) and 10 members (elected) of the House of Commons. The crown is represented in the province by a lieutenant-governor. The provincial premier presides over a cabinet, or council of ministers, drawn from and responsible to a Legislative Assembly of 52 members who are elected for five-year terms. In 1956 the Hon. Hugh John Flemming, who in 1952 pioneered the recent trend to Conservatism in Canada, was returned as premier. The Progressive Conservative Party, which he heads in New Brunswick, held 34 seats in 1959, while the Liberal opposition had 14 seats and there were four vacancies. In the 1958 federal election New Brunswick sent 7 Progressive Conservatives and 3 Liberals to Ottawa.

Finance.—For the fiscal year ending March 31, 1959, revenues were $76,925,804, and expenditures were $76,746,721. The net debt was reduced by $985,079 to $106,426,000 (over the last eight years the province's net debt has fallen by some $10 million). The increase in revenues of $9.27 million over the previous year is largely attributable to receipt of the first Atlantic Provinces Adjustment Grant of $7.5 million from the federal treasury.

Education.—Primary and secondary education is free and compulsory for all children aged 7 to 16, inclusive. The enrollment for the year ending June 30, 1958, was 129,683, and there were 5,274 teachers. The province has 7 universities and colleges with a combined enrollment of about 3,300. Nearly half of the students attend the provincial nonsecretarian University of New Brunswick at Fredericton; a third attend Mount Allison University at Sackville (sponsored by the United Church of Canada); and the remainder are enrolled in 5 small Roman Catholic universities and colleges.

Transportation and Communications.—New Brunswick is served by both the Canadian National and Canadian Pacific railways, and by Trans-Canada and Maritime Central airlines. Saint John, the principal seaport, is ice-free and contains one of the world's largest dry docks. There is daily ferry service across the Bay of Fundy between Saint John and Digby, Nova Scotia. New Brunswick has 6 daily newspapers, 11 radio stations, and 2 television stations.

Manufacturing and Mining.—Manufacturing, New Brunswick's principal industry, employs approximately 22,000 persons. The chief manufactures are those based on the forest, sea, and farm, although shipbuilding, heating apparatus, footwear, and confectionery products are important. Manufacturing was adversely affected by the 1957–58 recession, and the gross annual value of factory shipments declined from $313.2 million in 1956 to $311.1 million in 1957, and to $304.4 million in 1958.

The province's mineral output was valued at $17 million in 1958, a decline of $6.2 million from the previous year. New Brunswick's share of national mineral production declined from 1.1% in 1957 to 0.8% in 1958. Coal accounts for about half of the province's mineral production. Great activity had been expected in the large, high-grade base-metal deposits in the northeastern section of New Brunswick, but the fall of world base-metal prices and the effects of United States trade policies brought disappointment and a slowing down in exploration and development in this field.

Power Development.—With the completion in 1957 of the first unit (of three) of the hydroelectric plant at Beechwood on the Saint John River, the province was left with a small power surplus. This is expected to disappear when base-metal prices recover and large-scale mining and smelting operations are undertaken. With this in mind, the provincial government, through the New Brunswick Electric Power Commission, began work on a 66,000-hp. thermal unit at Saint John, and purchased the Grand Falls plant from private owners with a view to redevelopment. The government plans further dams on the Saint John River, and looks forward with interest to the decision of the International Joint Commission (IJC) regarding a proposed $500 million tidal power project in Passamaquoddy Bay on the Maine–New Brunswick coast. On Oct. 16, 1959, the IJC released an engineering report which found the plan economically feasible.

Agriculture.—According to the 1956 census, farm area totaled 2,981,419 acres (a decline of 14% since 1951), and farms numbered 22,116 (a decline of 16%). Most farms are small (40–120 acres) and mixed farming is the rule. Net income from farm operations, including farm wood lots, was $48.4 million in 1956 and $43.9 million in 1957; the estimate for 1958 was $46.1 million. Livestock, pulpwood, and field crops, especially potatoes, provide the major part of farm income; but apples, small fruits, and poultry are also important. A recent development has been the establishment of food processing and freezing plants.

Forestry and Fisheries.—New Brunswick's forest industries have an annual output value of some $150 million, two thirds of which is contributed by the 8 pulp and paper mills. The provincial government has virtually eliminated the spruce budworm by means of extensive aerial spraying, and has attempted to encourage greater development and utilization of the forests.

The value of New Brunswick sea fisheries was $22.8 million in 1956, the latest year for which figures are available. Lobsters are the most valuable fish product, followed by sardines, cod, and herring. The inland salmon fishing attracts a large number of fly-fishermen from the United States.

Principal Events, 1959.—Meeting at Fredericton on September 14–15 in their annual conference, the premiers of the four Atlantic provinces (New Brunswick, Nova Scotia, Newfoundland, and Prince Edward Island) decided to engage a financial expert with a worldwide reputation to study the effects of federal credit policy on the Atlantic region.

New Brunswick was honored by the visit of Queen Elizabeth II and Prince Philip on July 28–30. The royal couple received an enthusiastic welcome from this United Empire Loyalist-founded province.

The mile-long Princess Margaret Bridge across the Saint John River at Fredericton was completed late in the year and opened to traffic.

On June 19 the fishing fleet out of Escuminac on Northumberland Strait was virtually destroyed in a storm in which 35 fishermen lost their lives. A relief fund for their families raised more than $400,000, and Queen Elizabeth paid a visit to the stricken families.

The Lord Beaverbrook Art Gallery, on the banks of the Saint John River at Fredericton, was formally opened on September 16 by the donor, a British publisher and financier who spent his boyhood in the province. The gallery, one of the finest in Canada, houses Lord Beaverbrook's $3,000,000 art collection and a few other donations, numbering some 300 paintings in all.

JAMES K. CHAPMAN,
Associate Professor of History, University of New Brunswick.

NEW CALEDONIA. A French overseas territory in the eastern South Pacific. Area (with dependencies), 8,548 square miles; pop. (Dec. 31, 1957), 72,478, including 36,668 Melanesians, 24,882 Europeans (mostly French), and a few thousand workers from Vietnam and Java. Nouméa (22,238) is the capital. The dependencies include the Loyalty Islands, Isle of Pines, Huon Islands, Chesterfield Islands, Walpole Island, Belep Islands, and the distant Wallis Islands and Futuna Islands.

The French-appointed governor is aided by a Council of Government (ministry) chosen by the Territorial Assembly. The assembly has 30 members elected for 5 years by universal suffrage. In the elections of Dec. 7, 1958, the Caledonian Union obtained 18 seats in the assembly. On Dec. 17, 1958, the assembly decided that New Caledonia

would retain its status as a French overseas territory. (Wallis and Futuna islands voted in favor of overseas territorial status on Dec. 27, 1959.) The ordinary budget for 1958 totaled 1,030 million francs CFP; the extraordinary budget, 172.5 million (the franc CFP equals 5.50 metropolitan francs). In 1957, primary schools had 13,060 pupils; secondary, 1,079; technical, 380.

Mining and metallurgy are the chief industries. Production of nickle ore totaled 591,400 metric tons in 1958 (1,799,000 in 1957); chrome ore, 47,400; iron ore, 295,000; and nickle matte, 6,422. Crops include coffee, copra, cotton, manioc, tobacco, and bananas. Cattle and other livestock are raised, and meatpacking is important. Exports in 1958 totaled 2,030 million francs CFP (down more than a third from 1957); imports, 3,438 million. Ores and metals provide the bulk of exports. Trade is mostly with France. The territory has no railways. Roads total 1,739 miles (1957). Nouméa is serviced by international steamship lines and airlines.

NEW GUINEA. This second largest island in the world (area, 342,915 square miles) lies north of Australia in the western Pacific Ocean. It comprises Netherlands New Guinea (q.v.) and two Australian-administered areas: the Territory of Papua; and North Eastern New Guinea, which is a United Nations trust territory (see PAPUA AND NEW GUINEA, TERRITORY OF). In mid-1958 the aggregate population was estimated at 2,528,000 (Papua and New Guinea, 1,828,000; Netherlands New Guinea, 700,000).

NEW HAMPSHIRE. New England state, United States; one of the original 13 states. The "Granite State" ranks 44th in area and 45th in population among the 50 states.

Area and Population.—Area: 9,304 square miles (land, 9,017; inland water, 287), divided into 10 counties. Population: (1950) 533,242; (est., July 1, 1958) 582,000. Urban places with populations above 10,000 (as estimated by the State Planning and Development Commission for 1957) are:

Berlin	18,269	Laconia	15,017
Claremont	14,484	Manchester	84,544
Concord (*capital*)	28,232	Nashua	39,989
Dover	18,667	Portsmouth	18,678
Keene	17,385	Rochester	14,643

Executive.—Chief state officers in 1959:
Governor: Wesley Powell (Republican)
Secretary of State: Harry E. Jackson
Treasurer: Alfred S. Cloues
Attorney General: Louis C. Wyman
Comptroller: Leonard S. Hill
Commissioner of Education: Charles F. Ritch, Jr.

Constitution and Judiciary.—The present constitution went into effect in 1784. The Supreme Court comprises five justices; chief justice in 1959 was Frank R. Kenison.

Legislature.—The New Hampshire General Court comprises a 24-member Senate (in 1959, 18 Republicans and 6 Democrats) and a 400-member House of Representatives (264 Republicans and 136 Democrats) which meet in odd-numbered years commencing the first Wednesday in January.

The 1959 session was notable for being the longest (110 days) and, at times, the most turbulent in the state's history. Despite a serious split in the ranks of the Republican majority and steadily worsening relations with Gov. Wesley Powell, the General Court had many accomplishments to its credit. It approved for the biennium a $47 million budget which provided for substantially higher appropriations for elementary and secondary school building construction, welfare payments to nursing homes, state promotional activities, and faculty salary increases at the University of New Hampshire. It also approved a $31 million accelerated highway program to be completed in two instead of three years, and it approved two $1 million bond issues, one authorizing the state Port Authority to launch self-liquidating projects in Portsmouth Harbor and the other calling for a multiple apartment for graduates and faculty at the state university. The legislature established a program by which the state would provide up to 20% of the cost of setting up plants for pollution abatement. It also adopted a new franchise tax on gas and electric utilities to take the place of that enacted in the 1958 special session, and it increased the tax on gasoline from 6 to 7 cents. To help finance a program to enlarge and modernize the state's airports, a fee of $1 was levied for each passenger boarding a commercial airplane in the state. Workers injured on the job or unemployed were voted higher maximum benefits, and real estate salesmen and brokers were required to be licensed. A new probationary driver's license was authorized for beginners and for drivers regaining their license after revocation. One of the legislature's first acts was to reimburse the legislator who in 1958 paid more than $23,000 for the new seats in Representatives' Hall.

The 1959 session was also notable for what the legislature did not pass. It voted down Governor Powell's proposals to combine two state commissions—Planning and Development, and Forestry and Recreation—into a single Department of Commerce; to abolish the Milk Control Board; and to eliminate the retail price-fixing of milk.

The 1956 Constitutional Convention met for three days in December 1959 to consider amendments to the state constitution. Of the 20 amendments proposed, only four were voted, and these must be approved by the voters in 1960 before they can go into effect. They would: (1) stop mileage payments to legislators after 90 days or July 1, whichever date comes first; (2) give the legislature authority to fill vacancies in the state or local governments caused by emergency attack; (3) boost from $100 to $500 the minimum amount of damage claims in civil suits for which a jury trial can be demanded; and (4) allow the legislature to delete nonresidents from the population census in computing apportionment of seats in the state House of Representatives.

Finance.—In the 1958–59 fiscal year, state revenue of $126,816,704 comprised $35,974,716 from state tax sources, $24,258,617 from the federal government, and $66,583,371 from other sources. Tax revenue consisted of $11,637,055 from motor fuel taxes, $14,791,339 from licensing, and $9,546,322 from other sources. Expenditures of $130,313,386 comprised $60,630,902 from the General Fund, $47,867,174 from the Highway Fund, $5,122,263 from the Capital Fund, and $16,693,047 from other funds. Long-term indebtedness on June 30, 1959, amounted to $71,750,000.

Banking.—As of June 10, 1959, the state's 51 national banks had $295,869,000 in assets, $203,150,000 in demand deposits, and $56,907,000 in time deposits. The 58 state banks on June 30, 1959, had assets of $698,946,091.20, time deposits of $586,895,160.40, and demand deposits of $25,513,762.39.

Education.—In school districts which include a high school, attendance is compulsory between the ages of 6 and 16, inclusive; otherwise, attendance may be terminated at 14. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $29,498,944.85 ($301.62 per pupil); an additional $50,511.03 was spent for veterans training and other adult educa-

NEW HAMPSHIRE SCHOOL STATISTICS, 1957–58

Type of school	No.	Teachers	Students
Public elementary (k-8)	408	2,454	68,090
Public junior high (7–8)	30	313	5,956
Public senior high (9–12)	81	1,192	23,432
Approved public academies (9–12)	9	83	1,616
Private and parochial elementary and secondary	121	1,117	29,940
Technical institutes	2	27	332
Junior colleges	1	46	528
Teachers colleges	2	95	1,211
Colleges and universities	9	697	8,900

New Hampshire's White Mountains were hit by heavy rains and landslides in October. Here, a police car is trapped by debris washed across the highway in Franconia Notch.

WIDE WORLD

tion programs. Revenue comprised $26,307,920.47 from local school districts, $1,921,799.08 from the state, and $1,319,736.33 from the federal government. Outlays for construction and improvements amounted to $7,087,962.76, and teachers' salaries averaged $3,956 (high school, $4,248; elementary, $3,767).

Public Assistance.—In the 1958–59 fiscal year, public assistance expenditures from federal and state funds (excluding institutional costs) totaled $9,038,428.16, including $4,690,106.86 for the aged, $1,969,243.86 for dependent children, and $1,755,728.88 for general relief. A monthly average of 14,902 persons received assistance.

Labor Force.—The state's labor force totaled 236,750 in June 1959, including 14,000 agricultural workers. Nonagricultural employment was up to 199,830 persons from 190,230 reported the previous June and also above the 190,800 average for the 12 intervening months. Major nonfarm employment categories in 1959 were manufacturing, accounting for 43.2% of the total; trade, 16.2%; and government, 15.2%. Unemployment, confined chiefly to nonfarm groups, was down to 8,200 in June 1959 from 11,850 a year earlier.

Manufacturing.—There were 80,083 persons employed in manufacturing plants in the state during 1957 whose wages totaled $285,442,000. Value added by manufacture totaled $515,082,000, and outlays for new plant and equipment amounted to $25,410,000. Production workers averaged $68.57 for an average workweek of 40.1 hours in July 1959.

MAJOR NEW HAMPSHIRE MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.* (thousands of dollars)
Leather and leather goods	20,537	$64,658	$91,608

Mining.—In 1958 New Hampshire ranked last among the states in the value of its mineral output, with 0.02% of the national total. The state was second in the production of sheet mica and third in feldspar output.

NEW HAMPSHIRE MINERAL PRODUCTION, 1958

Mineral	Quantity	Value
Clays	26,100	$ 26,000
Mica	38	616,000
Sand and gravel	4,940,000	2,620,000
Other minerals	...	615,000
Total	...	$3,877,000

(Source: U.S. Bureau of Mines and the New Hampshire State Planning and Development Commission.)

Agriculture.—Cash farm income for the first nine months of 1959 was down to $42,319,000 from $46,251,000 in the corresponding period of 1958. For the full year 1958, income comprised $53,389,000 from livestock and livestock products, $9,182,000 from crops, and $552,000 from government payments. Principal income sources in 1958 were eggs, $20,222,000, and dairy products, $19,193,000.

There were 10,100 farms in the state in 1958. Total acreage (1954) of 1,457,000 included 247,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 97,000 cattle and 2,883,000 chickens (excluding commercial broilers). There were 17,768 family and hired workers engaged in farming during the week of Sept. 26–Oct. 2, 1959.

NEW HAMPSHIRE CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	1,098	1,600	1,630
Corn (1,000 bu.)	516	539	564
Hay (1,000 tons)	350	310	295
Maple sirup (1,000 gal.)	54	54	43
Oats (1,000 bu.)	78	43	39
Potatoes (1,000 cwt.)	507*	360	340

Transportation and Communications.—State and federal funds disbursed for highways in the 1958–59 fiscal year totaled $42,550,000, and 61.4 miles of new construction were completed in 1958. (See also below, *Principal Events, 1959.*)

Highways and roads on Jan. 1, 1959, totaled 13,898 miles (7,368 surfaced). Registered *motor vehicles* (April 1, 1958—March 31, 1959) numbered 226,045, including 191,605 passenger cars. There were (1959) 7 *railroads* operating 1,186 line miles; 2 regularly scheduled *airlines;* and 29 *airports and airfields* (24 commercial and municipal, 1 military, and 4 private).

Communications media (1958) included 14 AM and 4 FM *radio stations;* (1959) 2 *television stations;* (1958) 9 daily *newspapers* and 40 other newspapers; and (Jan. 1, 1959) 52,500 business and 150,800 residential *telephones.*

Principal Events, 1959.—Politically, 1959 was a year of controversy and confusion. From early summer, Gov. Wesley Powell was embroiled with many of the old guard leaders of his own Republican Party inside and outside the legislature. It was also a year of watchful waiting and maneuvering for the rival groups supporting the presidential candidacy of Vice President Richard M. Nixon and New York's Gov. Nelson A. Rockefeller, until the latter announced on December 26 that he would not seek the nomination.

In the fall, ground was broken on two badly needed water projects—the $30 million flood control project near Hopkinton which is to be built by Army engineers under an interstate compact between Massachusetts and New Hampshire, and a $2.8 million dam and reservoir to be built on the Bellamy River in Madbury to provide water for Pease Air Force Base and the City of Portsmouth. Two new highways were opened to traffic: the 34-mile Kancamagus Highway between Conway and Lincoln through the heart of the White Mountain National Forest, and a 7-mile extension to the F. E. Everett Turnpike north of Concord.

In July, television station WENH began broadcasting at Durham; it is the only educational station serving northern New England.

Late in October the White Mountain region was lashed by a southeaster. The torrential rains which followed in its wake flooded all major routes into Pinkham, Franconia, and Crawford notches, and set off a landslide on Mount Lafayette which buried U.S. Route 3 under mounds of debris 10 to 23 feet high.

The U.S. Supreme Court affirmed, on June 8, the contempt conviction of Dr. Willard Uphaus, the operator of a summer camp in New Hampshire who had refused to produce guest lists during an investigation by the state attorney general of subversive activities (see also Civil Liberties). He was sentenced on December 14 to a year's imprisonment.

Executive.—Chief state officers in 1959:
Governor: Robert B. Meyner (Democrat)
Secretary of State: Edward J. Patten
Teasurer: John A. Kerwick
Attorney General: David D. Furman
Auditor: Frank Durand
Commissioner of Education: Frederick M. Raubinger

Constitution and Judiciary.—The present constitution went into effect in 1948. The Supreme Court comprises seven justices; chief justice in 1959 was Joseph Weintraub, appointed in 1957.

Legislature.—The New Jersey Legislature comprises a 21-member Senate (in 1959, 13 Republicans and 8 Democrats) and a 60-member House of Assembly (42 Democrats and 18 Republicans) which meet annually commencing the second Tuesday in January.

The 1959 session approved a $405,140,800 budget for the 1959–60 fiscal year, including $500,000 for a widened scholarship program and $400,000 for state library aid, and passed a supplemental appropriation of $3,915,257 to meet current and prior obligations. Other legislation increased the salaries of full-time judges in the state by $2,000; insured or guaranteed maximum yearly loans of from $1,000 to $5,000 to a student by a bank; transferred the administration of aid to dependent children from state to county jurisdiction; and set up special educational services for emotionally and socially maladjusted pupils. Life insurance companies were permitted to issue variable annuity contracts; local assessors who fail to comply with the 1959 Supreme Court mandate that real estate be levied at 100% of full value were made immune to prosecution; and the state was given control over highway advertising.

To meet increasingly complex transit and commuter problems, the legislature approved state participation in a New York–New Jersey metropolitan transit district (effective on approval of similar legislation by New York State); created a Division of Railroad Transportation in the Highway Department and appropriated $50,000 for its initial operation; and banned unauthorized rail cuts. (See also below, *Principal Events, 1959.*)

Finance.—In the 1958–59 fiscal year, state revenue of $713,824,973 comprised $461,465,855 from state tax sources, $172,464,485 from the federal government, and $79,894,633 from other sources. Tax revenue consisted of $18,698,030 from corporate income taxes, $92,467,526 from motor fuel taxes, $68,104,461 from licensing, and $282,195,838 from other state tax sources. Expenditures of $718,946,771 comprised $148,362,204 for education, $269,004,635 for health, welfare, and safety, $142,785,103 for highways, and $158,794,829 for other purposes. Long-term indebtedness on June 30, 1959, amounted to $102,521,000.

Banking.—As of June 10, 1959, the state's 165 national banks had $7,137,546,000 in assets, $2,060,685,000 in demand deposits, and $1,684,935,000 in time deposits. The state's 115 other banks had assets of $4,532,049,000, demand deposits of $1,555,421,000, and time deposits of $2,557,897,000.

Education.—School attendance is compulsory between the ages of 7 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $363,644,280.40 ($409.65 per pupil), and revenue included $270,722,625 from local school districts, $70,099,457 from the state, and $1,735,047 from the federal government. Outlays for construction and improvements amounted to $111,320,629.48. The National Education Association estimated teachers' salaries (1959–60) to average $5,740 (high school, $5,950; elementary, $5,625).

RUTGERS UNIVERSITY

In the presence of New Jersey's Gov. Robert Meyner (center), Dr. Mason Gross (r.) is sworn in as president of Rutgers University by Chief Justice Joseph Weintraub, May 6.

NEW JERSEY SCHOOL STATISTICS, 1958–59

Type of school	No.	Teachers	Students
Public elementary (k-6)	1,665	22,012	592,429
Public junior high (7–9)	127	10,719	211,510
Public senior high (10–12)	170	9,252	171,093
Vocational and special	48	948	27,608
Junior colleges	11	192*	2,499*
Teachers colleges	6	744*	16,479*
Colleges and universities	22	4,058*	55,475*
Other higher institutions	21	188*	2,020*

* Includes full- and part-time.

Social Welfare.—In the 1958–59 fiscal year, public assistance expenditures from local, state, and federal funds (excluding institutional costs) totaled $57,606,119, including $19,370,645 for the aged, $17,617,360 for dependent children, and $6,193,942 for the permanently and totally disabled. A monthly average of 98,000 persons received assistance. State expenditures for mental health activities approximated $47,738,000; for correctional and penal programs, $9,453,000.

Labor Force.—The state's labor force totaled 2,112,500 in July 1959, including 18,500 agricultural workers. Nonagricultural employment was up to 1,931,500 from 1,892,500 in the previous July and above the average of 1,886,900 for the 12 months ending June 1959. Of nonfarm employees in July 1959, 40.3% were employed in manufacturing, 18.5% in trade, and 11.7% in government. Unemployment, which reached a post-1946 peak of 221,000 in January 1959, fell to a 19-month low of 157,400 in May 1959. By July the number of jobless had fallen to 148,000 from 216,000 a year earlier.

Manufacturing.—The 839,666 persons employed in manufacturing plants in the state during 1957 earned $4,052,986,000 in wages. Value added by manufacture totaled $7,719,418,000, and outlays for new plant and equipment amounted to $527,485,000. Production workers in manufacturing averaged $92.87 for an average workweek of 40.5 hours in August 1959.

The state continued in 1959 to acquire new industrial scientific and research facilities, and additional power sources for support of basic in-

dustry. On January 20, for example, a nuclear research reactor, considered the world's largest such privately owned facility, went into operation at Plainsboro; in May the Public Service Electric and Gas Company's $110 million generating station began commercial operation at Ridgefield Park; and on November 5 the Esso Research and Engineering Company dedicated a $7.5 million research center at Florham Park.

Mining.—In 1958 New Jersey ranked 36th among the states in the value of its mineral output, with 0.30% of the national total. Income from mineral production was at its lowest since 1954.

NEW JERSEY MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Clay	684,000	$ 2,181,000
Coke	745,362	...[1]
Iron ore, usable (long tons)	...[2]	...[2]
Manganiferous residuum	...[2]	...[2]
Peat	18,397	185,000
Sand and gravel	9,877,000	16,145,000
Stone	8,229,000	19,193,000
Zinc[3]	607	125,000
Other minerals	...	12,551,000
Total	...	$50,380,000

[1] Values for processed minerals are not included in the total. [2] Figure withheld to avoid disclosing confidential data from an individual company. [3] Recoverable content of ore. (Source: U.S. Bureau of Mines.)

Fisheries.—The commercial fish and shellfish catch in 1958 totaled 250,139,727 pounds valued at $8,888,539. Principal species were menhaden (200,327,077 pounds valued at $2,737,871) and clams (14,791,170; $2,135,286).

Agriculture.—Cash farm income for the first nine months of 1959 dropped slightly to $234,145,000 from $240,436,000 in the corresponding period of 1958. For the full year 1958, income comprised $192,042,000 from livestock and livestock products, $122,020,000 from crops, and $2,733,000 from government payments. Principal income sources in 1958 were eggs, $90,188,000, and dairy products, $63,518,000.

The state had 22,700 farms in 1958. Total acreage (1954) of 1,665,000 included 788,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 213,000 cattle and 14,371,000 chickens (excluding commercial broilers). There were 38,000 family and hired workers engaged in farming during the week of Nov. 22–29, 1959.

NEW JERSEY CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	2,715	2,500	3,400
Corn (1,000 bu.)	8,881	10,608	12,350

Tomatoes (1,000 cwt.)	847*	722	760
Wheat (1,000 bu.)	1,778	1,768	1,581

* Average, 1949–57. (Source: U.S. Department of Agriculture.)

Transportation and Communications.—State and federal spending for highways in 1958 totaled $110,727,679, and 67 miles of new state highways were completed. Under construction in 1959 was a $6 million, 2-mile freeway joining the New Jersey Turnpike to the Bergen-Passaic Expressway, and a $200 million state-federal program of road improvements, especially along the shore routes.

Highways and roads on Dec. 31, 1958, totaled 30,720 miles, all of which were surfaced. Registered *motor vehicles* numbered 2,327,022 on the same date, including 1,940,538 passenger cars. There were (1959) 27 *railroads* operating 2,012 line miles; 11 regularly scheduled *airlines;* and 149 *airports and airfields* (72 commercial and municipal, 2 military, 60 private, and 15 other).

Communications media (1959) included 26 AM and 4 FM *radio stations;* 1 VHF *television station;* 27 daily *newspapers* (circulation, 2,264,087) and 267 other newspapers (865,052); and (January 1) 695,100 business and 1,982,500 residential *telephones.*

Principal Events, 1959.—Concern with the plight of colleges and commuters engaged public interest throughout the year. After prolonged controversy the legislature enacted a college scholarship bill over the governor's veto. The measure would ultimately make available to 5% of the state's high school graduates each year $400 grants for college tuition. One fifth of the awards might go to students attending out-of-state colleges, while the remainder could be used at any public or private college in New Jersey. In order to secure funds for the expansion of physical facilities at eight state-supported institutions of higher education, the legislature authorized a public referendum on a $66.8 million bond issue.

The commuter crisis, involving principally northern New Jersey residents working in New York City, was precipitated by actual and threatened reductions in passenger train service by financially hard-pressed railroads. Many remedial plans were debated by the legislature. Ultimately an administration-sponsored proposal to use surplus funds accumulated by the immensely profitable New Jersey Turnpike to finance a solution to the problem was adopted and placed before the electorate for approval.

On November 3, the voters gave strong endorsement to the $66.8 million college bond issue and were equally decisive in rejecting the turnpike fund diversion proposal. Another public question, giving legal sanction to "amusement games" on boardwalks and in amusement parks, also won approval. A referendum forbidding Sunday sales of most commodities was approved in 12 of the 15 counties in which the question appeared on the ballot. The bond issue was implemented by the legislature on November 23.

The general election revealed little change in the relative strength of the two parties. Although the Democrats added Senate seats in Burlington and Gloucester counties to bring their total to 10, the Republicans retained a 1-vote margin. Democratic strength in the General Assembly was reduced to 34, as against 26 Republicans, because of the loss of 7 seats in Essex County and 1 in Union County. In Jersey City voters approved a proposal to create a commission to study a change in the city's form of government.

Urban renewal programs, already under way in Newark, Jersey City, Trenton, Camden, and other large communities, acquired a new dimension when the state Department of Conservation and Economic Development announced on August 3 the launching of a demonstration regional survey

of 9 northeastern counties to analyze the redevelopment and rehabilitation possibilities in that metropolitan area. Meanwhile, Rutgers University received a $750,000 grant from the Ford Foundation to undertake a program of research and service in the field of urban problems.

A comprehensive reappraisal of the state's welfare and correctional agencies, the first such study in 40 years, resulted in numerous recommendations for changes in policy and administration. The most fundamental were proposals to redefine the authority of lay boards associated with each state institution and to revise parole procedures.

An outbreak in September of Eastern equine encephalitis claimed 21 lives. The sudden appearance of a mysterious virus infection devastated the Delaware Bay oyster crop, and disclosure of contamination, by chemical spraying, of part of the national cranberry crop cut state cranberry sales.

On May 6, Dr. Mason W. Gross was inaugurated as president of Rutgers University. In June, the state opened at Island Beach its first public ocean bathing facility.

Principal Events by: RICHARD P. MCCORMICK, *Professor of History, Rutgers University.*

NEW MEXICO. Southwestern state, United States; admitted to the Union, Jan. 6, 1912. The "Sunshine State" ranks 5th in area and 39th in population among the 50 states.

Area and Population.—Area: 121,666 square miles (land, 121,511; inland water, 155), divided into 32 counties. Population: (1950) 681,187; (est., July 1, 1958) 855,000. Urban places with populations above 10,000 in 1950 (unless another date is given) are: Albuquerque, 98,815; Carlsbad, 17,975; Clovis, 17,318; Farmington (special census, Oct. 16, 1956), 15,115; Hobbs, 13,875; Las Cruces, 12,325; Roswell, 25,738; and Santa Fe, *the capital*, 27,998.

Executive.—Chief state officers in 1959:
Governor: John Burroughs (Democrat)
Lieutenant Governor: Edward V. Mead
Secretary of State: Mrs. Betty Fiorina
Treasurer: Joe Callaway
Attorney General: Hilton A. Dickson
Auditor: Robert D. Castner
Supt. of Public Instruction: Tom Wiley

Constitution and Judiciary.—The present constitution went into effect in 1912. The Supreme Court comprises five justices; chief justice in 1959 was Eugene D. Lujan.

Legislature.—The New Mexico Legislature comprises a 32-member Senate (in 1959, 24 Democrats and 8 Republicans) and a 66-member House of Representatives (60 Democrats and 6 Republicans), which meet in odd-numbered years commencing the second Tuesday in January.

In its 1959 session the legislature increased appropriations to almost $240 million for the 1959–61 biennium, without authorizing any new taxes, although provision was made to base state income tax collections on amounts reported taxable on federal income tax returns.

Legislation included increases in unemployment compensation, a new Workmen's Compensation Act, and authorization given cities to collect a 1% sales tax and to undertake urban renewal projects with federal aid. Other legislation provided for reimbursement to public utilities for facilities dislocated by highway construction; restriction of labor union picketing to matters arising out of employee-management disputes; penalties for violation of the Equal Employment Opportunity Act; revised regulations affecting finance companies; imposition of regulations on the distribution of trading stamps; and establishment of boating safety rules.

In actions affecting the structure of state government the legislature created a Radiation Technical Advisory Council, a Civil and Defense Mobilization Agency, an Archives and Public Records Commission, and a Department of Development which is to coordinate the work of the Economic Development Commission, the Tourist Bureau, and the state magazine.

Constitutional amendments approved for submission to voters provided for: continuity of the state government in the event of emergency caused by enemy attack; annual sessions of the legislature; four-year terms for elected officials; and the staggering of terms for state senators.

Finance.—In the 1958–59 fiscal year, state revenue of $283,435,582.79 comprised $104,962,599.49 from state tax sources, $76,372,624.20 from the federal government, and $102,100,359.10 from all other sources. Tax revenue consisted of $41,524,508.19 from a 2% general sales tax, $6,768,710.74 from individual income taxes, $24,503,792.11 from motor fuel taxes, $15,232,464.71 from licensing, and $16,933,123.74 from other sources. Expenditures of $285,561,963.81 comprised $52,533,571.53 for education, $23,882,855.62 for health, welfare, and safety, $63,443,302.84 for highways, and $145,702,233.82 for other purposes. Long-term indebtedness on June 30, 1959, amounted to $24,668,000.

Banking.—As of June 10, 1959, the state's 27 national banks had $488,872,000 in assets, $345,221,000 in demand deposits, and $109,092,000 in time deposits. The 26 state banks (Dec. 31, 1958) had assets of $210,911,387.89, demand deposits of $114,947,983.62, and time deposits of $42,010,022.18.

Education.—School attendance is compulsory between the ages of 6 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1958–59 fiscal year totaled $66,077,101 ($371.59 per pupil), comprising $4,460,204 from local school districts, $60,103,732 from the state, and $1,513,165 from the federal government. Outlays for construction and improvements amounted to $17,860,627, and teachers' salaries averaged $4,943 (high school, $5,071; elementary, $4,814).

NEW MEXICO SCHOOL STATISTICS, 1958–59

Type of school	No.	Teachers	Students
Public elementary (1–6)	527	4,751	124,096
Public junior high (7–9)	60	1,761	45,016
Public senior high (10–12)	107	1,469	32,328
Private and parochial elementary and secondary	109	751	23,604
Vocational and special	29	81	2,828
Junior colleges	1	14	219
Teachers colleges	3	196	3,874
Colleges and universities	3	288	8,618

Public Assistance.—In the 1958–59 fiscal year public assistance expenditures from federal and state funds (excluding institutional costs) totaled $19,324,884, including $7,611,491 for the aged, $9,401,492 for dependent children, and $1,668,871 for the permanently and totally disabled. A monthly average of 42,622 persons received assistance.

Labor Force.—The state's insured labor force totaled 163,390 persons on Dec. 31, 1958. Of this number, 159,132 were in nonagricultural employment, compared with 147,939 a year earlier and an average of 150,720 for the 12 intervening months. Some 31% of insured nonfarm employees in 1959 were engaged in trade, 16.6% in service industries, and 14.9% in construction. Insured unemployment totaled 4,258 on Dec. 31, 1958, down slightly from 4,468 at the end of the previous December.

Mining.—In 1958 New Mexico stood 8th among the states in the value of its mineral output, with 3.38% of the national total. It was first in perlite (69% of the domestic output), potash (92%), and uranium; second in helium; third in beryl (6%) and natural gas; fourth in manganese; and sixth in copper.

NEW MEXICO MINERAL PRODUCTION, 1958
(In short tons, except as noted)

Mineral	Quantity	Value
Coal	117,000	$ 719,000
Copper	55,540	29,214,000
Helium (1,000 cu. ft.)	29,793	502,000
Lead	1,117	261,000
Manganese ore	24,665	1,996,000
Natural gas (1,000 cu. ft.)[1]	761,446,000	79,190,000
Natural gasoline (bbl.)[2]	17,059,286	32,462,000
Perlite	202,046	1,790,000
Petroleum (bbl.)[1]	98,323,000	293,400,000
Potash (K_2O equivalent)	1,978,000	69,106,000
Pumice	507,000	959,000
Sand and gravel	13,205,000	11,413,000
Silver (fine ounces)	159,000	144,000
Stone	1,730,000	1,507,000
Uranium ore	1,888,499	32,264,000
Zinc	9,034	1,843,000
Other minerals	...	2,157,000
Total	...	$558,866,000[3]

[1] Preliminary. [2] Including petroleum gases. [3] Total adjusted to eliminate duplication in the value of raw materials used in the manufacture of cement and lime. (Source: U.S. Bureau of Mines.)

Manufacturing.—In the fourth quarter of 1958, there were 710 manufacturing plants in the state. In the preceding year 17,075 workers in manufacturing earned $83,641,000 in wages. Value added by manufacture (1957) totaled $166,820,000, and investments in new plant and equipment approximated $20 million. The major manufacture is that of chemicals and chemical products, employing 6,804 persons in 1957, paying wages of $45,636,000, and adding $95,767,000 in value by manufacture. In August 1959, production workers averaged $78.21 for an average workweek of 39.7 hours.

Agriculture.—Cash farm income for the first nine months of 1959 was up substantially to $105,739,000 from $87,079,000 reported for the corresponding period of 1958. For the full year 1958, income comprised $141,295,000 from livestock and livestock products, $83,990,000 from crops, and $13,344,000 from government payments. Principal income sources in 1958 were cattle, $113,969,000, and cotton lint, $42,620,000.

NEW MEXICO CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	564	714	350
Beans, dry edible (1,000 bags)	224	119	87
Broomcorn (tons)	5,370	7,900	7,300
Corn (1,000 bu.)	1,145	1,457	1,425
Cotton lint (1,000 bales)	275	301	327
Cottonseed (1,000 tons)	112	127	134
Hay (1,000 tons)	482	712	656
Peaches (1,000 bu.)	147	160	185
Sorghum grain (1,000 bu.)	4,824	8,085	8,800
Wheat (1,000 bu.)	1,895	3,806	3,849

(Source: U.S. Department of Agriculture.)

The state had 21,600 farms in 1958. Total acreage (1954) of 49,451,000 included 1,135,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 1,162,000 cattle and 1,233,000 sheep. There were 65,034 family and hired workers engaged in farming during the week of Sept. 26–Oct. 2, 1954.

Transportation and Communications.—State and federal funds disbursed for highways in the 1958–59 fiscal year totaled $66,092,749, and 441 miles of new construction were completed.

Highways and roads on Jan. 1, 1959, totaled 63,151 miles (15,382 surfaced). Registered *motor vehicles* numbered 403,632 on June 30, 1959, including 277,751 passenger cars. There were (1958) 6 *railroads* operating 2,460 line miles; (1959) 4 regularly scheduled *airlines;* and (1959) 71 *airports and airfields* (23 commercial and municipal, 4 military, 27 private, and 17 other).

Communications media (1958) included 32 AM and 2 FM *radio stations;* 7 VHF *television* stations, including one educational station; 18 daily *newspapers* (circulation, 169,923) and 44 other newspapers; and (Jan. 1, 1959) 95,800 business and 157,100 residential *telephones.*

Principal Events, 1959.—After two years of Republican administration, a Democratic governor, John Burroughs, was inaugurated on January 1. The new administration inherited a large treasury surplus and no crises in state affairs. But the turnover brought some internal dissension within Democratic ranks over appointments and policies. A major problem facing the administration involved the powerful Highway Commission and its handling of the acquisition of road-building materials, the construction of the Lordsburg highway, and other matters. Investigations were undertaken by the state attorney general and a special House committee.

The 24th New Mexico Legislature, dominated by Democrats from the five eastern counties, enacted most of the governor's program. It was feared, however, that the state's proposed increased spending would exceed income, despite additional revenue expected as a result of improved income tax collection procedures (see above, *Legislature*).

In May a short-lived system of "voluntary" contributions by state employees of 1% of their salaries to the Democratic Party was halted by the governor. He admitted his mistake "in allowing this plan to be put into effect in spite of . . . personal misgivings."

Water continued to be a serious problem for the state in 1959. A step toward its solution was the awarding in February of a contract for construction, under supervision of the Corps of Engineers, of Abiquiu Dam. The second-highest earth-filled dam to be undertaken by the corps, it is a major part of the Rio Grande flood-control program. In March the governor signed a bill financing construction of the Canadian River Dam in eastern New Mexico, and the U.S. Congress authorized building of the San Juan–Chama transmountain diversion and the Navajo irrigation projects at an estimated cost of $220 million. (See also DAMS.)

In February the U.S. Atomic Energy Commission set off, near Carlsbad, the first test explosion of its Project Gnome series for developing peaceful uses of nuclear energy. The commission reported in December that $357 million had been spent in the state through June 30, 1959.

The state's important mining industry experienced a mixed year. Final figures were expected to reveal declines in potash and copper output and fairly stable uranium ore production. Northwestern New Mexico, however, continued to show production increases, especially of oil, gas and uranium. The state's copper mining operations were seriously affected by walkouts in Kennecott Copper Corporation mines.

Other economic factors were more encouraging. As early as March, nonfarm employment was 16,100 over the previous year's figure for the same month. Ranchers, benefiting from good range conditions and high prices, anticipated a banner year, with cash receipts from livestock and livestock products expected to be $40 million higher than for the previous year. Crop income was also up, with the cotton yield showing a big hike and with winter wheat experiencing its best harvest since 1949.

A record tourist season was indicated for 1959. Highlights of the year included an excellent opera season at Santa Fe, the dedication of a new museum in Roswell, and the opening of a new folklore center in Tucumcari, the Mesilla Design Center near Las Cruces, the Ghost Ranch Nature Museum near Abiquiu, and Pancho Villa State Park, south of Deming.

Principal Events by: DOROTHY WOODWARD, *Professor of History, University of New Mexico.*

NEW YORK. Middle Atlantic state, United States; one of the original 13 states. The "Empire State" ranks 30th in area and first in population among the 50 states.

Area and Population.—Area: 49,576 square miles (land, 47,944; inland water, 1,632), divided into 62 counties. Population: (1950) 14,830,192; (est., July 1, 1958) 16,313,000. Incorporated places with populations above 20,000 (as estimated by the State Department of Health for April 1959) are:

Albany (*capital*)	143,351	Gloversville	24,208

Executive.—Chief state officers in 1959:
Governor: Nelson A. Rockefeller (Republican)
Lieutenant Governor: Malcolm Wilson
Secretary of State: Mrs. Caroline K. Simon
Comptroller: Arthur Levitt
Attorney General: Louis J. Lefkowitz
Commissioner of Education: James E. Allen, Jr.

Constitution and Judiciary.—The present constitution went into effect in 1894. The highest tribunal, the Court of Appeals, comprises seven justices; chief justice in 1959 was Albert Conway.

Legislature.—The New York Legislature comprises a 58-member Senate (in 1959, 34 Republicans and 24 Democrats) and a 150-member Assembly (92 Republicans and 58 Democrats), which meet annually commencing the first Wednesday after the first Monday in January. Major enactments of the 1959 session included measures which accomplished the following:

Budget and Taxation.—Approved appropriations of $2,021,000,000 for the fiscal year 1959–60, with 52% of the total assigned as grants to local governments. Established a withholding system for personal income tax collection and revised the exemption and rate structure. Cancelled 1958 income taxes except for capital gains and estate and trust taxes. Increased inheritance taxes and raised taxes on the following: cigarettes, to 5 cents per pack; other tobacco products, by 15% on the wholesale price; and gasoline and diesel fuel, except supplies for buslines and taxis, to 6 cents and 9 cents per gallon, respectively. Hunting and fishing license fees were raised, and harness and thoroughbred racing seasons were extended (with the daily number of races increased) to expand returns from parimutuel betting.

Education.—Appropriated $773 million for education, of which $622 million was for state aid to schools. Authorized the State Dormitory Authority to build facilities in private as well as public colleges. Required school districts with 8 or more mentally retarded children to establish special classes and provide school transportation for these children.

Administration and Judiciary.—Established offices of Local Government and of Transportation in the Executive Department. Set up temporary commissions on Revision and Simplification of the Constitution and on Economic Expansion. Proposed establishment of an independent state Department of Motor Vehicles (the proposal was approved by the voters in November). Increased the salaries of state civil service, legislative, and judicial employees. Passed a constitutional amendment (approved by the voters) which would combine various inferior courts, set up a statewide family court, ban county judges from practicing law, establish a district court system eliminating justices of the peace and police magistrates in upstate counties, and give general policy supervision of the court system to the administrative board of the Judicial Conference.

Labor.—Labor unions were required to submit financial reports; their officials were prohibited from having financial interests in industries with which they negotiate contracts; and management was forbidden to coerce union officials. Extended unemployment insurance coverage and sickness disability and workmen's compensation coverage. Permitted injunctions in labor disputes involving transportation of perishable goods.

New York City.—Authorized new or increased taxing powers for the city (see NEW YORK CITY); created a commission to study possible improvements in city government; authorized sale of subway power plants; approved a code of ethics for city officials; and gave $5 million in new state aid to city, including $2.7 million for city colleges.

Miscellaneous.—Established an Office for Atomic Development, a Municipal Police Training Council, and a Division of Motor Boats. Set up a staggered system for the issuance of motor vehicle and drivers' licenses and authorized permanent license plates with annual tags. Extended narcotics sales convictions to a maximum of 15 years. Enacted immediate and long-range local tax relief for railroads and provided compensating state aid to municipalities covering 50% of their losses from such taxes. Approved a $20 million loan to the Port of New York Authority for the purchase of commuter equipment for the New York Central, Long Island, and New Haven railroads. Authorized (subject to New Jersey concurrence) a bistate agency to plan a solution to commuter problems.

Constitutional amendments approved by the voters in the November elections included the requirement of public officials to testify at pertinent investigations of their conduct in any office held within the past five years; elimination of uncontested primaries; uniform definitions of income in state and federal income tax returns; the borrowing of money or levying of taxes by local governments for projects conducted jointly with other localities; the lease or transfer of the state barge canal system to the federal government; construction of a state highway in the Adirondack forest preserve; and the raising of retired police and firemen's pensions (and those of their widows) by municipalities.

Finance.—State disbursements are made from several funds, chief of which are the General Fund, to which $1,550,350,057.88 was allotted in the 1958–59 fiscal year; and the Capital Construction Fund, for which $257,475,-767.91 was designated. State tax sources (for General Fund revenue) consisted of $565,758,966 from personal income taxes, $386,881,662 from general business taxes, $427,083,765 from excise taxes on consumption, and $175,324,956 from other sources. Construction Fund expenditures totaled $242,745,594. General Fund expenditures included $590,980,527 for state purposes (the chief item being $250,386,636.46 for state institutions) and $928,694,888.74 for local assistance purposes (including $560,668,001.06 for education and $151,250,791.75 for social welfare). Net state indebtedness on March 31, 1959, comprised $867,383,259.27 in bonded debt and $29,625,-325.10 in temporary debt.

Banking.—As of June 10, 1959, the state's 255 national banks had $12,016,749,000 in assets, $7,074,193,-000 in demand deposits, and $3,321,271,000 in time deposits. The 163 state banks (June 30, 1959) had assets of $34,313,427,000, demand deposits of $23,745,275,000, and time deposits of $6,286,638,000.

Education.—School attendance is compulsory between the ages of 7 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1957–58 school year totaled $1,328,651,873 ($587.49 per pupil), and revenue comprised $773,978,879 from local school districts, $514,753,794 from the state, and $4,237,887 from the federal government. Outlays for construction and improvements amounted to $398,429,705, and teachers' salaries averaged $6,037.

NEW YORK SCHOOL STATISTICS, 1957–58

Type of school	No.	Teachers	Students
Public elementary (k-6)	3,847[1]	60,958	1,632,792
Public junior high (7–9)	...	...[2]	571,707
Public senior high (10–12)	1,429[1]	51,525	454,370
Private and parochial elementary and secondary	1,823	23,000	805,700
Junior colleges	35	1,579	30,941
Teachers colleges	11	1,361	19,018
Colleges and universities	117	25,937	314,885

[1] Represents number of buildings, including 724 used for both elementary and secondary. [2] Included in senior high.

Public Assistance.—In the calendar year 1958, public assistance expenditures from local, state, and federal funds (excluding institutional costs) totaled $312,088,725, including $101,828,347 for the aged, $121,427,603 for dependent children, and $44,139,320 for the disabled. A monthly average of 505,541 persons received assistance.

Labor Force.—In mid-1959 the state's labor force totaled 7,575,000 persons. Nonagricultural employment of 5,949,200 exceeded the figure of 5,906,500 reported for mid-1958 and the 5,950,600 average for the 12 intervening months. Of employed nonfarm workers in July 1959, 30.9% were engaged in manufacturing, 20.2% in trade, and 15.2% in service and miscellaneous industries.

Active claimants for unemployment insurance in August 1959 numbered 229,445, which was below the 10-year average of 289,518 and well beneath the 324,144 figure for the previous August, at which time temporary unemployment insurance programs were covering an additional 81,640 workers.

Manufacturing.—In 1957 the 2,065,377 persons employed in manufacturing plants in the state received $9,615,521,000 in wages. Value added by manufacture totaled $16,509,025,000, and outlays for new plant and equipment amounted to $728,-400,000. Production workers averaged $87.28 for an average workweek of 29.4 hours in August 1959.

THE NEW YORK TIMES

U.S. Navy vessel, welcomed by fireboat and crowds at Battery Park, sails up New York Harbor, June 11, on opening day of summer-long celebration marking the 350th anniversary of Hudson's discovery of the river named in his honor.

MAJOR NEW YORK MANUFACTURES, 1957

Product or industry	Average no. of employees	Salaries and wages (thousands of dollars)	Value added by mfr.* (thousands of dollars)
Apparel and related products	391,027	$1,300,264	$2,297,702

Stone	22,598,000	38,219,000
Zinc	53,014	10,815,000
Other minerals	...	62,170,000
Total	...	$204,920,000[4]

[1] Figures withheld to protect individual company's confidential data. [2] Values for processed materials are not included in the total. [3] Preliminary. [4] Total adjusted to eliminate duplication in the value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1959 totaled $626,676,000, compared with $631,082,000 for the corresponding period of 1958. For the full year 1958, income comprised $619,803,000 from livestock and livestock products, $229,820,000 from crops, and $9,095,000 from government payments. Principal income sources in 1958 were dairy products, $434,167,000; cattle, $76,624,000, and eggs, $63,684,000. Greenhouse and nursery products yielded $52,934,000.

NEW YORK CROP STATISTICS

Crop (and unit of production)	Average 1948–57	1958	Est. 1959
Apples (1,000 bu.)	16,469	22,000	18,500

There were 100,000 farms in the state in 1958. Total acreage (1954) of 15,071,000 included 5,547,000 acres in harvested cropland. Livestock on farms (Jan. 1, 1959) included 2,153,000 cattle and 10,244,000 chickens (excluding commercial broilers). There were 154,000 family and hired workers engaged in farming during the week of Nov. 22–29, 1959.

Transportation and Communications.—Progress continued on the New York Thruway in 1959. The final six miles of its $54 million Berkshire section, connecting south of Albany with the Massachusetts Turnpike and including a $17 million bridge at Castleton-on-Hudson, was opened on May 26, and in Buffalo and vicinity, eight miles of the Niagara sector were opened on July 30, leaving several additional miles of the Niagara portion to be completed in 1960 to close out all construction of the 559-mile Thruway project. A $303.7 million highway program for the 1959–60 fiscal year was begun on April 2, 1959.

At the November 1959 state election, voters approved routing the Albany-to-Canada Northway through to Adirondack Forest Preserve.

Total state and federal spending for New York *highways* in 1958 amounted to $488,964,237, and 164 miles of state system highways were completed. Highway and road mileage on Dec. 31, 1958, totaled 105,640 (92,005 surfaced). Registered *motor vehicles* numbered 5,054,678 on the same date, including 3,977,650 passenger cars. There were (1958) 45 *railroads* operating 6,725.99 line miles and (1959) 43 regularly scheduled *airlines.* There was a total of 240 *airports and airfields* (94 commercial, 47 municipal, 11 military and 88 private), 33 seaplane bases, and 7 heliports.

Communications media (1959) included 125 AM and 41 FM *radio stations;* 22 VHF and 2 UHF (including 1 educational unit at Buffalo) *television stations;* 112 daily *newspapers* (1957 circulation, 8,483,239) and 542 other newspapers; and (Jan. 1, 1959) 2,550,600 business and 5,605,800 residential *telephones.*

Principal Events, 1959.—An event affecting an enormous number of residents of New York State in 1959 was the modification of the state's taxation system. Changes effected early in the year included forgiveness of 1958 state income taxes, the imposition of new taxes expected to produce over $277 million during the year, and adoption of a withholding system for collection of state income taxes. Taxes were increased on gasoline, diesel fuel, and cigarettes. Payroll deductions of 1959 income taxes by employers became effective April 1. The withholding system was expected to affect nearly 6 million state inhabitants.

There were, however, a number of more cheering aspects of the state's economic situation in 1959. Before the end of April, the increase in employment greatly exceeded seasonal expectations. Consumer prices at that time, too, had risen only 0.4% above those for the comparable period of 1958. By June, however, prices were 1.2% higher than they had been a year earlier. Although the fairly consistent continuing increase in employment was checked during a part of the third and fourth quarters of 1959 by the effects of the 116-

day steel strike, the generally high level of employment, increasing volume of retail trade, and large expenditures for plant construction and equipment during the final months of the year provided a reassuring prospect for at least the first half of 1960. Of great importance to New York State's future economic development was the opening in June of the St. Lawrence Seaway and Power Project (q.v.).

Early in 1959, Gov. Nelson A. Rockefeller took steps to obtain enactment of legislation to curb the alarming number of crimes being committed throughout New York State. Specific proposals which he made to the legislature—and which produced a favorable response from that body—included the strengthening of investigative and police agencies, closer cooperation of state and local law enforcement officials, more severe penalties for law violators, and improvement of statistical data on crime. During September, major crimes increased 3.6% over the number committed in August, but were slightly fewer than for September 1958.

In the statewide off-year election of November 3, nine proposed amendments to the state constitution were the chief focal points of public interest. The proposed amendment most hotly debated was one which would have permitted New York City to issue $500 million in school construction bonds beyond its existing debt limit. A majority of the upstate as well as New York City electorate voted against this amendment. The remaining proposed amendments (see above, *Legislature*) were approved by varying margins. The large number of proposed amendments stimulated, as some earlier elections had done, a demand for the holding of a state constitutional convention. Defeat of the school construction bond amendment was widely interpreted as resulting from voter concern regarding governmental spending and the increasing of an already heavy burden of taxes.

On January 5, Governor Rockefeller officially proclaimed 1959 as a "Year of History" for New York State. Many communities participated in the ensuing celebration of not only the 350th anniversary of explorations made by Henry Hudson and Samuel de Champlain in what is now New York State, but in commemorating numerous other significant events. One of the most important events commemorated was the founding (1784), 175 years earlier, of the Board of Regents of the University of the State of New York.

NEW YORK CITY. This seaboard metropolis is the most populous city in the United States and is the nation's leading commercial, industrial, and cultural center. Covering 319.13 square miles, the city contained some 7,795,471 inhabitants in April 1957, compared with a 1950 census population of 7,891,957.

New York City is governed by a mayor (Robert F. Wagner, Jr., Democrat, re-elected on Nov. 5, 1957) and a 25-member New York City Council. Each of the five boroughs of the city (the Bronx, Brooklyn, Manhattan, Queens, and Richmond) has its own president. The Board of Estimate, composed of the mayor, comptroller, president of the City Council, and the five borough presidents, is the city's top governing body.

One of New York City's major problems in 1959 was that of financing the city's many and vast operations. In February Mayor Wagner sought Gov. Nelson A. Rockefeller's help in obtaining permission from the Republican-controlled Legislature for the city to levy $144,500,000 in new taxation. In March legislation was enacted at Albany to permit the city to levy $125 million more in local taxes. Under this permission the city increased its existing taxes on cigarettes, restaurant meals, and gross business receipts, and imposed new taxes on taxicab rides, juke boxes, and real estate sales above $25,000. This additional taxation aroused much opposition.

WIDE WORLD

New York City's Police Commissioner Stephen Kennedy (l.), with Deputy Commissioner Alexander Aldrich, testifies before Senate subcommittee investigating juvenile delinquency, September 23. Young offenders' weapons are on table.

On April 1 Mayor Wagner submitted to the Board of Estimate a record $2,173,113,999 city expense budget for the 1959–60 fiscal year. The budget approved by the Board of Estimate, April 27, was for $2,174,946,957, $182,993,971 more than for the preceding year. On June 25 the City Council approved a 1959–60 basic tax rate of $4.16 for each $100 of assessed valuation of real property, with borough rates to run from 2 to 9 cents higher than for the 1958–59 fiscal year. The total assessed valuation of taxable real property in the city was set at $23,549,007,007 for 1959. This was an increase of $1,098,722,060 over the 1958–59 total. The Citizens Budget Commission announced, March 15, that the city's net debt of $3,225 million was approximately four times larger than that of any other city in the United States. By June 30 the city's gross funded debt was $4,136,564,303; by September 30 it had risen to $4,143,605,919. On Nov. 1, 1959, Comptroller Lawrence E. Gerosa announced that the city's expense budget revenues for the 1958–59 fiscal year were $3,169,787 larger than expenditures.

New York City continued to be the nation's leading port. The volume of steamship traffic in the Port of New York rose markedly during the first six months of 1959, with 682 more oceangoing ships entering and leaving than during the comparable 1958 period. There were 13,713 vessel arrivals and departures during the first half of 1959, compared with 1958's half-year figure of 13,031 and full-year total of 26,281.

That New York City's economy was by mid-1959 making substantial recovery in economic areas which had been hardest hit by the recession of 1958 was indicated in a report by the Department of Commerce and Public Events, July 14. This report showed that more workers were migrating to New York City from Puerto Rico and certain other areas in 1959 than in 1958, that the number of help-wanted advertisements in metropolitan newspapers had greatly increased, and that residential building plans had been expanded. Total wage and salary employment in 1958 had averaged 3,449,000 weekly, of which 937,300 were engaged in manufacturing (including 264,600 in the leading apparel industry), 735,100 in wholesale and retail trade, 565,000 in the service and related occupations, and 401,000 in local, state, and federal government.

The year 1959 opened with a continuation of the building construction boom, especially office structures. In early January, 16 skyscrapers, with a record-breaking total of 5,574,000 square feet of floor space, were scheduled for completion in Manhattan alone in 1959. Nine additional skyscrapers under construction there were expected to be completed in 1960–61. By early November, however, a somewhat tighter money situation and a long-continued nationwide steel strike (see IRON AND STEEL) suggested a lessening of building construction by mid-1960.

Other construction developments of 1959 included the breaking of ground on August 13 for the $320 million Narrows Bridge (see BRIDGES)

and on May 15, with President Eisenhower participating, for the $75 million Lincoln Center for the Performing Arts (see MUSIC). Opened during the year were two huge new passenger terminals at New York International (Idlewild) Airport, the new Brooklyn Pier 1, and the spacious new Aqueduct race track in Queens.

On January 22 the Board of Estimate approved in principle a $1 billion redevelopment plan for lower Manhattan. High-rent apartment house construction also boomed throughout 1959. The state Public Works Department announced, April 3, that, as part of a $303,700,000 state highway program for the fiscal year 1959–60, expressway construction eventually costing $135 million would be started in New York City.

Residential housing conditions in the city underwent no major changes during 1959. While luxury apartment house construction flourished, low-rental apartments remained scarce. The city Housing Authority announced, February 1, proposals for the beginning of three new, low-rental housing developments: two in Brooklyn and one in the Bronx. The city government, in cooperation with settlement houses, was by mid-October engaged in implementing a program of slum reduction in Chelsea, the upper West Side, downtown Brooklyn, and east Harlem.

The year 1959, in contrast to 1958, was marked by numerous crippling strikes in New York City. These included a strike which had been started on Dec. 19, 1958, by American Airlines pilots, and which ended on January 11; a brief National Maritime Union tugboat strike in February; a 46-day strike starting May 8 and ending on June 22 by nonprofessional workers at six (later seven) of New York's 148 nonprofit hospitals; and an 8-day strike in early October by 85,000 members of the International Longshoremen's Association.

The Police Departments' tabulation, near the end of October, on crime complaints in New York City for the first nine months of 1959 presented a gloomy picture. It revealed an increase of 2.2% in total complaints over the comparable portion of 1958. Police Commissioner Stephen P. Kennedy, on October 26, attributed this increase in part to a growing amount of youth violence, especially during the summer months. (See also CRIME.)

On January 4, the Board of Education announced a $72,600,000 school construction program for 1959. This represented a sharp reduction of the board's originally proposed budget of $105,600,000. Much controversy developed later in the year over school construction financing, a subject which became the major political issue in the subsequent general election.

That election was the most important political event of the year in New York City. The primary election was held September 15. In this contest Carmine G. De Sapio, against whom a strong fight was waged by Democratic party insurgents, retained his district leadership by a slight margin. On September 22 he was elected Democratic chairman of New York County. The number of persons in New York City eligible to vote in the general election totaled 2,802,154, compared with 2,665,334 in the 1958 election. The main focal point in the 1959 election in the city was a school bond issue, one of nine proposed amendments to the state constitution. This question was submitted to the voters, and was turned down by them in the November 3 election. The proposed bond amendment would have permitted the city to issue $500 million in school construction bonds beyond its debt limit. The city vote alone on this proposed amendment (No. 4) was 494,544 in favor to 739,884 against. Each of the other eight proposed amendments was approved by the city and upstate voters by varying margins. In a highly publicized contest for Queens Borough president, incumbent John T. Clancy (Democrat) decisively defeated Robert E. Barnes (Republican) and Leo Brown (Liberal). Democratic Party candidates also won in the race for judgeships in the Court of General Sessions, and were generally successful in other city contests.

After the city served as host to the Soviet Exhibition of Science, Technology, and Culture in the summer of 1959, public announcement was made on October 29 that a world's fair would be held in New York City in 1964. That year will be the 300th anniversary of the capture of New Amsterdam by the English and their renaming it New York.

NEW ZEALAND. Defined by the Statute of Westminster (1931) as an autonomous, freely associated member of the Commonwealth of Nations, New Zealand comprises two principal islands lying some 1,200 miles southeast of Australia in the South Pacific Ocean: North Island (44,281 square miles) and South Island (58,093), with adjacent Steward Island (670) and Chatham Islands (372). Minor outlying groups include the Auckland Islands (234 square miles), Campbell Island (44), and the Antipodes Islands (24). New Zealand also administers the island territories of Cook (with associated islands, 90 square miles), Niue (100), Tokelau or Union (4) and Kermadec Islands (13), Western Samoa (see SAMOA), and the Ross Dependency (175,000 square miles) in the Antarctic. Jointly with the United Kingdom and Australia, New Zealand is a trustee of Nauru (q.v.).

Population.—New Zealand's population was 2,326,129 (Maoris, 152,643) on March 31, 1959, compared with a total 12 months earlier of 2,275,515 (Maoris, 147,118). Excluded from the 1959 figures were the populations (Dec. 31, 1958) of Cook Islands (17,654), Tokelau Islands (1,749), Western Samoa (102,860), and of Niue Island (4,719 at March 31, 1959).

Urban areas of principal cities had the following estimated populations (including Maoris) as of April 1, 1959: Wellington, 143,200 (Wellington City, the capital, 123,000); Auckland, 413,100 (city, 141,000); Christchurch, 210,000 (city, 149,400); Dunedin, 102,500 (city, 72,200); and Hutt 93,000 (Lower Hutt City, 52,800). Net immigration added 13,867 to the population in 1958–59, compared with a gain of 18,146 from this source in 1957–58. Immigrants from Commonwealth countries intending permanent residence totaled 21,352 (from the United Kingdom, 13,189) in 1958–59; from all other countries, 3,500 (United States, 694).
